Populism has been more widely studied in the Americas and Europe. North America has seen numerous cases of unquestionable populism. For instance, in the United States, a range of political leaders including Ronald Reagan (1911–2004) and Sarah Palin (1964–) have been defined as populists for their appeal to the “common man” to struggle against the “corrupt elites” of Washington (Lowndes, 2018). In the 2016 Presidential elections, two populist figures, one in the right (Donald Trump) and one in the left (Bernie Sanders), (more or less) successfully challenged non-populist candidates. They mobilized a huge majority of American voters (Hawkins et al., 2017). Trump successfully appealed to the “common” Americans, against Muslims, women, Latin American immigrants and his political opponents overall (Inglehart and Norris, 2016). Bernie Sanders, in contrast, was closed to be nominated Democratic candidate, with a discourse attacking “big corporations, big donors, and big banks” (Inglehart and Norris, 2016, p. 5). While many argue that Trump is undoubtedly populist, there is academic and public debate about whether Sanders is or is not (Sant, 2021).

A relatively high number of Latin American political movements, parties and leaders have been qualified as populists. During the 1930s and the 1940s, leaders such as Juan Perón (Argentina) and Getúlio Vargas (Brazil) successfully obtained power after performing various collective actions, including mass rallies. Whether later politicians in early 1990s (e.g., Carlos Menem in

Argentina and Alberto Fujimori in Peru) were populists is still controversial. According to [De La Torre \(2017\)](#), these political leaders were “neoliberal populists”. They blamed traditional politicians for the economic situation of their countries and, once in power, imposed austerity and privatizations reforms based on the recommendations of the International Monetary Fund (IMF). At the beginning of the 21st century, Hugo Chávez, Evo Morales, and Rafael Correa became the images to illustrate left populism: they “defended the people” against neoliberal practices and the “intrusion” of IMF, the World Bank, and the US government in Latin American politics ([Panizza, 2008](#)). Some years later, Jair Bolsonaro capitalized on political uncertainty in Brazil, and with a discourse framed by racism, homophobia, sexism and military authoritarianism won the elections in October 2018 ([Gledhill, 2019](#)).

In contemporary Europe, who is and who is not populist has been a long controversy. Were the 1920s and 1930s totalitarian movements (i.e., Nazism and fascisms) populists ([Müller, 2017](#))? While many academics appear to disregard such association, the potential links between fascism, racism and populism have nurtured the European demonization of populists ([Mudde and Rovira Kaltwasser, 2012](#)). Indeed, many political scientists argue that, beyond the *narodniki*, modern populism is a relatively new phenomenon in Europe. In the 1990s, populist parties emerged in Central and Eastern Europe as a reaction of the “losers” of the liberal politics introduced during post-communist transition against the elites who implemented these reforms ([Stanley, 2017](#)). Later parties have further used the uncertainties created by rapid changes to gain the electorate. For instance, Law and Justice (*Prawo i Sprawiedliwość*, PiS) drawn upon the frustration of those experiencing the grievances of economic crisis, liberal policies, political corruption, and Russian intrusion ([Sztompka, 2016](#)). South and Western Europe have also experienced a rise of populist movements. For instance, in Greece and Spain, left-wing movements have secured some political power. The Greek coalition SYRIZA gained power in 2015 with a discourse against the corrupted elites and more, particularly against the politics of austerity fostered by the *troika* (European Commission, European Central Bank and IMF) ([Stavrakakis and Katsambekis, 2014](#)). In Spain, *Podemos* (We can) entered the coalition in 2019 with a discourse against the political, economic and judicial elites accused of corruption and keeping Franco’s dictatorship alive ([Franzé, 2017](#)).

Meanwhile, right-wing populist parties have also expanded their number of electors. In The Netherlands and France, Geert Wilders and Marine Le Pen’s National Rally (former *Front National*) foster a populist discourse against Muslim migration. The Brexit Referendum (the 2016 United Kingdom European Union membership referendum) is often considered a populist movement. Simultaneously, so-called populist infiltrated mainstream parties. Boris Johnson (UK First Minister) and Jeremy Corbyn (former Labor party leader) were the two leading candidates in the 2019 United Kingdom general election. While many saw in Johnson the clear image of populism, many others questioned that Corbyn was a populist himself. And yet, the opening lines of Corbyn’s first speech of the 2017 campaign were,

“The dividing lines in this election could not be clearer from the outset ... It is the establishment versus the people and it is our historic duty to make sure that the people prevail ... We don’t fit in their cosy club. We’re not obsessed with the tittle-tattle of Westminster or Brussels. We don’t accept that it is natural for Britain to be governed by a ruling elite, the City and the tax-dodgers, and we don’t accept that the British people just have to take what they’re given, that they don’t deserve better.”

Quoted by [Flinders \(2018, p. 233\)](#).

Who is and who is not a populist is not an easy question to answer.

Is populism a democratic threat?

One of the main reasons populism matters for education is that populism is often conceived as a democratic threat. Democracy is an ambivalent term with many meanings, but authors usually define democracy in terms of equality and popular sovereignty ([Sant, 2019a, 2021](#)). Many academics in education believe that populism challenges equality; they argue that “the people” is simultaneously constructed against the elite and the immigrant Other who is racialized and considered an enemy that needs to be expelled (e.g., [Osler and Starkey, 2018](#)). If that is the case, populism uncontestedly damages the democratic principles of equality. However, the way this perspective conceptualizes populism is challengeable. According to [Stavrakakis and Katsambekis \(2014\)](#), this perspective fails to understand that populism is not necessarily associated with nativist or far-right-wing attitudes. Many populists struggle against racism and inequality. Extreme right politics are a democratic threat—regardless of whether these politics are populists or not, the relationship between populism and democracy is more complicated.

In many countries, democracy is often understood as synonymous of liberal or representative democracy. Liberal democracy favors both equality and popular sovereignty (democracy) and individual liberty, separation of powers and the rule of law (liberalism). Populism emphasizes popular sovereignty (the will of the people) but not through the liberal principles of separation of powers and the rule of law. For instance, in the United Kingdom, after the results of the Brexit Referendum, many of those supporting to leave the European Union argued that the people had decided and the parliament should stop discussing and “just” deliver Brexit. [Rovira Kaltwasser \(2012\)](#) explains, “[p]opulism assumes that once ‘the people’ have spoken, nothing should constrain the implementation of its will” (p. 195). Most academics appear to agree that populism privileges the rule of the people and that this can represent a threat to the existing authority. However, this does not make populism necessarily

a democratic threat but rather a threat to liberal democracy. [Martinelli \(2016\)](#) argues, “[p]opulism is not anti-democratic (...), but it implies an illiberal version of democracy” (p. 13).

More widely, [Canovan \(1999\)](#) and [Arditi \(2004\)](#) define populism as a shadow of democracy. In their perspective, any democratic system requires a balance between ideal and pragmatic politics. Ideal democracy responds to the rule of the people—the “utopian” situation in which there is no gap between public and power, where the people, as a political community, have all control to self-govern, and where self-government totally satisfies all members of this community. Pragmatic politics, in contrast, focuses on solving everyday disputes through institutions—the rule of law—that give answers to such disputes. Populism, as mentioned, considers the rule of the people is non-negotiable and, in doing so, utilizes the internal mismatch between ideal and pragmatic democracy. Populists draw upon the fact that pragmatic politics are seen as elitist and irresponsible because they cannot deliver the will of the people in a fast and satisfactory manner. Populism appeals to the ideal face of democracy and questions the irresponsible elitism of its pragmatic mechanisms. From this perspective, populism is not a democratic threat, but it evidences how the rule of the people and the rule of law can challenge each other.

Is populism a consequence of educational failure?

Social and political scientists have emphasized the importance of understanding the role education plays in populism. In 2016, [Runciman \(2016\)](#), a well-known professor of politics, wrote a newspaper article entitled “[h]ow the education gap is tearing politics apart”. Indeed, empirical research in sociology and political science has suggested that those graduated from colleges and universities rarely vote populist leaders. Those with lower or no educational qualifications are more likely to support populist alternatives ([Goodwin and Heath, 2016](#); [Inglehart and Norris, 2016](#)). This relationship has been proved in different contexts, including Belgium, The Netherlands, the United Kingdom and the United States. For instance, in the Brexit referendum, while over two-thirds of those without qualifications voted to leave, only a quarter of those with postgraduate qualifications did so ([Hobolt, 2016](#)). The twenty “most educated” areas voted to remain, whereas fifteen of the twenty “least educated” areas voted to leave ([Goodwin and Heath, 2016](#)). In the 2016 US Presidential elections, Trump enjoyed a narrow margin of four points over Hillary Clinton among white college-educated, but a vast advantage of 40 points among the non-college-educated ([Schaffner et al., 2018](#)). It has been argued that even considering other factors (e.g., age, gender, region, ethnicity, social class), education remains one of the most (if not the most) important cleavages ([Goodwin and Heath, 2016](#); [Hobolt, 2016](#); [Runciman, 2018](#); [Schaffner et al., 2018](#)).

However, this relation appears to be more complex. In the United Kingdom, [Dorling et al. \(2016\)](#) have suggested that, as for the Brexit vote, it is very difficult to separate educational attainment from age. A master’s degree in 2016 could be equivalent to a good post-16/pre-university qualification on 1946. The Brexit vote cannot fully be examined without considering historical dynamics and the hidden experiences of those who did not vote. Several left-wing populist European parties have the support of a highly educated population ([Ramiro, 2016](#)). For instance, [Ramiro and Gomez \(2017\)](#) have shown how a sector of *Podemos* electorate in Spain comprises university-educated young professionals in situations of economic insecurity. In 2017 United Kingdom general elections, the Labor party experienced a surge of young university-educated voters who felt appealed by the populist nature of Corbyn’s discourse ([Sloam and Henn, 2019](#)). In the United States, there are not apparent educational differences between those who supported Bernie Sanders or those who supported other (non-populist) Democratic candidates ([Dyck et al., 2018](#)). Similar demographic patterns have been found in numerous Latin American countries ([Remmer, 2012](#)).

The relation between populism and education appears to be context-dependent, but this has not stopped academics to explore why this relationship exists. There are four different hypotheses. First, there is a cognitive hypothesis. [Inglehart and Norris \(2016\)](#) explicitly refer to knowledge and cognitive skills to justify this relation. Similarly, [Spruyt et al. \(2016\)](#) explain, “[t]his relationship is to a certain extent mediated by the indicators that refer to the more evolved cognitive aspects people acquire through education” (p. 8). There is a second status hypothesis. Some argue that this relation is a consequence of the status effect of education; those who have a higher educational qualification are more likely to have better career opportunities, higher salaries and overall to gain higher socio-economic status ([Inglehart and Norris, 2016](#); [Spruyt, 2014](#)). Achieving a higher degree makes one less likely to be/become left behind by neoliberal globalizations ([Teney et al., 2014](#)). Meanwhile, non-college educated (often male) feel resentment against higher educated elites for their lost of status ([Cohen, 2019](#)). The cognitive and status hypothesis implicitly see populism as a result of educational failure: populists have not gained an education and therefore have not acquired knowledge and skills and the jobs and income expected to accompany those learnings.

The third hypothesis is the socializing hypothesis. Some have explained this potential division in terms of the socializing effects of schooling practices ([Inglehart and Norris, 2016](#); [Spruyt et al., 2016](#); [Spruyt, 2014](#)). Those who spend longer in education are more likely to be socialized into normative frameworks that might challenge populist discourses. There is also the possibility (i.e., fourth hypothesis) that individuals might have educational identities and that these identities might fuel/prevent alignment with populist discourses ([Runciman, 2018](#); [Spruyt, 2014](#)). [Bovens and Wille \(2017\)](#) and [Spruyt \(2014\)](#) defend the conflict hypothesis: the existence of a perceived educational conflict between higher and lower educated. They explain the rise of populism as a revolt of the lower educated that might be seen as the emergence of “the people” as a collective actor ([Laclau, 2007](#)). In contrast with the cognitive and the status hypothesis, the socializing and the conflict hypothesis offer a much more nuanced account signaling that populist

and no-populists might have different life (including educational) experiences that might favor them to see the world in different ways. [Runciman \(2018\)](#) explains,

"One of the largest divides in a twenty-first-century Western democracy is produced by education. Whether or not someone went to college is a more significant determinant of how they are likely to vote than age, class or gender. (...) The educated are a tribe. They stick together. They may tell themselves that they do this because they have a better understanding of how the world works. But that's what makes them so alienating to the other side: they appear to mistake their tribalism for superior wisdom" (pp. 163–164).

These two hypotheses also help to explain why the potential relationship between populism and education outlined above is quite "clear" in some cases, and it is not that clear in others. Here, the sum of different life experiences (with education being an essential part of them) creates our "tribes", and we vote the same that members of our "tribes" regardless of whether we vote populist or not populist alternatives.

Should education struggle against populism?

Many believe that education should struggle against populism. Often driven by concerns about the health of liberal democratic systems (see above), different policymakers and academics have emphasized the role of education in counter-acting populism (see [Sant and Brown, 2020](#)). Two main alternatives have been put forward: a struggle against anti-rationalism and a battle against economic deprivation.

Education as a struggle against anti-rationalism

Many educational policymakers, academics and practitioners have seen education as a potential cure for populism ([Sant and Brown, 2020](#)). For instance, the former Secretary of Education of Spain, Iñigo Méndez de Vigo argued that Europe faced three challenges: terrorism, populism and nationalism. He further explained, "[t]hese could fracture Europe if we fail to invest in education and the fundamental values of social harmony and democracy" ([La Moncloa, 2017](#)). Tom Boland, former chief of the Higher Education Authority (HEA) in Ireland, also wrote in 2016,

"We need the capacity for critical thought and analysis, and we need academics committed to questioning and testing received wisdom, putting forward new ideas and stating controversial and unpopular opinions, and we need government and the institutions to work constructively, mutually to support our democratic society. Populism contains a special threat to all of that. But 'isms' that would destroy the values, rights and freedoms of Western democracy have been defeated before. Higher education must be at the forefront of the struggle."

[Boland \(2016\)](#).

Underpinning these understandings lie different political and educational assumptions: populists are always anti-pluralist, authoritarian, racist, and they represent a democratic threat. The alignment with populist discourses is irrational (cognitive hypothesis above). Populism is here seen as an individual deficit of those who, lacking critical thinking and knowledge, get obsessed with conspiracies, manipulated by unsincere leaders or let their emotions prevail over their reason ([Mudde, 2010](#)). From this perspective, education is essential. Students should learn critical thinking and critical literacy to counter the anti-rationalist (populist) threat. Literacy and critical literacy skills are often identified as the key to uncover populist rhetoric and communication, so students do not feel attracted by populist discourses (see, e.g., [Heggart and Flowers, 2019](#)).

While this perspective is implicit in many educational accounts of populism, it is not undisputable ([Sant and Brown, 2020](#)). There is first an issue with the cognitive assumption underpinning this perspective. As we have seen above, very highly educated people support populist discourses. Knowledge and literacy skills might explain the alignment with populism to some extent, and in some cases, but it is not a philosopher's stone. Why people vote or vote not for populist alternatives is likely to be a more complex issue.

Further, the binary divide between cognition and emotion that this perspective assumes, with populists leaving their emotions to prevail and non-populists using knowledge and reason, is problematic in many ways. Psychologists [Pons et al. \(2010\)](#) have explained that we do not yet know where cognition begins and emotions finishes, and how they relate to each other. Post-structuralists, post-colonialist and feminists have much evidenced how cognitive hierarchies based on reason/emotion divides historically served to reproduce power relations ([Hoppers, 2001](#)). Mentions to irrationality have often been used to lesser others, being those often women, working-class or colored or colonized peoples. Thus, some might argue that we should be suspicious against any form of education that aims to educate the "irrational".

This perspective also assumes that all populist movements are anti-pluralist, authoritarian and racist. As we have seen above, this is also a matter of debate. Even if we just consider far-right-wing forms of populism, whether or not authoritarian and racist attitudes would be changed through an education focused on knowledge, critical thinking and literacy is questionable. [Waisbord \(2018\)](#) explains,

“Facts never change the unfalsifiable premise of populism—the eternal division of ‘pure people’ and ‘evil elites’. This conception of politics turns into a political fantasy that cannot ever be proven wrong (Müller, 2017). Populism dismisses facts that challenge overriding narratives. No matter what happens, populism obstinately clings to the notion that elites are always in power and continue to distort the truth through their institutions. Populism can never be corrected by its critics. Critics can never offer facts that question, challenge, or complement populist assertions.” (p. 10).

Similar arguments have been made by those conducting empirical research. According to Miller-Idriss and Pilkington (2017), educational interventions that aim to reach far right populations can only succeed by acknowledging the affective dimension. Thus, academic proposals that separate cognition from emotion and only focus on facts and knowledge might not succeed in their purpose.

Finally, it can also be argued that this perspective self-defeats itself in presenting populism as a democratic threat that needs to be counter-acted in the educational arena. As we have explored above, whether or not populism is a democratic threat depends on how we understand democracy. This perspective, is suspected, assumes that populism is a threat to democracy because, in conceptualizing democracy as a liberal democracy, it privileges the rule of law over the rule of the people. The problem here is that this perspective appears to protect the rule of law against the rule of the people itself. We might or might not like who has been elected, but the power of this person/party arises from the people’s will. Some might wonder, is it democratic to attempt to educate people to vote anti-populist options, so previous institutions are secured?

Education as a struggle against economic deprivation

Other policymakers, academics and practitioners understand populism is a consequence of economic deprivation and economic deprivation is a consequence of a lack of education. Here, a different kind of educational failure causes populism. Populists have not been able to keep up to date on the skills and knowledge modern society require. For instance, in an interview, Tony Blair, former UK Prime Minister explicitly discussed the rise of populism and argued the answer was not to “blame migrants” but to “get the education and skills” that could lead to better jobs and opportunities (Coughlan, 2016).

This perspective relies on the status hypothesis outlined above. According to Kriesi (2014), global dynamics of economic and cultural globalizations have fostered the existence of a bank of “losers of globalization” who are particularly appealed by populist discourses. Since the end of the second World War, western societies have transitioned to a post-industrial economy where blue-collar male-dominated jobs have decreased and lost economic value (Cohen, 2019). The 2008 financial crisis accentuated economic inequalities in Western societies, increasing the number of “losers” or workers who, after decades of delocalizations, feel that their knowledge and skills are no longer economically valuable. Sztompka (2016) explains how these “losers” are often “less educated, manual workers but also several branches of more skilled workers whose training and skills have turned obsolete” (2016, p. 82). This has led to emotions of resentment, economic insecurity and politico-socio-economic status anxieties that have been exploited by some populist leaders (Cohen, 2019).

While there is much value on the losers of globalization analysis, this analysis is not exempt from critique (see Sant and Brown, 2020). Empirical research often suggests that support for populism is conditioned by education, age, gender and ethnicity but whether or not economic deprivation is correlated to populism is highly questionable (Inglehart and Norris, 2016). Power relations are multi-faceted; some might not have high educational qualifications and yet have good incomes. Many others in a situation of economic deprivation are migrants themselves who would not “blame migrants”. Further, not all education and skills lead to better jobs and opportunities as shown, for instance, by the highly qualified—but poorly paid -electorate of Spanish *Podemos*.

Further, it can be argued that this perspective also ignores that, in capitalist societies, educational qualifications are positional, not absolute. What matters to get a better job is whether you are better qualified than others, not your qualification overall. Thus, while education is often presented as a consumption good that generate returns for progression in the social ladder, the correlation between education and economic status are often challenged by sociological analysis (e.g., Brown et al., 2010). It does not matter if people are better educated; there will always be those who are “lower” educated than others. We can further educate new generations, but within capitalism, there will always be people who will not gain higher-skilled jobs because they will be others more qualified. If we take this critique into account, providing more education to all might not necessarily address the economic inequalities that trigger some forms of populism.

Should education learn from populism?

Some academics in education have questioned whether populism could be meaningful for educational practice and research. Philosophers and political scientists including Ernesto Laclau, Chantal Mouffe, Yannis Stavrakakis, Aletta Norval, Jason Glynos and David R. Howarth have considered that the study of populism provides insight knowledge on how politics function. Following their example, some educational academics have questioned whether the way populism operates can tell us something about education itself.

Learnings from populism for educational theory

Four different main concepts have been borrowed from political theory examining populism: demands, chains of equivalences, antagonism and empty signifiers.

Demands are requests that people pose to those on power. We always have requests over issues—these demands are not necessarily conscious, but we feel we want or need something, and we ask for it. In many occasions, those on power satisfy these demands. But in many other instances, these demands are not met, which triggers the beginning of political movements. Populism is a consequence of many unsatisfied demands with people feeling that those on power are irresponsible.

Chains of equivalences (also equivalential chain, discursive chain). People have different demands: what I want is not necessarily the same as my neighbor wants. We are different (the logic of difference). However, on some occasions, different demands can articulate each other as they all request something from those on power. My neighbor and I might want different things from our local authority, but we both are unhappy with them (the logic of equivalence), and thus, we create an alliance. Chains of equivalences are alliances across people holding different demands when people or groups provisionally put aside their differences in support the achievement of the broader aim. For instance, Bernie Sanders mobilized several heterogeneous groups, including Occupy Wall Street and Black Lives Matter. While each group had different particular demands, they allied—they create a chain of equivalences—in support of Sanders.

Antagonism. Demands are always posed to someone else, and when this someone else is irresponsible to our demands, we might see them as antagonists. In the case of populism, the antagonist is the elite: ‘the people’ are allied against the elite. My neighbor and I might have very different demands, but we are united against our antagonist local authority. This alliance—against the elite—is strong enough for us to mobilize together. While Occupy Wall Street and Black Lives Matters are very different movements with different demands, they both oppose existing inequalities in American society and those who perpetuated such disparities. Donald Trump, himself owner of a big corporation who holds support from white supremacist movements, represents the antagonist to be defeated.

Empty signifiers are signifiers (words, images, signs, etc.) that can take different meanings. “The people”, of populism, is a clear empty signifier: it means different things to different people. For instance, while Donald Trump often defines the American people as the common American who wants little interference from Washington, Bernie Sanders often describes them as oppressed by economic powers such as those of Wall Street. When different groups compete to give meaning to this signifier, the empty signifier becomes a *floating signifier*. In political discourses (populist or not), “the people” is often a floating signifier.

Learnings from populism for educational practice

Education in the “Mode of Populism” (Mårðh and Tryggvason, 2017) aims to explore how these different conceptual tools can be helpful for pedagogical practice. Education in the “Mode of Populism” does not seek to educate young people to be populist or anti-populists but rather consider how, what we know from populism, might facilitate more democratic educational practices.

In this perspective, Szkudlarek (2011) argues that critical curricula content such as “democracy”, “culture”, “nation”, “science” or “the people” are empty signifiers very often in dispute. Thus, educational practices intentionally or not might be participating in the struggle to define what each of these signifiers mean. Educators could facilitate that young people themselves participate in determining the meaning of these contested ideas (see, e.g., Sant and Hanley, 2018). For instance, teachers could ask, who is “the people”?

It has also been argued that a different approach to political demands can be helpful to mobilize young people. My own work (Sant, 2019b, 2021; Sant et al., 2021) following that of others (Mårðh and Tryggvason, 2017; Ruitenberg, 2009; Zembylas, 2020) has questioned whether educators should facilitate that students can publicly demonstrate their demands and affective investments. Exploring how young people feel about different contradictory issues could foster educational and political engagement and allow students to experience how those perceived as “antagonists” in some political struggles can be allies in others (Sant et al., 2021).

Mårðh and Tryggvason (2017), Snir (2017) and Sant (2021) have also argued that learning from populism might offer opportunities to generate collective identities. After exploring students’ demands, teachers could facilitate that students articulate among themselves and others in equivalence (Snir, 2017). The role of educators here would be to create spaces of discussion where students (and teachers) can raise their demands, solidarize with others, and build new political projects.

Finally, it has also been questioned whether educators could utilize the tools above to interrupt challenging populist discourses. In line with Michael Apple’s (2015) “politics of interruption” (174), educators could attempt to challenge existing political alliances and create new ones so students position themselves against oppressive regimes. Thiel (2019) has argued that higher educators could mobilize a discourse of “the people” presenting themselves in alliance with university students against existing oppressive structures of governance. In my work, I have questioned whether educators could appeal to some egalitarian demands within populist movements (e.g., political and economic equality) to stop young people feeling attracted to extreme right political options (Sant, 2019b).

These proposals, nevertheless, also hold significant challenges. In one extreme, there is the risk of educators perpetuating existing anti-democratic threats by making room for some challenging discourses. What would happen, for instance, if students would antagonistically present themselves against each other or against those who are not in a position of defending themselves? Indeed, as Mårðh and Tryggvason (2017) argue, educational practices need to be assessed in relation to their intentions and their consequences. If in an attempt to make pedagogical practices more democratic, educators do indeed facilitate the spread of extreme-right discourses, this would certainly be counter-productive.

In the other extreme, there is the risk of educators attempting to socialize students on the political options they find preferable. If educators do indeed interrupt existing political alliances and create new partnerships with their students, this might be ethically and legally problematic. Many countries have legislation that stop teachers and other educators from “indoctrinating” children and

young people in a partisan matter. Further, in the same way as above, we could wonder, is it ethically appropriate for a teacher to attempt to educate young people so they support their own political perspective?

Learnings from populism for educational research

Educational researchers have also considered how the tools derived from the study of populism can be used for discourse analysis. The terms demands, chains of equivalence, empty and floating signifiers have been used to explore the complex way in which people understand ideas such as “the nation” (Sant and Hanley, 2018), “the people” (Sant, 2019b), “democratic education” (Sant, 2019a), education for global citizenship (Mannion et al., 2011; Pais and Costa, 2020), “educational assessment” (Thiel, 2019) or “good teaching” (Trent, 2011). When explored as empty signifiers, these concepts can be examined in all their complexity, considering the demands that aim to give meaning to the signifier and how these demands relate to each other in chains of equivalences. The use of empty signifiers can facilitate uncovering how ideas overlap, evolve, contradict and articulate to each other. The drawback of this tool for educational research, is its highly situated nature. In the same way it is challenging to generalize anything related to populism. Any findings derived from educational research on empty signifiers are very likely to be context-dependent and ungeneralizable to other times and places.

The conceptual tool of “antagonism” has also been used for educational research. For instance, in my work, I have explored whether university students conceptualize “global citizenship” in all-encompassing or on antagonistic terms (Sant, 2018). Others have also used the tool of antagonism to examine how religious education is understood in teacher education practices (Carlsson, 2020) or how UK university students and lectures position themselves in relation to others (Lapping, 2005; Thiel, 2019). This conceptual tool also has its drawbacks. Similarly as above, the use of antagonism as a tool for discourse analysis is context-dependent, and researchers cannot assume that antagonistic relations found exist elsewhere or will always exist. Also, it can be argued that the use of antagonism as a conceptual tool presupposes a binary understanding of societies that, while implicit in Western cultures, does not exist elsewhere (see, e.g., Sant, 2018, 2021). Thus, educational researchers might need to be careful to not imposing a “binary tool” that might tell more about their assumptions than about the data they are indeed examining.

Conclusions

Populism is not an easy concept. Academic theory and research on populism offer a far more nuanced image of populism than the one we sometimes encounter in the press or everyday speech. What populism is and whether or not populism is bad for democracy is a matter of debate. The same can be said for education. Populism cannot be easily used to justify why educational interventions are needed. Whether or not populism is caused or can be corrected via education is questionable. Further, whether it should indeed be “corrected”—via education or any other social intervention—is a question that demands ethical consideration. Simultaneously, the study of populism has offered educators some possibilities to consider for educational theory, practice and research. However, as populism itself, these possibilities are not straightforward: they demand contextualization and careful ethical debate.

The China challenge

As with several other Asian systems, China's education system has ancient roots and modern branches. Its rich legacy of past traditions haunts its present, as it strives to strengthen education, reduce inequalities, develop world class universities, and challenge the best of the West. At the same time, while spectacular progress has been made in both quantitative and qualitative terms, it confronts several key challenges that arguably inhibit its further development.

Genesis and development

While the emphasis in what follows is on the modern system of education, it is not possible to understand key contemporary developments without seeing these in a longer historical perspective. China's rich history of ideas, embracing intersecting frameworks such as Buddhism, Daoism, and Confucianism, and major figures such as Lao Tze (老子) [571-501? BCE], Confucius (孔夫子) [551-479 BCE], and Mencius [372-289 BCE] (孟子), helped forge what can be called the Chinese model of education. First developed several centuries BCE, during the Zhou dynasty, it was finally formalized during the Tang dynasty (618–907). Centered on a Confucian worldview, it stressed self-cultivation at the individual level, and active ethical engagement and governance at the societal level, encapsulated in the idiom “sageliness within and kingliness without” (*nei sheng wai wang*, 内圣外王) (Zha, 2022; see also Yang, 2020). The model, based on Confucian ethics and a curriculum based on the *Four Books* and *Five Classics*, was widely influential in East Asia, including Japan (briefly), Korea, as well as Southeast Asia's Singapore, and Việt Nam where Confucius was celebrated as the teacher of a thousand sovereigns. Persisting in the region until the early 20th century, elements survived the *anti-Confucius* campaign of the 1970s, while, more recently, elements of Confucian thought have again been pressed into service in education. The Confucian tradition in education continues to exert a powerful influence on the contemporary world of Chinese education governance (Yang, 2020).

China's institutional legacy is just as strong, beginning with the first Asian institution of higher learning, the *Jixia Academy*, established in 360 BCE, during the Warring States period of what is now China. Its teachers included Mencius (孟子), Hsun Tzu (孫子) [c. 310-220 BCE], Zou Yan (鄒衍) [305-240 BCE] and Shen Dao (慎到) [350-275 BCE]. The *keju*, or imperial examination system was another important innovation, that opened the door to official positions, to students who survived the rigorous, formal set of written examinations. The examinations were conducted at three levels—district, province and national—and quite a number fell at the first hurdle. The highest degree, known as *Jinshi* (進士) was required for the highest office, whereas the basic degree of the *Shengyuan* (生員) was insufficient to secure a post, because it was so oversupplied. The Confucian institutional model, including the core principle regarding the value of knowledge and self-cultivation, became an important base of regional higher education (Hayhoe, 2013). Versions of the system spread to parts of both East and Southeast Asia (Welch, 2019). Residues remain in Singapore (Tan, 2012). The *Taixue* (太学) sometimes called the Imperial Academy, was founded in the Han dynasty (206 BCE-220 AD), when it had as many as 30,000 students and teachers. Renamed the *Guozijian* (國子) during the Sui dynasty, it was considered the pinnacle of educational establishments. Based on a curriculum of Confucianism and Chinese literature, it supplied well educated, senior administrators for the imperial government, and endured until 1905.

Two further problems weakened the system. Wealthy merchant families could educate their sons, thereby gaining preferment at the expense of poorer families. Secondly, corruption ensured that in some cases it was also possible to purchase degrees. Becoming even more formal and increasingly orthodox during the Ming dynasty (1368–1644), the model survived until the end of the sclerotic Qing dynasty at the beginning of the 20th century. By then, however, the system was being openly criticized. On the one hand, the formal knowledge taught was narrow and exclusive: its traditional curriculum ossified, and eschewed the study of modern subjects such as science, technology and mathematics that in the West were seen as a key pillar of modernity. In China, the civil service examination system that persisted until 1905 was increasingly seen as stifling national scientific and technological advancement, and at least in part responsible for China's humiliating failure to resist Western imperialist incursions and plunder in the 19th century (Ironically, however, the modern Chinese schooling system of the time, established before the May Fourth movement, was in large part based on emulating the foreign systems, notably German and Japanese). On the other hand, it was also inefficient: some 2 or 3 million applicants sat the exams each year, with a failure rate of around 99%.

A second, less well-known institutional innovation was seen by some as “the highest institution of learning” (Ding, 1996, 231). It had greater, if fragile, autonomy, than the *Keju*, according to Hayhoe. Originating during the Tang dynasty, the *Shuyuan*, (书院) or academy, was a non-state institution of learning, comprising a community of scholars and teachers focused on self-study and research. *Shuyuan* were often sited in quiet rural settings, to avoid worldly distractions. Famous examples included the Bailudong (White Deer Grotto), Yuelu, and Taishi Academies, versions of which spread to Korea where they were known as *Seowon*. They endured until the dying days of the Qing dynasty, in 1898, and influenced 20th century reformers such as Cai, Yuanpei and Hu Shi, as well as Mao Ze Dong (Ding, 1996).

For the masses, village schools of varying quality were not uncommon. Poorer communities struggled to sustain such institutions. Poorer families were also less likely to educate their daughters than sons, based on the Chinese convention which, upon marriage, transferred a daughter to the control of the husband's family. Hence, to educate a daughter was tantamount to “weeding the field of another man.” Rote learning was ubiquitous, based on texts such as the *Sanji Jing* (Three Character Classic), followed by the *Qianzi Wen* (Thousand Character Classic).

Science and innovation

Chinese science and discovery also flourished, including the four great inventions—papermaking, printing, gunpowder, and the compass—that represent major contributions to world civilization. These inventions were only a part of China's rich array of scientific and technological inventions, however (USC, n.d.). It is no surprise that *Zhongguo* (the Middle Kingdom) saw itself as the center of the world, with, at various times, little interest in the world outside (Kwong, 2015). Ancient maps tended to portray China at the center, with other categories radiating outwards toward the outermost “barbarians.” (Jacques, 2012)

But by the onset of what is broadly known in the West as the Scientific Revolution, from around the 16th century, the flowering of Chinese inventiveness had largely waned. Its education system, too, which had been formalized in the Tang dynasty, had begun to ossify, at much the same time as China began to need to negotiate the crossroads of modernity (Kwong, 2015).

Western incursions

The final decades of the Qing dynasty (1642–1911) included a longstanding debate about the value of Western knowledge, that, while evident as early as the long stay of foreigners such as Matteo Ricci (1552–1610), continues in some form to this day. To some extent, it hinged around different stances regarding the Chinese aphorism *Zhōngxué Wéi Tǐ, Xīxué Wéi Yòng* (中学为 体, 西学为用) that can be broadly translated as Chinese learning for fundamental principles; Western learning for practical application.

The forced opening (and plundering) of China by Western imperial powers from the time of the Opium Wars of the 1840s, not only convinced many in China that the traditional form of education, among other elements of Chinese society, was no longer adequate. It also led to new institutional forms, since part of the nearly 200 unequal treaties imposed on China at the time included freedom for Western missions. Prior to the Opium Wars, foreigners were banned from missionary activities. The American magazine *Puck* satirized the missionary zeal in a pointed cartoon of 1895. Showing the interchange of missionaries and Chinese authorities as occurring under the looming cannons of Western military forces, its caption read “According to the ideas of our missionary maniacs, the Chinaman must be converted, even if it takes the whole military and naval forces of the two greatest nations of the world to do it” (cited Welch, 2014b).

In blissful ignorance of centuries of Catholic activity in China, Protestant missionary schools were established, with the enthusiastic support of networks in the US, who supplied staff, money, and Chinese-language publications (sometimes in local dialects, rather than imperial Mandarin). Beyond their particular missionary remit, they had wider educational aims: to translate foreign texts, help introduce new ideas in mathematics, science, and engineering, and develop institutional innovations such as schools for the blind and industrial schools. Just thirteen American colleges were established, (although their influence was broader than their mere number), while an 1877 report listed 30 boys' and 38 girls' boarding schools, enrolling around 600 boys, and approximately 800 girls (totaling 1400 pupils in a population of 400 million). In addition, there were 82 girls' day schools and 177 boys' day-schools (Welch, 2014b: 11, citing Du Bose, 1879). The British Church Missionary Society in Fujian Province founded over a hundred village day schools (Welch, 2014b: 22) While for missionaries, the prime purpose was evangelism, local pupils often saw it differently. Those who learned English could often make money by interpreting, or engaging in trade with foreigners

(sometimes pilloried as 鬼佬 *Gweilao*, or foreign devils). Chinese families, too, saw such schooling as a means of personal and familial advancement. The missionaries' evangelical aspiration remained largely unfulfilled.

The end of the 19th century also saw the establishment of the country's first Western style universities. Tianjin University (天津大学) (formerly Peiyang University) (1895) and Peking University (北京大学) (1898) were prominent early examples (Hayhoe, 1996). Each has already celebrated their 120th anniversary. Each also revealed foreign influences in their early development. At Peking University, Cai Yuanpei's experience of both the German and French models of higher education led him to introduce forms of faculty governance, democratic management, and principles of freedom of thought. Tianjin university was more influenced by US higher education, via the work of the educator and diplomat Charles D. Tenney, Peiyang's first President. Its early graduates could enroll directly into either Harvard or Yale.

An enduring legacy: from Republic to People's Republic

While the rigid formal mode of education that was associated with the old imperial system fell into abeyance, it nonetheless left an enduring legacy of respect for learning and scholars, as even Western educators still acknowledged in the early 20th century: "Study in China is considered a vocation, the maxim being common among the people that 'Study is the highest pursuit a man can follow'" (cited Welch, 2014a: 25).

Inspired by democratic principles, Republican China (1912–1949) saw some significant initiatives introduced. This included reforms to schooling, the practice of which was seen as productive of a modernizing democratic polity. Not all reforms, however, came to fruition. The ambitious School Reform Decree of 1922, for example, came up against a society that was "intensely undemocratic to begin with" (Keenan, 1974: 225).

Western educational influences during the Nationalist government were repudiated after the victory of Communist forces, and proclamation of the Peoples Republic of China (PRC) in 1949. Gu usefully divides education in the PRC into three stages, with distinct emphases: Learning from the USSR (1949–1958); Leftist education (1958–1978); and Reform and Opening (1978–) The second stage, he argues, should be further sub-divided into three periods: 1958–1966, comprising the education revolution, 3-year adjustment and class struggle; 1966–1976, resulting in the educational ravages of the Cultural Revolution; and 1976 to 1978, called "bringing order out of chaos" (Gu, 2015: 195; Welch, 2019).

The early years of the People's Republic, from 1949, marked major changes in education, not least through a stress on public education. Many private schools and universities were simply closed or transformed into public institutions, a major shift given that private higher education institutions (HEIs), for example, had comprised 39% of overall enrollments. Nankai and Xiamen universities were prominent examples of transformation into public HEIs, a process which had been completed by 1956. The scale of the national challenge was illustrated by a 1951 conference devoted to Engineering education, that identified the following major issues:

- imbalanced geographical distribution;
- dispersion of teachers and facilities leading to uneconomic practices;
- impractical specialties that failed to train specialized personnel;
- and a shortage of students (Yang, 2000: 321).

Given the huge scale of needed reforms, and the background of widespread illiteracy, the Cold War era, ravages inflicted by the Nationalist-Communist Civil War, and China's lack of much international support, it was no surprise that the first few years (from 1949) were characterized by the dependence on institutional models, translated textbooks, forms of pedagogy, and some teachers and "advisors," from the much-more-established Union of Soviet Socialist Republics (USSR). In China this era was sometimes characterized as "Learn from Big Brother." Russian replaced English as the major foreign language, "spare-time" schools and other special schools were instituted for peasants and workers, including their families, and higher education was reorganized on Soviet lines. International scholarly networks, too, were bounded by the USSR and its eastern-European satellites:

study abroad—unless undertaken in the then Soviet Union or Eastern Europe—was generally regarded as politically and culturally suspicious. Those who had studied in the West ... were denounced as "running dogs" of imperialism and traitors.

Rhoads (2011: 6).

The major ideological break with the USSR from the mid-late 1950s presaged major changes, however, including in education. This included a much more discriminating attitude toward Soviet educational theory and practice, adopting only what was found to be useful in the Chinese context. Open criticisms of Soviet errors by some Chinese students in the then Union of Soviet Socialist Republics (USSR) led to some being expelled in 1963 for spreading ideologically incorrect views (You, n.d.) More broadly, an emphasis on ideology grew in education. Workers and peasants were admitted to spare time schools based on their political orthodoxy, rather than formal qualifications.

The emphasis on ideology only intensified during the Cultural Revolution (1966–76). Education reform was seen as a catalyst for cultural revolution and class struggle (Pepper, 1996: 352 et seq.). Educators and intellectuals were sent down to the countryside,

to learn from peasants. Many endured years of painful privation; some died or committed suicide (Ai, 2021; Welch, 2019). Universities were closed, and a generation lost the opportunity for further study. Not until 1976 did universities open again, and by then it was too late for many. Not for nothing did Gu characterize the immediate aftermath of the Cultural Revolution as “bringing order out of chaos” (Gu, 2015: 195).

China's challenges

China's rich history of respect for learning, together with influential pedagogical and institutional models created a sound educational basis, enduring for millennia and emulated regionally. Even after institutions such as the *Shuyuan* and the imperial examination system were abandoned at the end of the Qing dynasty, a legacy of respect for learning and education persists broadly, including among the worldwide Chinese diaspora, where students of Chinese background often outperform locals (Mullis et al., 2008; Zhao and Singh, 2011). International achievement tests, such as the OECD's Program of International Student Achievement (PISA) further confirm high levels of achievement among the Chinese student cohort (OECD, 2018). Chinese teachers of mathematics are now sought internationally, and leading Chinese universities now take their place among the world's best (Yuan and Huang, 2019; ARWU, 2021). China is now the world's largest source of research publications, its leading scientists now routinely figure among the world's highly cited scholars, and it has now become a major knowledge partner of a range of countries, both within its region and more broadly (SupChina, 2022; Cheng, 2021; Welch, 2014c, 2021b). It was also (pre-COVID) one of the world's leading destinations for international students, with 500,000 enrollments, and its large and diverse worldwide knowledge diaspora is making substantial contributions to research, both in China and many other parts of the world (Yang and Welch, 2010; Welch and Hao, 2016). China's universities, particularly those in its border regions, have forged important relations with ASEAN neighbors, and China has been generous with scholarships both ASEAN scholars, and to the developing world, to study at its universities (Wen and Hu, 2016; Welch, 2014c, 2018).

Together these achievements make for a remarkably impressive achievement. And China's restless ambition seeks to achieve more, including goals to move to an innovation-based knowledge society, with world-leading universities and research. At the same time, however, the country confronts a range of challenges that impinge on these lofty ambitions.

Reform and opening era

The decade long Cultural Revolution had laid waste to China's education system. The Third Plenary Session of the Eleventh Central Committee of the CPC (1978) faced the urgent challenge of reconstructing and improving education. The Cultural revolution's legacy was catastrophic: a shortage of teachers, as well as the destruction of institutions and scholarly resources of all kinds. Regulations governing educational institutions were revised and re-established, and order restored. Restoring the national tertiary education entrance exam (*Gaokao*) symbolized restoration and reconstruction. Educational funding was set to rise, as were education costs borne by families—the latter gradually. Some decentralization was introduced, and the doctrine of principal accountability (*Xiaozhang Fuzezhi* 校长负责制) introduced. More emphasis was given to market principles from the 1990s, with the aim of developing a socialist market economy with Chinese characteristics.

Paralleling China's monumental economic achievements, that saw its economy grow by an average of 10% in the decades following 1978, educational achievements were also impressive. From the 1980s, adult literacy rates rose from 65% to the current 96%. Over the same period, the university participation rate by high school graduates rose from 20% to closer to 60%.

But such success led to other difficulties. China now produces more than 11 million university graduates annually, who struggle for advantage within China's highly competitive job market. Graduate unemployment and underemployment has become a significant issue, especially for those from second tier, and regional universities. Such students fare less well, and Lian Si's so-called “Ant Tribe” (*Zhuyin Fuhao*, or 蚁族) phenomenon entered popular discourse from 2009. It described a situation where, facing unemployment or low wage and part-time employment, impoverished and either unemployed or underemployed students, often from rural or second-tier universities, crowded together in meager living spaces in China's major cities. “They share every similarity with ants. They live in colonies in cramped areas. They're intelligent and hardworking, yet anonymous and underpaid” (China Daily, 2010).

Rural-urban differences

Forms of inequality in education begin much earlier, with rural children often taught by less qualified teachers, and facing less well-equipped schools. Their chances of gaining access to one of China's forty or so elite 985—now known as Double First Class or *shuangyiliu* (双一流)—universities (mostly located in China's major cities) are much lower than children who have grown up in such cities and attended a well-equipped and well-staffed school. Rural-urban inequalities have tended to widen over recent decades, despite efforts to reduce the difference. According to one survey, relatively high dropout rates from primary and Junior High Schools meant that a mere 6% of rural children entered Senior High Schools, only half of whom graduated. Two percent obtained access to tertiary education. For urban students, the respective rates were 63%, 63% and 54% (Zhang et al., 2015: 200).

Some forms of decentralization were introduced into education, but this too, had some problematic outcomes. In practice, decentralized operation and management (*Fenji Banxue Fenji Guanli* 分级办学 分级管理) meant that funding compulsory schooling

became the responsibility of township-level governments, thus widening the gap between richer and poorer communities, and rural and urban settings.

Private education

After pilot programs in 1993, some private (*minban*) schools were introduced in 1994, although in accordance with socialist ideology the term “civilian run and public subsidized (*minban gongzhu* 民办公助)” was preferred to “private.” There are in addition hundreds of *duli xueyan* (privately run, “second-tier” colleges, only able to offer degrees via their major “mother” public university). In practice, these commonly comprise a partnership between a major public HEI and a private entrepreneur, for whom developing and selling housing around the HEI was likely to be much more lucrative than income from student fees. Tensions developed between public HEI partners more interested in quality, and private entrepreneurs more interested in profits. Examples of corruption touched recruitment, fees and financial administration (UWN, 2014; Welch, 2020). Private enrollment at the tertiary level now accounts for around 13.5% of the total (5,871,139 of a total enrollment of 43,367,394 (PROPHE, 2020: 12; Welch, 2021a), but concerns regarding the quality of *minban* reflect widespread community understanding that this is second-choice higher education. Although fees can be quite high, no such institution comes close to achieving the status or achievements of China’s major public universities, and concerns have been voiced about the impact of privatization: “privatization favors only the elite and wealthy families who are privileged to start with because of their social status and financial capability” (Zha, 2006: 63).

Migrant children

A further form of differentiation is seen in the schooling afforded to migrant children. Wholesale migration of migrant laborers from rural areas to China’s major cities in Eastern provinces (164 million rural workers migrated to China’s cities between 1990 and 2010), led to a growing pool of “left behind” children (*liúshǒu’értóng* or 留守儿童), numbering around 69 million (mainly situated in China’s South and Central regions). This is despite major nationwide poverty reduction measures. Gradual amelioration of some of the more restrictive elements of the household registration (*hukou* 户口) system, particularly after the 1996 *Measures for the Education of School-age Children and Adolescents among the Urban Migrant Population (Trial)* allowed more migrant children with rural *hukou*, who had accompanied their migrant laborer parents into China’s big cities, to gain access to schooling. Different cities adopted varying strategies, some relying more on public schools, while others relied more on the private sector. While 9 years of schooling is free and mandatory, some research shows that 36 million migrant children still do not have access to public schools, while the quality of informal schools that sprang up to cater to migrant children in China’s major cities is variable, and not always well regulated (Liu, 2019).

Guanxi

Guanxi (关系) describes the network of social relations that largely govern Chinese lives. Not entirely dissimilar to the Western concept of social capital, it encompasses the mutually beneficial system of trusted relationships that are depended on by individuals to live by and advance one’s career or interests. Effectively, personal bonds must first be established before an effective reciprocal relationship can be inaugurated. To some extent, such relations are grounded in Confucian assumptions about familial and hierarchical social relations, reciprocity and trust and the concept of face (*面子*, *miànzi*). While *guanxi* was set originally within a set of ethical principles, its form is at times abused to operate in unethical ways. It can be used to extract social or economic advantage in social, political or business environments, such that interpersonal obligations take precedence over civic duties. In education, it has been associated with non-merit-based awards of research grants, and promotions, for example (Welch, 2020). In education, for example, “... if someone has a good *guanxi* with the official in charge, the official could interpret the rules in the way that is favorable for that person” (Guan, 2010: 2). This can lead to exploitation of younger staff, often female. And in relation to research, it “encourages researchers not to devote their time on research but on schmoozing with those in power. In some cases, bribery and corruption also take place” (Qiu, 2014: 162).

Corruption

Corruption exists in most societies, to greater or lesser degree. But, like numerous other Asian nations, China does not score well on measures of corruption, defined by Transparency International (TI), as the abuse of entrusted power for private gain, either material or personal. In education, this embraces such practices as appointments or promotions gained through nepotism or cronyism, paying a bribe to secure a place in a private university, or an individual pocketing funds to which they were not entitled. In higher education, for example, it includes the issuing of fraudulent certificates (for payment); inflated or illegitimate procurement contracts, (for new university infrastructure, or building maintenance); accepting or paying bribes or exploiting students for sex in return for entry into university, passing a course, or granting a degree; offering or accepting payments for higher grades; levying private payments for additional tuition, without which the student is unable to pass the exam; claiming fake qualifications; engaging in cronyism/nepotism; pursuing plagiarism; falsifying research results; passing off student research as that of the professor, misusing research funds; or paying bribes to secure academic posts, get promotion, or gain program or institutional accreditation

(Welch, 2020). Such forms of academic corruption all occur in China; they weaken higher education and erode trust, both in the institutions in which they occur, and more broadly in society.

US-China tensions

Increasingly rivalrous and rancorous US-China relations in recent years, arose from the so-called Trade War, that soon came to be increasingly acknowledged as a Technology War, Culture War, and even a Cold War. The impact on education was seen starkly in moves toward de-coupling of international research networks, and restrictions on international staff and student mobility. Collectively, these curtailments were said to erode national and international innovation. Motivated by techno-nationalism, and a fear that China might out-innovate the US, America moved to deny visas to 3000–4000 Chinese researchers and post-graduates in key high-technology areas (robotics, new materials, artificial intelligence, quantum information, neuroscience), revoked the visas of a further 1000 researchers and students, and prosecuted ten Chinese-American scientists (Zhu, 2021).

Pressure by the US on its allies to align themselves led to increasing pressure on bi-lateral research collaboration with China, the securitization of related policy arenas, rising *anti-Chinese* sentiments and attacks, and heightened nervousness and concern among thousands of Chinese researchers in a range of countries, who feared they were being singled out (Raby, 2020; Brophy, 2021; Welch, 2021b). Japan, Germany, Canada and Australia each introduced a range of measures to audit and curtail China research relations. The passage of the bi-partisan *US Competition and Innovation Act*, by the US Senate in mid 2021 directly aimed to counter China's technological rise. This was compounded by a White House decision to increase the number of Chinese firms subject to a black ban on US investment, that in turn, followed earlier actions to ban or restrict Chinese investment in US technology firms and encourage US firms to move production of key tech components out of China (Evans, 2020; Franck, 2021a,b). Staff and student mobility were further reduced by a range of travel restrictions introduced by China and many other countries from 2020 in response to the COVID pandemic. In a number of Chinese universities, international student enrollments fell to a small fraction of pre-COVID numbers.

Philosophical-practical contradictions

To some extent, contemporary contradictions in Chinese education can be said to stem from tensions between two co-existing traditions, each of which is deeply rooted in Chinese history: "the Confucian core notion of eternal self-perfection and spiritual freedom, and a politicized and instrumental Chinese higher education in reality" (Zha, 2022, see also Yang, 2020). These tensions were sharpened after 2012, through the increasing re-assertion of the Communist Party of China's (CPC's) leading role, including in many facets of education. In a series of guidelines, such as "Opinions concerning Further Strengthening and Improving Propaganda and Ideology Work in Higher Education Under New Circumstances" (2015), educational institutions were instructed to hew more to the party line and eschew Western ideas and textbooks. Additional measures were successively instituted to enhance ideological commitment (such as regular meetings on ideology, especially "Xi Jinping thought," for which teachers and academics needed to submit regular "reports," and enhanced tests of political orthodoxy introduced into appointments and promotions procedures). While the technological and natural sciences were less affected, the impact on the social sciences and humanities was greater. According to one analyst, the challenge is to "to uproot Chinese academia from a culturally nepotistic and administrative society, where academic ethics and quality can yield to non-academic factors and the power of 'circles'" (Xu, 2021; 487).

But the moves to re-assert Party leadership were somewhat at odds with performance pressures to publish more internationally, especially in leading English language journals. Such demands were at their most intense at leading Chinese universities where young staff, often returnees with their Ph.D. from a leading western university, were expected to produce a minimum number of such articles, in order to maintain their position and promotion momentum. Older staff, usually male, who had worked all their lives in the Chinese system and had limited English language facility, were exempt, (but would likely be replaced by younger, bilingual staff upon retirement (Welch, 2021c).

In a sense, such pressures represented a new form of the age-old dilemma *Zhōngxué Wéi Tǐ, Xīxué Wéi Yòng* (中学为体, 西学为用). As the Beirut-based sociologist Sari Hanafi explains, the old maxim of Publish or Perish now exists in a new form, especially for academics working in non-English systems: Publish Globally and Perish Locally; or Publish Locally and Perish Globally. In practice, younger Chinese scholars are under pressure to do both. On the one hand international publications are needed, both to gain promotion internally as well as to establish their international profile. But as one young female at a double first class (*shangliyi* 双一流) university pointed out, "If I only publish in English, no-one in China would know who I am" (Welch, 2021c: 378). The intellectual leaders in her field—largely older male academics—mostly published only in Chinese and would not know of her international publications. In effect, she needed to respond to the dual pressures of producing publications in leading international journals, as well as major domestic journals in Chinese. Some Chinese scholars have expressed concerns over the potential for "self-colonization" (Dang, 2005: 68, cited Xu et al., 2021)—due to the over-emphasis on international publications, Chinese HSS (Humanities and Social Science) academics may "accept Western concepts and theoretical frameworks without critical scrutiny and creative thinking" (Deng, 2010: 182), and focus more on Western issues or selectively on Chinese issues of interest to Western countries (Zhu, 2009, cited Xu et al., 2021: 471). In a response to such bias toward Western publications, three major universities, Renmin, Nanjing and Lanzhou withdrew participation in international rankings in 2022, after a speech by President Xi at Renmin, that argued that China must "blaze a new path to developing world-class universities based on Chinese conditions and with Chinese characteristics" (UWN, 2022).

China's current dramatic rise in education and research merits the term renaissance, given the importance of its original model of education. Its quantitative and qualitative achievements are nothing short of extraordinary. It remains to be seen whether further progress ensues at the same pace, or whether ideology limits such development, as it has done on occasion before. A synthesis of Eastern and Western ideas and institutions, incorporating the best of the Chinese tradition, holds great promise for the world, however elusive thus far.

Introduction

Southeast Asia has long been one of China's priorities for regional cooperation. Many analysts have pointed out that the strengthened economic ties contribute most to China's recent growing influence in Southeast Asia. China has continued to be ASEAN's largest trading partner for 12 years in a row. In turn, the Association of Southeast Asian Nations (ASEAN) countries became China's biggest trading partner for the first time in 2020 (China SCIO, 2021). Since the introduction of the Belt and Road Initiative (BRI), China's presence in Southeast Asia has been increasingly featured by a growing focus on further and strategic promotion of its economic, diplomatic, social and cultural connections with countries along the Maritime Silk Road in this region.

Compared with the heated discussions on China's recent economic power enhancement, China's diplomatic efforts in Southeast Asia in and through higher education remain very little documented. Among different levels of education, higher education is most influential in terms of its potential role as a carrier of cultural and political values. China's higher education diplomacy is thus an integrated and significant part of its soft power projection. When used tactfully, approaches to higher education engagement can effectively shape positive perceptions among international audiences, facilitate public diplomacy through transmission of the cultures and values of the host country, and exert influence on future elites of other nations (Yang, 2007).

China engages comprehensively with Southeast Asia in various dimensions of social and economic development. Despite that higher education is an integral part of the broader engagement, the literature on the relations between China and Southeast Asia in higher education is still much lacking. To address the gap, this chapter focuses on some major aspects of the comprehensive and complex relations including international students, language training, development aid, and partnerships in institutions and/or programs.

China as a host to Southeast Asian students

The number of ASEAN students enrolled in Chinese universities has skyrocketed during the past twenty years (See Fig. 1). In 2000, the number of the students from ASEAN countries totaled 5391, constituting 10.34% of the total international enrollments.¹ Since the BRI was launch in 2015, the enrollment of ASEAN students in Chinese universities has been undergoing a huge surge and reached 98,823 in 2018, accounting for 20.08% of the total foreign students.²

Apart from the consecutive growth, the group of Southeast Asian students also exhibits other characteristics. Firstly, a substantial number of Southeast Asian students tend to choose vocational tertiary education. In 2013, a total of 1337 ASEAN students studied in vocational tertiary institutions in China, accounting for 55.7% of all international enrollments in China's vocational tertiary institutions (Wen, 2016). Furthermore, until 2021 five annual China-ASEAN Vocational Education Exhibitions and Forums (MOE, 2021) have been co-organized by the Guangxi provincial government and MOE, and over 350 higher institutions participated in the discussions (MOE, 2018).

Secondly, non-degree and self-funded program enrollments have constituted a considerable proportion of the whole ASEAN student group. A substantial portion of Southeast Asian students have been enrolled in short-term exchange programs in Chinese universities. Since China has been forging tight economic ties with Southeast Asia, more self-funded international students consider a degree earned in Chinese universities or non-degree study experience in China as a stepping-stone to better job prospects at their

²Authors' own calculation based on the data retrieved from Department of International Cooperation and Exchanges of Ministry of Education of China (2018).

Fig. 1 The number of Southeast Asian students in Chinese universities (2000–2018). Authors' own design based on the data retrieved from *Statistics Book of International Students Studying in China* Department of International Cooperation and Exchanges of Ministry of Education of China (2000–2018).

home countries (Tan, 2018). As Fig. 1 shows, the pace of growth of total Southeast Asian students has always been higher than the increase of scholarship holders from ASEAN countries.

Meanwhile, it is noteworthy that an increasing number of Southeast Asian degree students tend to prefer STEM higher education programs because of the latest outstanding performances of Chinese universities in global rankings of academic subjects. Times Higher Education World University Rankings 2021 by Subject put Peking University in 9th in engineering, surpassing the National University of Singapore, the Imperial College London, and Yale University. Tsinghua University ranked 10th in QS World University Rankings by Subject 2017–2019: Engineering and Technology. It moved up to 9th in 2020, beyond Harvard University, California Institute of Technology, and the University of Tokyo.

In general, the proportion of international students in China in science and engineering programs increased from 8.55% in 2008 to 16.69% in 2018 while the proportion of international students in Chinese language programs decreased from 55.74% to 37.68%.³ This is a new development from the previous situation that international students in China concentrated extremely on Chinese language programs (Kuroda, 2014). The results of the latest survey by Obed et al. (2020), based on 1450 current international enrollments, also corroborate such an argument. They report that African and Asian students in China have patronized STEM majors, with Engineering topping the list, whereas more American and European students in China have flowed into social science disciplines.

Due to geographical proximity, southwestern provinces in China have been accredited as the “bridgehead” in China's foreign policy toward Southeast Asia, contributing to a sustaining increase of ASEAN students in the region. In 2017, 14,500 international students had been studying in Guangxi. Among them no less than 65% were from ASEAN countries. The size was tripled within the past decade (MOE, 2018). Lower living expenses are another influencing factor that Guangxi and Yunnan, as less-developed parts of China, have attracted a large number of Southeast Asian students (Yang, 2012).

It seems that diplomatic events have been closely associated with China's initiatives for improving student mobility with ASEAN countries. In 2004, China and ASEAN announced their first *Plan of Action to Implement the Joint Declaration on ASEAN-China Strategic Partnership for Peace and Prosperity* for the period 2005–2010. This plan firstly contained guidance of educational exchange and cooperation. Meanwhile, China promised to provide additional long-term and short-term scholarships to ASEAN countries, especially to

³Authors' own calculation based on the data retrieved from Department of International Cooperation and Exchanges of Ministry of Education of China (2008, 2018).

those that were underdeveloped (ASEAN-China, 2004). From then on, the number of international students from Southeast Asian countries began to demonstrate a modest growth.

On the 15th Anniversary of the China-ASEAN dialog relations in 2006, the *Joint Statement of China-ASEAN Commemorative Summit* was declared. In terms of socio-cultural cooperation, China launched a prestigious China-ASEAN Scholarship (ASEAN-China, 2006). Guiyang Declaration was announced at the First China-ASEAN Education Ministers Roundtable in 2010, agreeing to faithfully implement the “Double 100,000 Plan” to bring the number of Chinese and ASEAN students in each other’s universities to 100,000 respectively by 2020. China would offer 10,000 China-ASEAN Scholarships to Southeast Asian countries per year (Xinhua News, 2011). Next year, Guangxi allocated 15 million RMB as annual funding for Guangxi Government Scholarship for ASEAN Students (China News, 2013). Since then, the number of ASEAN students studying in China has experienced an accelerated increase.

China’s scholarships for Southeast Asian students were also frequently packaged in the speeches delivered by Chinese leaders at key diplomatic occasions. Premier of the State Council Li Keqiang’s address on the 16th China-ASEAN (10 + 1) Leaders’ Meeting promised that China would offer 15,000 Chinese Government Scholarships to ASEAN countries during the next three to five years. Later in 2016, his address at the first Lancang-Mekong Cooperation⁴ (LMC) Leaders’ Meeting proposed to offer 18,000 person-year scholarships and 5000 training opportunities to Mekong countries in the next three years (Li, 2016).

Particularly, with the unveiling of the BRI, new scholarships at national, provincial, city, university, enterprise levels have been set up to attract students from countries along the Belt and the Road. The representative national one is the Chinese Government Scholarship-Silk Road Program, which offers 10,000 annual scholarships to international students from countries along the Belt and the Road, including all ASEAN countries. It turns out that the number of scholarship holders from Southeast Asia rose to 10,115 in 2018, tripled the number in 2010 before the commencement of “Double 100,000 Plan” (See Fig. 1).

Confucius Institutes in Southeast Asia

As China is forging tight economic, cultural and political connections with Southeast Asia, there is an increasing need for people with sufficient Chinese language proficiency and knowledge about Chinese society. Confucius Institutes (CI) and Confucius Classrooms have thus become effective platforms to cultivate “zhihua youhua” (with knowledge about China and a positive impression of China) graduates who are also motivated by better job prospects. Since the first CI established in 2004, 548 CIs and 1193 Confucius Classrooms have been fast established in 146 countries and regions by 2018 (Chen, 2020). By 2020, 39 CIs and 34 Confucius Classrooms scatter in ten Southeast Asian countries as indicated in Fig. 2 below.

The development of CIs in Southeast Asia demonstrates similar features with the CIs in other regions but also follows their own trajectory. Different from other language training institutes such as the British Council, CIs operate in a unique way by pairing leading universities in the host countries with the Chinese domestic ones. Moreover, Hanban, a government unit mainly managed by MOE, was responsible for offering startup funding, allocating of teaching staffs and materials, and coordinating the two sides (Hartig, 2012).

Fig. 2 Number of CIs and confucius classroom in Southeast Asia. Authors’ own design based on data retrieved from Chen (2020).

⁴Lancang-Mekong Cooperation refers to the new sub-regional cooperation mechanism initiated by China, Myanmar, Laos, Thailand, Cambodia, and Vietnam to focus on political and security issues, economic and sustainable development, and social, cultural and people-to-people exchanges of Lancang-Mekong countries via concrete and pragmatic projects.

Fig. 3 Growth of CI numbers in Southeast Asia from 2006 to 2019. Authors' own design based on data retrieved from [Chen \(2020\)](#).

It needs to note that because of intensified criticism on CI's possible political and ideological intentions from mainly Western politicians, Hanban is no longer the host of CIs since June 2020. Instead, the Chinese International Education Foundation (CIEF), a non-profit charitable social organization founded by 27 Chinese universities, enterprises, and NGOs, is now in charge of the management of CIs (CIEF, 2021).

The overwhelming majority of partner universities of CIs in ASEAN countries is local higher education institutions in Guangxi province. Eight Guangxi borderland universities have participated in the set-up of CIs in four Southeast Asian countries, reflecting the influence of China's "bridgehead" diplomacy. Regarding the development of CIs in Southeast Asia, the periods of 2008–2010 and of 2015–2019 witnessed two fast growth points (as Fig. 3 shows), corresponding respectively to the announcement of "Double 100,000 Plan" in 2010 and the launch of BRI in 2015 as aforementioned.

The CI at the Royal Academy of Cambodia serve as an illustrative example. Starting from its inauguration, it has been endowed with the mission of symbolizing the good relationship between China and Cambodia. In December 2009, then Vice President Xi Jinping kicked off his official visit to four Asian countries, including Japan, South Korea, Myanmar, and Cambodia. Xi attended the opening ceremony of the first CI in Cambodia and delivered a public speech. He recalled the long history of friendly communication between China and Cambodia and defined the CI as a milestone in Sino-Cambodian people-to-people and cross-cultural exchanges to strengthen the current cooperative political and economic partnership between the two countries (Xinhua News, 2009).

To some extent, the CI at the Royal Academy of Cambodia has been acting like a local diplomat through offering language teaching services to the Cambodian government officials. There were 23 Chinese teaching bases and two CI classrooms supported by the CI at Royal Academy of Cambodia until December 22, 2019. Altogether 12 Chinese centers were set up in high-level government and military offices (Confucius Institute at Royal Academy of Cambodia, 2019). For classes taught at the Prime Minister's Office and the Senate as well as the Ministry of National Defense, the CI at the Royal Academy of Cambodia would arrange the state-sponsored teachers with rich language teaching experience.

Additionally, the CI at the Royal Academy of Cambodia has coordinated with China's Embassy in the Kingdom of Cambodia to organize social and academic activities. A typical example is a project that translated and published *Xi Jinping: The Governance of China I (Khmer version)* by the CI at the Royal Academy of Cambodia. The book launch was held at the Prime Minister's Office on April 11, 2017, witnessed by the Cambodian Prime Minister Hun Sen and the Director of the State Council Information Office of China. Other activities include seminars on Sino-Cambodian relations and BRI, "Chinese Bridge" Match (Chinese Language Proficiency Competition for Foreign College Students) in Cambodia with themes related to "Building a Community with a Shared Future for Humanity," Chinese Essay Competition about "China in My Heart," theme music composition of documentary film named *The Story of Time: Sino-Cambodian Friendship*.

China's higher education aid to Southeast Asia

With its burgeoning volume of development aid to developing countries during the past two decades, China's distinct donor logic has triggered intense debate among scholars, containing both criticism and defense. Critics share the viewpoint that despite the generosity and non-conditionality of most Chinese aid projects, China's true motivation still focuses on gaining access to raw materials (Brautigam, 2009; Tan-Mullins et al., 2010). In contrast, defenders usually refer to China's "win-win" donor logic that emphasizes on equal partnerships and mutual benefits (Yuan, 2011). They point out the advantages of adding an alternative besides Western donors especially in consideration of the China's development model as a useful reference point for developing countries (Wang, 2014).

Higher education aid is a key ingredient of China's development assistance to consolidate South-South cooperation, which is traditionally unfolded in the large number of scholarships for foreign students from less developed countries, institution or

program partnerships, and degree training or short-term human capacity building programs for both students and university professionals in Chinese universities and post-secondary vocational colleges. The scholarly debates, however, predominantly surround China's higher education engagement with Africa in forms of long- and short-term training/scholarship programs, CIs, stand-alone projects such as school construction, and 20 + 20 university partnership scheme.

In comparison, however, China's higher education development aid to the developing countries of ASEAN has been much less discussed. Given that China has employed not only development assistance but also non-development aid, low-interest loans, and investment agreements, its foreign aid has already reached a gigantic size and exerted a tangible influence in many Southeast Asian countries including Myanmar, Cambodia, Laos, Vietnam, Thailand, Indonesia, and Philippines (Lum et al., 2008). China's aid to higher education development in Southeast Asia consists of scholarships, training seminars for professionals, and school building projects.

For instance, the Ministry of Commerce of China (MOFCOM) Scholarship is a China Aid project to build intellectual capacity through master's and doctoral programs. It tends to elaborately design the curriculum with lessons from China's development model and foreign policy. In 2020, there were 32 universities designated by MOFCOM to recruit students. Seven programs in public administration and economics explicitly outlined their objectives as cultivating future leaders of developing countries via learning from China's development practices. The compulsory, elective courses and field trips contained in their syllabus were closely related to China's perspectives on public policy and development strategy.

The Academy for International Business Officials (AIBO, also known as Training Center of the Ministry of Commerce) is the only educational and training institution to administrate and coordinate all China-Aid training programs. It has been committed to telling China's stories to seminar trainees. The revised version of the *Work Manuals for Implementation and Management of MOFCOM's China-Aid Training Programs* released on 2010 listed the specific training requirements about China's national conditions. It requires that the training program's providers ought to choose site visits and field trips that promote both international communication and cooperation and trainees' recognition and understanding of China's national conditions (AIBO, 2012).

The Institute of South-South Cooperation and Development (ISSCAD) was another flagship China Aid project with funding from the Department of Foreign Assistance of MOFCOM. Based at Peking University, ISSCAD was initiated by President Xi Jinping on the High-Level Roundtable on South-South Cooperation at the 70th Anniversary Celebration of the United Nations in 2015. Aiming to share the development experience, it facilitates capacity building with mid-level to senior officials, managers and researchers from developing countries, including less-developed ASEAN countries. Its curriculum consists of China Immersion Program (China's development theory and practice) as the core course. It covers a variety of themes on economic system reform and development planning, China's opening-up and globalization and BRI in its one-semester-long China Immersion Program (ISSCAD, 2018).

Starting from 2015, the LMC was China's another sub-regional diplomacy in Southeast Asia with flagship higher education aid projects contained. The *Five-Year Action Plan of Lancang-Mekong Cooperation (2018–2022)* further supported China to establish vocational education partnership with Mekong countries. Premier Li Keqiang's address at the second LMC Leader's Meeting suggested that China would extend agricultural cooperation with countries along the Mekong River (Li, 2018). Within such a policy context, most recent higher education infrastructure and short-term training aid projects in Mekong countries related to agriculture and vocational training. The China-funded University of Kratie was the first public comprehensive university focusing strongly on agronomy in the Northeastern Cambodia. With 10,000,000 US dollars from China to construct its teaching building, laboratory, lecture hall, library, and cafeteria, its operation was officially started on April 25, 2018.

Sino-ASEAN higher education partnership

Along with China's successful developmental trajectory of moving from periphery to center, many Chinese universities have also climbed up in global ranking systems. Their performances have attracted an increasing number of Southeast Asian institutions to form partnerships or joint programs with them. Two higher education institutions located in Chongqing and Jiangsu respectively are cooperated jointly by Chinese and ASEAN counterparts. A total of 36 joint programs between China and ASEAN countries in the form of "3 + 1" "2 + 2" or "2 + 1" are running in Chinese universities. It merits attention that 25 cooperative programs are established with Singapore, ten with Malaysia, and one with Thailand (Wen, 2016).

Besides the joint programs operating within China, Chinese universities have recently begun to follow "go global" strategies to establish overseas campuses and joint programs in ASEAN countries. According to the data released by *Guangming Daily* (2016), Chinese tertiary institutions had already set up 98 overseas higher education programs, among which three MOE-approved international branch campuses had been established in Southeast Asian countries, including Soochow University (Laos), Xiamen University (Malaysia), Bangkok Business School of Yunnan University of Finance & Economics (Thailand). He and Wilkins (2018) have discussed the impacts of China's education-related soft power aspects on international branch campuses in Southeast Asia. Their interview data identify the necessity of the Chinese language, and cultural history and heritage, as well as China's exponential economic growth as driving forces for local students to choose Chinese universities' overseas campuses.

Moreover, borderland Chinese universities have initiated transnational joint programs in less developed ASEAN countries. For example, the "2 + 2" program launched by Honghe University (Yunnan) to operate in Vietnam was endorsed by MOE and the Ministry of Education and Training of Vietnam in 2011 (Honghe University Website, 2019). Additionally, the higher education forums and associations between China and ASEAN countries are also active in seeking more collaboration opportunities, including

annual China-ASEAN University President Forum, the ASEAN-China Academic Cooperation and Exchange Program, the Association of Pacific Rim Universities, and Universitas 21.

Especially for latecomer countries without well-developed higher education resources, higher education partnership with China usually serves as an icebreaker to strengthen diplomatic relations. For instance, the RUPP (Royal University of Phenom Penh)-DHY Chinese Language Center was co-established by Dali University, Honghe University, Yuxi Normal University, and RUPP in 2007. The incentive of the three Yunnan local universities was the guiding foreign policy of "bridgehead" strategy. Along with the announcement of China and ASEAN Free Trade Area, Yunnan stood out as the bridgehead facing Southeast Asia. Yunnan Provincial Party Committee and People's Government released the *Advice on Accelerating the Implementation of "Going Out" Strategy by Universities to Improve Higher Education Internationalization Level* in 2006 (MOE, 2011). Through promoting higher education internationalization, it fulfills "good neighbor" and "peaceful development" foreign policies. Related initiatives consist of the establishing ten CIs and Chinese language centers in Southeast Asia and South Asia (Yunnan Provincial Party Committee and People's Government, 2006).

During his investigation in Yunnan in 2009, China's then President Hu Jintao officially stated a plan to set up Yunnan as the bridgehead. Later, the State Council released the *Advice on Supporting Yunnan Province to Accelerate the Construction of Being the Key Bridgehead Facing the Southeast*. It clarified that bridgehead construction would fully carry out the guiding principle of China's diplomacy of "building friendship and partnership with neighboring countries" and the foreign policy of "an amicable, secure and prosperous neighborliness." One of the detailed projects was to support the education exchange and cooperation between higher education institutions in Yunnan and Southeast Asia (State Council of China, 2011).

Besides being the icebreaker for "bridgehead" strategy at the beginning, higher education partnership has continued to reinforce diplomatic relations between China and Southeast Asia. Taking RUPP-DHY Chinese Language Center again as an example, the Yunnan delegation led by Governor Li Jiheng and Vice Governor Gu Zhaoxi of the Yunnan province visited the Greater Mekong Sub-region from March 25 to April 6 in 2012. Before paying a visit to Cambodia, they were informed that there had been a successful higher education partnership program at RUPP. Then, the Education Department of Yunnan assisted Dali University to apply for the donation of Chinese language laboratory.

On 6 April, the governor and the vice governor attended the China (Yunnan Province) and Cambodia Economic and Trade Cooperation Conference. The governor stressed the significance of enhancing people-to-people cultural communication between Cambodia and Yunnan through educational collaboration in his keynote speech. After conference, the Vice Governor visited RUPP and unveiled the nameplate of Language Laboratory sponsored by Yunnan Provincial Government with a donation of devices of more than 200,000 RMB value (Yunnan Daily, 2012). While the inauguration of language laboratory has laid a solid foundation for more far-reaching higher education partnership between both sides, it is a clear diplomatic symbol of Yunnan to deepen its amicable neighborhood and economic and trade cooperation with Cambodia.

Concluding remarks

The BRI serves as a powerful catalyst to deepen the influence of both economic and soft power of China in Southeast Asia. Thereinto, higher education plays an active role, echoing China's peripheral diplomacy to further diffuse its cultures and values. Remarkably, the ascending performance of Chinese universities in STEM has become an emerging attraction to Southeast Asian neighbors. Meanwhile, China's achievements in scientific research and development break the fault line of its economic development model. It is not unexpected to find that the export of China's development model has recently become an indivisible part of its higher education aid projects. Although many approaches including student mobility, language training, educational development assistance, and university partnership have all tried to incorporate China's foreign policies across time, a systematic and coherent mechanism of China's higher education engagement with Southeast Asia has not been formulated yet.

Introduction

Datafication is a new word for a process with a long history: the translation of things into quantitative information. The term came into popular usage around 2013 with the publication of Mayer-Schonberger and Cukier's (2013) book, *Big data: A revolution that will transform how we live, work, and think*. The term is closely linked to the emergence of big data analytics and thus the production, analysis and use of *digital* data. This article will focus specifically on developments in the datafication of education over the past two decades. In particular, we consider how datafication has contributed to change in higher education over this period and identify three emergent challenges and one effect that it produces for educators and policymakers.

In order to discuss datafication, it is necessary to begin by considering data as the root word and the product of the process. Data now generally refers to digital data, but the term has a longer and broader usage extending back to the early eighteenth century. Data has referred to different things over this period, but it has always retained the sense of "that which is given prior to argument" (Rosenberg, 2013, p. 36). Data are distinct from facts, evidence and truth. In the form of principles and premises, or quantitative information produced through observation, experiment or digital capture, data have always provided a basis for analysis and argument from which facts and evidence may emerge. As Rosenberg (2013) writes, "[e]lectronic data, like the data of the early modern period, is given. It may be that the data we collect and transmit has no relation to truth or reality whatsoever beyond the reality that data helps us to construct" (p. 37). Datafication is a process that generates ever-increasing volumes of material for interpreting, representing and remaking our worlds.

Mayer-Schonberger and Cukier (2013) define datafication as "taking information about all things under the sun ... and transforming it into a data format to make it quantified" (p. 15). The emergence of datafication as a distinct phenomenon is closely linked to digitalization and significant increases in computational capacities that enable greater volumes and varieties of data, indeed all data in some cases, to be captured and analyzed increasingly quickly (Kitchin, 2014). The constructive nature of datafication is exemplified in the use of large digital data sets to perform predictive analytics, which have driven recent excitement about the promise of big data. Datafication enables us to make predications and shape the future, beyond simply generating information about the past or present. However, this world making capacity of big data brings new risks. Mayer-Schonberger and Cukier (2013) argue that "big-data predictions render the future less open and untouched ... our future seems already sketched in faint traces that are discernible to those with the technology to make them apparent" (p. 194). Datafication is thus not only a relatively new digital technology, but also a thoroughly political and economic one that grants those who are able to capture and analyze data the ability to turn potential futures into a set of probable and actual ones.

As with practically every aspect of contemporary life, datafication has had a significant impact in education (e.g. Bradbury and Roberts-Holmes, 2017; Hartong and Förschler, 2019; Sellar, 2015; Williamson, 2017; Wyatt-Smith et al., 2021). For the purposes of this article, we will limit our discussion to formal education, and we will use the specific example of higher education to trace the development of datafication over the past decade and into the near future. Williamson (2017, p. 5) defines datafication in education as "the transformation of different aspects of education (such as test scores, school inspection reports, or clickstream data from an online course) into digital data". Recent studies of this phenomenon build on a longer tradition of research into the role that quantification has played in transforming policy and governance (e.g. Gorur, 2014; Grek, 2009; Lawn, 2011; Lingard, 2011; Ozga, 2009). Over the past two decades, many government departments and educational institutions have moved beyond routinely collecting data to monitor the performance of students, educators and institutions, and are seeking to embed digital datafication as a foundational element of organizational and educational strategy. Private actors, particularly the education technology sector, now also accrue vast quantities of digital data through the use of their products and services. While test scores and attendance records have been used to quantify educational engagement and performance since the 19th century (Stephens, 1998), digital data are

increasingly shaping educational experience in fundamental ways through, for example, the predictions that guide policymakers and the algorithms that underpin personalized learning.

Datafication is both a product of, and a resource for, imagined futures. Drawing on the work of Sheila Jasanoff, Williamson (2017) argues that it is in sociotechnical imaginaries – “the visions and values that catalyze the design of technological projects” (p. 16) – that “transformative scientific ideas, technological objects and social norms become fused in practice and help to sustain social arrangements or create new rearrangements in cultures, institutions and routines” (p. 16). Datafication is driven by desire for data and by technologies that enact this desire, which together contribute to arranging education in new ways (Thompson and Sellar, 2018).

The COVID-19 pandemic is accelerating the use of digital platforms in education, and thus also the datafication of education, because the use of these platforms generates large volumes of data. Many people quickly came to rely upon new technologies to teach, learn and meet after the pandemic caused the closure of schools and universities, and the EdTech industry saw this as an opportunity to disrupt education systems and embed datafication through the use of their platforms (Williamson and Hogan, 2020). Moreover, investment in the EdTech sector doubled in 2020 and the profitability of this sector is predicated on the collection, aggregation and monetization of data through the extraction of economic rents (Komljenovic, 2021). Datafication will drive the next generation of commercialization in education, and perhaps even the disruption of public education systems. In this context, addressing the emergent challenges that datafication creates for education has become even more urgent.

The datafication of education has occurred in symbiotic relationship with the rise of “evidence-based policy” approaches, and debates about its risks and benefits often trace well-worn lines of contestation between qualitative and quantitative research paradigms. These debates pose datafication as an epistemological problem, raising questions about the most reliable ways to generate evidence and facts from data. Datafication is also commonly posed as an ontological problem when it is critiqued as a technology that converts human activity and experience into digital data that encourage instrumental-rationalist framings of education and its subjects (i.e. human capital). While both of these problems are important and demand attention, our primary aim in this article is to provide an organized overview of new forms of digital datafication, focusing on the practices and practical effects of data, such as deprofessionalization, privatization and the creation of new inequalities.

This article is divided into three main sections. We begin by providing a brief overview of the evolution of datafication across different education sectors and we consider some of the impacts it has had on policy and pedagogy. This discussion is necessarily limited, but provides a general perspective on datafication in education and its antecedents. We then turn to the example of higher education and discuss how technological advances, such as the Internet of Things (IoT) and the use of Virtual Learning Environments (VLEs), have provided the conditions for higher education institutions (HEIs) to pursue new data-driven practices. These include using data to track and support students with their studies and to pursue interventions to improve learning outcomes and wellbeing. The use of data to guide interventions is linked to the capacity to predict student behaviors and outcomes, and we consider the predictive use of data and its use to train algorithms that automate aspects of education, for example students engaging with chatbot services. The final section of the article explores three emergent challenges and one effect that need to be considered as the datafication of education intensifies: (1) the deprofessionalization of educator’s work; (2) the creation of new inequalities; (3) the privatization of education; and, as a result, (4) the need for new modes of regulation.

A brief overview of datafication in education

Schools and universities have a long history of translating things and activities into quantitative formats. Spelling tests were developed during the late 19th century, closely followed by IQ tests in early 20th century (Symonds, 1940). The first international large-scale assessment (ILSA) was developed in 1950s and national assessment programmes emerged during the latter part of the 20th century, often linked to new accountability agendas. From the 1990s, the scale and scope of ILSAs has grown and large-scale assessments have evolved to quantify a more diverse set of student attributes (Sellar and Lingard, 2014). National and international assessments of students have contributed to growing volumes of information that are used to shape policy and practice. These assessment data have been combined with other data relating to student behavior (including attendance) and demographic data to monitor and manage education systems. However, the emergence of new modes of datafication involves larger volumes of digital data being generated more quickly, stored in databases that are increasingly joined up, and used for a range of new purposes.

The datafication of education extends from early years settings to post-secondary education. Children are now exposed to significant processes of datafication and teachers in early years and primary settings are now under significant pressure to record data regarding children’s development (Bradbury and Roberts-Holmes, 2017). The “data double” of the child becomes a yardstick for assessing how they are progressing, often substituting for an assessment of the individual themselves (Bradbury, 2019). This attraction to detailed recording of data on student progress has influenced the pedagogical approaches that are adopted in the classroom, because those that are easily measured lend themselves to datafication and educational imaginaries in which student and teacher performance is governed through data. This can lead to teachers feeling conflicted when their educational values and professional knowledge are at odds with the practices that datafication encourages or requires (Roberts-Holmes, 2015). A culture of performativity has also emerged as the measurement of children and young people in schools has intensified, resulting in teachers’ work being evaluated and rewarded based on data (Ball, 2003). Cultures of performativity have intensified in schooling with publication of league tables linked to parental school choice and school funding. New modes of accountability linked to performance data have had a significant impact on how the purposes of education are imagined and how judgments are made about educational practices.

As young people move into secondary schools and through to post-secondary education, processes of datafication can become increasingly normalized and opaque. Datafication increases as students generate more digital trace data as they interact with a variety of education institutions, platforms and applications. Students also engage with a growing number of formative and summative assessments as they progress through the stages of education, creating possibilities for using data from past assessments to predict future performance and guide “early interventions”. In this example, we can see how datafication and prediction shape evaluations of students’ potential and pedagogical decision-making. Indeed, datafication increasingly informs pedagogy, curriculum and assessment, and in the process can augment, discredit or replace teacher professional judgment, which provides a basis for teaching as a profession.

Over the past decade, we have also observed the promotion within school settings of personalized learning that is tailored to the needs of the individual student (Williamson, 2016). This approach is premised on the view that real-time data generated through the learning process can enable curriculum and pedagogy to be adjusted to meet individual abilities and needs, enabling learners to maximize their potential to achieve successful outcomes. Parents can also more readily access data on their child’s progress and students are increasingly expected to reflect upon their own digital footprint and set educational targets on this basis, providing an example of how the quantified self is enjoined to continually monitor and modify their behavior based on measurements and targets (Lupton, 2016).

In higher education, processes of datafication have been lauded as a means for students to gain greater insight into their learning and wellbeing. Institutions also see other benefits from datafication, including, for example, intervening with students to address engagement in more targeted ways that may translate into improved retention rates. Data are also valued as market intelligence and as a means to improve recruitment and admissions processes (Jisc, 2021). The increased scale of university student bodies and the research community within the higher education sector has allowed it to pioneer new approaches to datafication in education. These developments are often described using the label of learning analytics, and many HEI’s now have staff and student facing applications that quantify learning and progress. HEI’s also support research communities that explore what can be datafied and how such “intelligence” can be actioned. At the same time, there is a significant number of scholars offering a critical commentary on practices of datafication across all education sectors, and working to develop critical data literacy for both staff and students. Datafication is often controversial and increasingly subject to competing educational imaginaries, representing a tension between the perceived usefulness of data-driven “business intelligence” and critical perspectives that highlight risks of various kinds.

Datafication in higher education

Our discussion of datafication in higher education will focus on developments over the past two decades linked to the growth of online learning and digitalization. Distance and e-learning experienced significant growth in the 2000’s (Radford, 2011). These developments represent a significant break from face-to-face teaching and are a key milestone in the growth of capacities for datafication across the sector. E-learning led to the introduction of a variety of digital applications and platforms, including the widespread introduction of VLEs in colleges and universities. While the introduction of e-learning was not inspired initially by imaginaries of datafication, it produced a shift that enabled educational processes and events to be more readily captured as digital data.

Distance and e-learning approaches thus created fertile conditions for the growth of datafication and new possibilities for data use. The digital footprint created by students leaving traces when they interact with virtual learning environments and other applications could be analyzed for insights into student learning. For example, clickstream data captures time-stamped records of click events as students interact with online resources and activities. Such data are valued for their potential to provide different insights than those made possible by intermittent assessments and teacher observation. However the usefulness of such data has also been described as “partial and noisy” (Baker et al., 2020). Indeed, the tension between the promises of datafication and its technical limitations has often resulted in sociotechnical imaginaries outrunning actually existing capabilities.

Increased awareness of the potential usefulness of digital data can be traced back to the rise of two closely related areas: educational data mining (EDM) and learning analytics. EDM and learning analytics share common assumptions about the value of data-driven approaches to education. The two fields emerged at a similar point in time, with the first EDM international conference being held in 2008 and the first international learning analytics conference taking place in 2011. Both fields have much in common, but there are important differences: learning analytics aims to use data to aid human judgment while EDM focuses on automated data analytics and adaption of learning processes without the need for human intervention (Siemens and Baker, 2012). Both approaches have accelerated efforts to capture and use a greater volume and variety of data in higher education.

In the last decade, we have observed growth in datafication beyond digital traces left by students as they interact with educational applications on individual computers. This expansion is linked to the development of the Internet of Things (IoT): the ever-expanding network of objects that can communicate and exchange data over the internet through sensors and software (Rouse, 2019). The network effects created by the move to online learning and the automatic data capture that occurs through the use of digital devices marks an important point in the rise of big data and the datafication of human activity, because the IoT enables data to be generated and recorded without the need for human data entry (Ashton, 2009). The IoT also provides new possibilities for data to be aggregated in novel and abstract ways without human involvement. Kitchen (2014) identifies “relationality” as one of seven characteristics of big data and this describes how data sets are joined up across a wide variety of interoperable devices, platforms and applications. For example, the growth in use of handheld devices, wearables and sensing technologies makes it possible

to capture, combine and analyze huge volumes of data relating to a wide range of student activities. In addition to recording activity on personal computers, the use of wearable cameras, biosensors (recording heartbeat, body temperature, skin conductivity etc.), location tracking and eye tracking is being pursued as a means to provide better educational experiences for students (Blikstein, 2013). New possibilities and challenges are created by the increasing ubiquity of often invisible technologies capable of recording and sharing data.

The emergence of the IoT has also changed the nature of physical spaces in higher education. Easterling (2012, p. 1–2) describes the IoT as “... a world embedded with so many digital devices that the space between them consists not of dark circuitry but rather the space of the city itself”. The HE sector has embraced this development in its pursuit of smart campuses, which can be seen as a subset of the Smart City (Thrift, 2014). The concept of the Smart City describes the use of data collected via various methods to manage assets, resources and services efficiently and to improve the experience of the population living in urban areas (Lai et al., 2021). Examples of specific uses of such data streams can range from managing traffic flows to detecting residents smoking in unauthorized zones. Like datafication more broadly, discussion of Smart Cities has tended to be either “idealistic and/or technical, or critical but lacking in nuance and/or empirical evidence” (Kitchin, 2015, p. 135).

There are many parallels between the use of data in Smart Cities and the rise of the smart campus. For example, in the UK the Joint Information Systems Committee, now known as Jisc, support HE institutions and the Further Education (FE) sector with network and IT services. Jisc have recently argued for the need to evolve the existing infrastructure to support smart campuses. Jisc’s senior co-design manager, James Clay, described the shift as follows:

The smart campus is already here; the technology, sensors and data analysis capability are all available, but it isn’t all joined up and so has limited scope in terms of what we can learn and how we can use the knowledge. What we need now is the intelligent campus, where data from the physical, digital and online environments can be combined and analyzed, opening up vast possibilities for more effective use of learning and non-learning spaces. (Owen, 2018, online)

The intelligent campus relies on more joined-up data to provide the informational material that can shape decision-making processes. Examples include using occupancy data from classrooms and common areas to make effective use of campus space, which could enable staff and students to identify the busiest and quietest times to access the library (Sutjarittham et al., 2019). In conjunction with capturing data on the physical aspects of the campus, providing more relevant messaging through digital signage has also been explored to enable more targeted and real-time communications designed to improve student experience (Owen, 2018). Jisc have also emphasized the need to join up data sets that use RFID tracking of physical spaces correlated with attendance data, VLE data, student records data and data from other online services.

As datafication becomes more ubiquitous, many in HE hope that greater insights can be provided. In addition to measuring behavioral data relating to student learning, attendance or presence in physical spaces, data are now being used to consider other aspects of students’ lives. EDM techniques are being used to conduct sentiment analyses based on data from student assignments, contributions to online discussion and social media footprints (Altrabsheh et al., 2013). These analyses can be used to make judgments about how students are feeling rather than what they are doing, focusing on which aspects of the curriculum students enjoy or whether they feel stressed about their studies. The aim of these approaches is to help staff understand their students better and thereby improve their experience. The learning analytics field has argued that areas such as sentiment analysis, alongside practices such as discourse analysis, Social Network Analysis (SNA) and emotion analysis, provide data that can be used to create a more intimate picture of a student’s affective states during their studies (Sclater et al., 2016).

One rationale for using data to capture more than just digital traces relating to academic performance is the potential to support students’ mental health and wellbeing. It is believed that data can be used to provide enhanced insight in this area, allowing educators, counselors and support services to intervene with students who may be struggling (Rogers, 2019). There have been tragic occurrences in schools, colleges and universities where students have experienced mental health issues, and these cases are not always easy to detect. This has led to campaigning for further access to and utilization of data so that early interventions can take place (Hall, 2018). Although there are grounds for further extraction and analysis of data in these areas, there are also concerns about data accuracy and false positives when targeting students who may be identified for intervention. There are also questions about how such data can be effectively used, and consideration must be given to how tutoring, support and counseling services should react to such insights (Ahern, 2018; Hughes et al., 2018).

The focus on pre-emptive intervention reflects the predictive capabilities that big data can provide (Davis, 2018; Raley, 2013). In recent years, there has been a trend toward future-oriented governance that seeks to anticipate and pre-empt problems (Anderson, 2010; Massumi, 2007). It is no longer sufficient to know what happened or what is happening; rather, policymakers and organizational leaders want to know what will happen next. Within education, predictive analytics and modeling have become more widely used to identify “at risk” students by correlating demographic data with learning data (Kuzilek et al., 2015). These approaches aim to enable educators and support staff to intervene in a more targeted and appropriate manner, leading to increased student engagement and outcomes. Scholars have critiqued the use of datafication practices for the purposes of prediction on the grounds of data accuracy and bias, however even where data may be considered accurate, predictive analytics runs the risk of establishing a form of determinism (Kitchen, 2014; Raley, 2013). For example, people who are predicted to achieve low outcomes as a learner may be prescribed less challenging curriculum and enact the role they have been assigned.

The next step beyond prediction is prescription and automation (Sclater et al., 2016; Sellar and Gulson, 2021). This is exemplified by educational recommender systems that provide the “best” content for students based upon algorithmic calculations. Work in this area is still emergent, but it forms the basis for the pervasive discourse that education technology can personalize learning. This

rationale is inspired by the function of digital platforms such as Netflix, Facebook or Amazon, which serve content for us to consume, purchase or watch based upon datafication of our previous activity. The pursuit of more customized approaches to pedagogy, tailored to the individual learner, have received significant interest. Others in the educational community have raised concerns about the narrow view of learning embedded in the notion of personalization, arguing that this lessens opportunities for collaborative social learning (Harsim, 2017).

The growth of datafication has also created the conditions for the application of artificial intelligence (AI) in education (Williamson and Eynon, 2020). AI, and specifically machine learning, enables the automation of educational processes using algorithms trained on large data sets. A common example is chatbot services that enable students to ask questions and receive answers generated by algorithms. Such services are now being used in a variety of sectors, and this includes the use of intelligent personal tutoring systems (Luckin et al., 2016). Similar AI techniques are being used to facilitate and prompt student discussion during collaborative exercises. AI is also being trialled as a way of offering real time feedback to students on assignment work (Luckin et al., 2016).

Views on the benefits and risks of embedding AI into the fabric of education are mixed. Advocates claim AI will revolutionize our educational institutions, with automation leading to increased efficiency by helping teachers to “... maximize student success and prepare them for the future” (Ayoub, 2020, online). From this perspective, AI can save teacher time by taking over tasks such as providing written feedback on assessments and answering student queries. This will ostensibly enable teachers to spend more time with students engaging in aspects of teaching and learning that cannot be automated. However, others argue that increased automation could easily go beyond complementing educator’s work and lead to the deprofessionalization of teaching and a lack of autonomy for teachers when making decisions about what is best for learners (Schiff, 2021). The question of whether it is possible or desirable for the role of the teacher to be replaced by artificial intelligence has also been raised (Selwyn, 2019). Concerns about technological unemployment created by automation have already been realized in some areas, and while teaching is predicted to be less susceptible to automation (Frey and Osborne, 2017), there is a growing concern that the cost efficiencies gained with the use of AI will be used to reduce the need for human teachers. Some scholars predict that it is a case of when, and not if, academic work, including teaching, will become automated (Ivanov, 2016).

Datafication is now thoroughly intertwined with the development of education technology and provides a basis for the next generation of digital platforms in which AI will be embedded. There is a growing body of literature investigating the use of education technology and raising critical questions; for example, whether it is possible to capture sufficient data and analyze it appropriately to ensure that automated pedagogy is properly contextualized and accessible for all (Bradbury, 2019; Selwyn, 2019; Williamson, 2016). In addition to these technical concerns about the increasing use of education technology and AI, we must ask fundamental questions about the purposes of education and the forms that we want our education systems to take. Do we want data analytics and AI to be deployed in education as a means of automation, or should it be utilized to augment human intelligence (Harasim, 2017). The latter perspective encourages exploration of how we can use AI appropriately, ethically and cautiously in a manner which aligns with societal and community views about the purposes of education.

Emerging challenges

As we have shown, the emergence of datafication in education serves as a critical link between longstanding data-driven accountability agendas in schooling (Lingard et al., 2017; Ozga, 2009), new approaches to data analytics and the increasing application of AI in education. The challenges and effects raised by datafication are diverse and complex. Here we focus on three challenges and one resulting effect:

1. The risk of data-driven automation *deprofessionalizing* teachers;
2. The creation of new *inequalities* for students;
3. The making of new data-driven markets, products and services that contribute to the *privatization* of education; and, as a result,
4. The need for new *regulatory* approaches in response to these challenges.

In our discussion of the three challenges, we broaden our perspective on datafication to include education technologies that generate or require large volumes of data. Datafication goes beyond explicit uses of data by policymakers and educators; it is now embedded in the development and use of digital platforms that hold the potential to disrupt education in significant ways.

Deprofessionalization

Datafication has long contributed to the deprofessionalization of teachers’ work by contributing to neoliberal modes of accountability that have replaced societal trust in teachers as professionals (Ranson, 2003). However, the role of datafication in the creation of new education technologies, including AI, further increases the risk of deprofessionalization. Educators are often disconnected from the design and function of digital platforms and applications that shape pedagogy, curriculum and assessment. These platforms can enter learning spaces as “black boxes” that influence, or even substitute for, aspects of professional judgment and decision-making.

The professional autonomy of teachers to shape the learning experience of students is a longstanding principle enshrined in the 1966 UNESCO and International Labor Organization (ILO) *Recommendation Concerning the Status of Teachers*, which states that teachers:

should be given the essential role in the choice and the adaptation of teaching material, the selection of textbooks and the application of teaching methods ... [and] be free to make use of such evaluation techniques as they may deem useful for the appraisal of pupils' progress. (UNESCO/ILO, 1966, p. 8)

The growth of education technologies developed by agencies, and in contexts, disconnected from teachers' professional judgment undermines this principle. Digital platforms employed in education are not inherently problematic developments for education systems, the teaching profession or students; indeed, they may provide important benefits and opportunities. However, their growth and spread does undermine the profession if teacher judgment does not inform the design and use of new technologies, and when the function of these technologies limits teachers' ability to choose and adapt teaching methods, materials and assessments. Moreover, the sociotechnical imaginaries driving datafication frequently represent the teaching profession as anachronistic and in need of new technologies developed by commercial actors (Williamson and Hogan, 2020).

Data-driven developments in education technology thus change the conditions and capacities for teacher professional autonomy. The data generated by these technologies may be used to evaluate teacher performance, further contributing to the deprofessionalizing effects of accountability agendas. Finally, while automation is considered to present a lower risk of technological unemployment in education, it will change the nature of teachers' work and will have some impact on the number and nature of jobs in the sector. To address this challenge, the teaching profession and education researchers must actively promote and explore complementary uses of data-driven technologies that enhance the work of human educators while challenging the view that it is desirable to replace narrow elements of this work that can be automated. At the same time, educators and researchers should identify how professional judgment can be re-connected to the development and use of new data-driven technologies.

Inequalities

Datafication has the potential to exacerbate existing inequalities that shape educational opportunities for learners and as well as to create new inequalities linked to access and resource allocation. Selwyn et al. (2020) argue that future developments in education technology have significant potential to create new forms of digital inclusion and exclusion. As with other aspects of education, "[t]hose individuals who are well-resourced and have strong educational backgrounds are likely to benefit the most from digital education" (p. 2). Lack of access to expensive devices required to use the digital platforms and applications driven by the datafication of education may create new forms of exclusion. Data analytics enabled by these platforms and applications may also influence the allocation of resources to students and the pedagogies and curricula to which they are exposed.

Datafication may also exacerbate longstanding biases in education and introduce new ones when algorithms are trained on biased data sets and make decisions about students' current and future performance. Slade and Prinsloo (2013) warn that institutions must be mindful of stereotypes and prejudices that algorithms may perpetuate, suggesting that students must be allowed the freedom to act outside of their data profiles to avoid determinism and self-fulfilling prophecies. Similarly, The Open University (no date, online) states in its *Policy on Ethical use of Student Data for Learning Analytics* that "[s]tudents should not be wholly defined by their visible data or our interpretation of that data". This principle reflects concerns about transparency and "black boxing" (Knox, 2017) of algorithmic prediction and decision-making. Students and teachers have the right to understand how data has been aggregated and analyzed to ensure that decisions can be understood contextually and challenged where necessary (Slade and Prinsloo, 2013; Sclater, 2016).

Current datafication practices offer a partial representation of students learning, progress and well-being. Recognizing this partiality and potential bias is a critical element of staff and student data literacy, which is important to ensure that datafication does not exacerbate educational inequalities. Education researchers must hold new technologies up to critical scrutiny to identify risks created in their development and use.

Privatization

The privatization of education can occur endogenously and exogenously (Ball and Youdell, 2008). First, private sector approaches can be imported into the public sector, in order to make education more like a business (privatization of education). Second, the public sector can be opened up to private actors, involving them in the design, management and delivery of different aspects of public education (privatization in education). Often these two approaches go hand in hand. The EdTech industry is increasingly contributing to privatization in education (Hogan and Thompson, 2020; Williamson and Hogan, 2020). This occurs when schools, universities and governments purchase their products or contract out services to EdTech companies through business-to-business transactions.

However, a new type of privatization of education is also emerging, and we argue that it is sufficiently different from warrant its own description: the Uberization of education. Uberization describes the disruption of an existing industry and its business models through the introduction of digital platforms that enable peer-to-peer transactions. Unlike other forms of privatization, Uberization does not seek to alter the model of public education; rather, private actors aim to break this model by introducing new ways to sell education directly to customers (business to customer). Uberization is not new, of course, but the disruption that Uber caused to the taxi industry has not yet occurred in education. With the unbundling of higher education (McCowan, 2017) and the growth of business to customer markets and business models premised on monetizing data and extracting economic rents from users, this form of privatization is likely to increase, particularly in higher education (Komljenovic, 2021). Datafication is central to this development.

The private sector can, and does, make valuable contributions to public education. These contributions can be beneficial if they are transparent and support equitable approaches to sustaining public education for all students. Importantly, and linked to the challenge of deprofessionalization, these contributions should be shaped by teacher professional judgment and held to the profession's standards of practice. However, this is not the case with many new digital platforms, particularly when the education provided by these platforms is developed and delivered by teachers who are not qualified, or these platforms are designed to function in ways that are inscrutable to human users.

Regulation

Broad societal concerns about the rise of datafication, predictive analytics and AI have led to debates about data regulation and ethical use of data. New regulatory frameworks, such as the General Data Protection Regulation (GDPR) in Europe, have been introduced to ensure that the capture, processing, and use of personal data protect rights to privacy. New codes of conduct and ethical frameworks have also been published in the higher education sector to support ethical data use (Tsai and Gasevic, 2017). The recommendations in these documents generally focus on transparency, consent, privacy and access (Slade and Prinsloo, 2013; Sclater, 2016; Open University, no date). A key principle evident in these policies is ensuring that students know how they are being datafied, for what purposes and how they can “opt-out” if they wish to do so.

Regulatory change is also being pursued in relation to the use of AI. For example, the AI Now Institute's regular reports have made recommendations designed to prevent AI from contributing to widening or creating inequalities and exacerbating discriminatory practices in society (Crawford et al., 2019). Bias in facial recognition technology and its inaccuracy in identifying people of color represents one high profile example of such discrimination (Lohr, 2018). The AI Now Institute's reports offer not only critique, but a vision for AI and a set of ethical standards that should guide its use.

Data ownership and the distribution of value generated from data is another area that requires further regulation (Savona, 2019). Savona (2019, p. 18) argues that “data use by non-owners might legitimately require their owner to be compensated, and the non-owner to abide to specific duties”. Currently, only a small number of actors have the ability to extract financial value and benefit from data, often through the creation of assets that are protected by intellectual property rights, and this power imbalance must be readdressed as the economic value of data increases. While attention has focused on questions of data privacy, discussion about the fair distribution of data's value represents a relatively new area of research and policy concern and more work is needed in this area.

Conclusion

In this article, we have provided an overview of datafication in education using higher education as our primary example. While acknowledging the important antecedents to datafication in the 19th and 20th centuries, we have surveyed developments in digital education over the past two decades during which digital datafication has accelerated rapidly. Data-driven education policy and digital datafication have had pernicious and perverse effects in education. Our aim in this article has been to provide an organized overview of new forms of digital datafication, focusing on the challenges it creates, such as deprofessionalization, privatization and the creation of new inequalities, and the need for new kinds of regulation. In particular, we have considered how data-driven changes in education arise not simply from new technological capacities, but from the desires and imaginaries that drive the development of these capacities.

The datafication of education is happening simultaneously with datafication in other sectors and within society at large. This is not a new or isolated trend and it is likely to be irrevocable. The three key challenges that we have discussed—deprofessionalization, inequalities, and privatization—do not cover the full range of issues raised by datafication, but we argue that they are primary areas of concern today. Approaching the problem of datafication from epistemological perspectives on the evidence generated from data or the risks and benefits of technology for humanity remains important, however we believe that the problem also requires constructive critique and experiments with critical approaches to datafication that aim to strengthen public education and counter the harmful effects of surveillance capitalism (Zuboff, 2019). For both pragmatic and strategic reasons, we argue that opposing datafication and the growth of data-driven technologies is likely to be unsuccessful; more creative and engaged approaches are needed to push these developments in directions that can benefit educators, students, communities and societies.

Did Colonialism ever end? In our complicated globalized world operating on the basis of international treaties and agreements, remnants of the past colonial system are evident everywhere. In this article, I review the development of colonialism with its economic ramifications. As the great European powers granted independence to their former colonies, a new world order arose, one that has been labeled Neocolonialism with an attendant imbalance of power and stark inequalities between the developed and developing world. The wealthy powerhouses of the world continue to retain some form of control over the developing world usually in the form of economic influence. The connection of globalization and neo-liberalism to the new imperialist project is discussed. The place of education in the development of neocolonialism is also considered along with the role of powerful European languages, primarily English, as a means to making neocolonialism possible and sustaining it.

Background and context

From time immemorial, powerful states have exerted imperialistic control over weaker ones, expanding their territories, creating colonies, using their superior military force to subjugate the people for use as slave labor or being pressed into service for the armed forces. The examples of the Chinese, Roman and Mongol Empires come to mind when one thinks of widespread early colonialization.

The economic drivers of colonialism cannot be underestimated. European countries recognized that territories in Asia and Africa possessed wealthy commodities and resources that they coveted. The European nations began setting up trading posts as early as the 16th Century, as for example the British East India Company established in 1600 or the Dutch East India Company, set up in 1602 in Indonesia. Other European trading nations like France, Belgium, Portugal, Spain and Denmark among others began their inroads into Asia, South America and Africa through the establishment of such trading companies. Soon the process of colonialization had taken root. Colonialism basically involves conquest of a region by another to allow for exploitation of the conquered territory's resources to the profit of the conqueror. The rules and policies of the colonizer are imposed on the conquered. As [Horvath \(1972\)](#) explains, colonialization is a "form of domination—the control by individuals or groups over the territory and/or behavior of other individuals or groups" (p. 46). Some of the best-known sociologists and historians of colonialism such as [Achebe \(1958, 2000\)](#), [Fanon \(1967\)](#), [Nyerere \(1968\)](#), [Guha \(1998\)](#), and [Mann \(2006\)](#) have highlighted the pervasive nature of colonialism, its psychological and cultural effects that have had a strong impact on education, politics and the economy of the colonized territories. This has been carried over into the times of neocolonialism as will be discussed below. At this point, I will focus on economic outcomes of colonialism.

Colonialism's contributions to economic hegemony

Nowadays we speak of globalization, neoliberalism and imperialism driven by the force of the world markets. And yet the global reality today had its roots in the great trading companies of the 16th, 17th and 18th centuries that colonized the world outside of Europe. Much colonial enterprise was controlled not directly by powerful European states but rather by the trading companies they had set up and given free rein to infiltrate the economies all over the world with the goal of enriching the European nations.

Mercantilism was the operating economic principle whereby a colonized nation's economy was regulated and controlled by the mother nation in order to increase state power of the colonizer at the expense of rival powers. As defined by the Encyclopedia Britannica:

Mercantilism contained many interlocking principles. Precious metals, such as gold and silver, were deemed indispensable to a nation's wealth. If a nation did not possess mines or have access to them, precious metals should be obtained by trade. It was believed that trade balances must be "favourable," meaning an excess of exports over imports. Colonial possession should serve as markets for exports and as suppliers of raw materials to the mother country. Manufacturing was forbidden in colonies, and all commerce between colony and mother country was held to be a monopoly of the mother country (McKenna, Encyclopaedia Britannica on-line).

Spain profited handsomely from its colonized areas in the New World. Britain likewise expanded its empire worldwide. Indeed, at one time it could be said that the sun never set on the British Empire. The favored commodities such as gems and precious metals came from Africa and Asia. The sugar plantations in the West Indies also provided a valued commodity such that at one point, Britain considered trading its colony Canada to the fledgling United States for an island in the West Indies with sugar plantations!

By the 18th Century much of the world had been colonized by Britain and other European powers. However, the situation could not last and after the American Revolution, 1775–83, Britain lost its 13 American colonies but retained Canada and several islands in the Caribbean in the so-called new world. Spain and Portugal lost their South American colonies early in the 19th Century. Still, colonialism was alive and well in Africa and Asia. One has only to consider the Berlin Conference of 1884 where Otto von Bismarck convened representatives of the European nations to decide upon the division of African territories to fall under the power of the European powers. The African people had no say in the way their homelands were partitioned (Heath, 2020). The Europeans continued to exploit the people and riches of Africa and Asia while claiming to have accepted the challenge of civilizing the so-called Dark Continent to bring it up to the enlightened state the Europeans enjoyed. Following the exhortation of Kipling's famous poem, "The White Man's Burden" (Kipling, 1899), the imperialists tried to justify their incursions into lives of the colonized as a moral duty of the naturally superior white men to educate the child-like ignorant natives inculcating European values and culture. The colonizers either were unaware of or simply dismissed the indigenous ways of educating the youth in the colonies and considered the local cultures inferior.

Neocolonialism: the goal of economic hegemony continues

After WWII, the European colonizing nations began to grant independence to their former colonies. New fledgling nations gained political independence but were bound by economic ties still controlled by the colonizing powers. In this way, Neocolonialism took the place of the former colonialism. In Africa, at an All African People's Conference (AAPC), the term "Neocolonialism" was first defined in the "1961 Resolution on Neocolonialism". As Afisi (2010) explains, "[Neocolonialism] was described as the deliberate and continued survival of the colonial system in independent African states, by turning these states into victims of political, mental, economic, social, military and technical forms of domination carried out through indirect and subtle means that did not include direct violence" (Afisi, <https://iep.utm.edu/neocolon/>) The same could be said for the former colonies in Asia.

It was Kwame Nkrumah who used the term in his 1963 preamble of the Organization of African States (OAU) Charter and later, as the title of his 1965 book, *Neo-Colonialism, the Last Stage of Imperialism*. (cited in Afisi, 2010).

In his 1965 book, Nkrumah states:

The neo-colonialism of today represents imperialism in its final and perhaps its most dangerous stage

The essence of neo-colonialism is that the State which is subject to it is, in theory, independent and has all the outward trappings of international sovereignty. In reality, its economic system and thus its political policy is directed from outside.

(Nkrumah, 1965).

Others have used the term neo-colonialism to decry the continued imperialism of European powers even after independence to former colonies had been granted. Jean-Paul Sartre, for example in *Colonialism and Neocolonialism* (1964), criticized France for its continued influence in the governments and policies of its ex-colonies, particularly Algeria and called for their emancipation from French interference.

It was largely through economic pressure that former colonial powers retained control over former colonies. In many ways nothing had changed and the practice of mercantilism continued.

To illustrate the similarity of neo-colonial practices to the former mercantile ones, Nkrumah explains:

.... Neo-colonialist control is exercised through economic or monetary means. The neo-colonial State may be obliged to take the manufactured products of the imperialist power to the exclusion of competing products from elsewhere. Control over government policy in the neo-colonial State may be secured by payments towards the cost of running the State, by the provision of civil servants in positions where they can dictate policy, and by monetary control over foreign exchange through the imposition of a banking system controlled by the imperial power.

(Nkrumah, 1965, p. 3).

He also points out that the control may actually be exercised not by the former colonizing states but rather by consortia of financial interests. As will be discussed below, the influence of such organizations as the World Bank and International Monetary Fund with their headquarters in Washington, DC and the World Trade Organization, head office in Geneva, Switzerland are the powers today that drive the neo-colonial project. In addition, growing world powers like China are also exerting their neocolonial influence in previously colonized nations in Africa. Hence, under neo-colonialism, rather than having colonized states subject to their European mother states, the former colonies are now controlled by powerful economic interests whether they be the large global financial powers like the USA and China, or the financial organizations like the World Bank, International Monetary Fund, World Trade Organization or Southeast Asian Bank, or transnational corporations. These powerful states and organizations continue their imperialist agenda through development aid provided to ex-colonies with conditionalities that undermine the political and cultural organisms of the developing countries (See [Serequeberhan, 1998](#)). In recent years many have questioned the actual benefit of aid to African countries and find it often to have been a pernicious element that has destroyed the indigenous education, local cultures and economies, and plunged the nations into extreme poverty ([Easterly, 2006](#); [Easterly and Williamson, 2011](#); [Geo-Jaja and Majhanovich, 2017](#)).

In the 1980s when much of the world was in economic crisis, many former colony states, particularly in Africa were in grave need of financial support. The World Bank and International Monetary Fund stepped up to provide financial backing but saw the opportunity to reform the economies of the developing countries to bring them into line with neo-liberal economic policies. The Structural Adjustment Programs (SAPs) they developed required that in order to secure a loan, the debtor countries would have to accept certain economic reforms to bring their countries into line with free-market systems. The conditions of the loan included some combination of the following features:

- Devaluation of the local currency to reduce balance of payment deficits;
- Reduction of public sector employment, and other spending to reduce budget deficits;
- Privatization of state-owned enterprises and deregulation of state-controlled industries;
- Deregulation in order to attract foreign investment;
- Closing tax loopholes; improve tax collection. ([Halton, 2020](#))

Although neoliberal adherents of such policies saw such adjustments as a means to make the developing countries self-sufficient, there were severe criticisms of SAPs. African critics have seen these economic adjustments as nothing less than a tool of neocolonialism whereby the poor countries are left at the mercy of exploitative investment by multinational corporations. The impoverished developing nations experience increased dependency on the richer nations and international monetary organizations while falling into ever deepening poverty (See [Global Issues, 1998](#) www.globalissues.org/article/3/structural-adjustments-a-major-cause-of-poverty). Although the WB and IMF did recognize that SAPs were not working and were in fact deleterious to the nations they were supposed to be helping, their replacement program called The Poverty Reduction Strategy Papers (PRSP) did not solve the problems and, indeed, exacerbated them through the continued imposition of conditionalities:

The PRSP process is simply delivering repackaged structural adjustment (SAPs). It is not delivering poverty-focused development plans and it has failed to involve civil society and parliamentarians in economic policy discussions. (*PRSPs just PR say civil society groups, Bretton Woods Project Update # 23, June/July 2001*, cited in [Global Issues](#) article on Structural Adjustment, 1998).

Countries that have experienced the deleterious effects of SAPs include Algeria, Benin, Bolivia, Ecuador, India, Niger, Nigeria, Pakistan, Russia, Sudan, Uganda and Venezuela among others ([Global Issues, 1998](#)). Apparently, India leads the world with the number of SAPs arranged. We note that the majority of the countries negatively affected by SAPs are former colonies. The fact that there are also non-former colonies confirms that neocolonialism now extends beyond the formerly colonized world.

The problem of policy rhetoric versus hard reality regarding the effect of SAPs has been well documented, particularly for Africa (See [Geo-Jaja and Magnum, 2001, 2003](#); [Geo-Jaja, 2004](#)). [Abdi \(2013\)](#) has written at length on the effect of SAPs on Africa:

One can look at what SAPs have achieved for Africa in the past 30 or so years, and from any pragmatic perspective, the picture is anything but encouraging. So much so that one might not help but assume the intentions of the IFI's (International Financial Institutions) were never formulated to fulfil their rhetorical representations. Indeed, the very nature of SAPs i.e., what they are at their core, is not compatible with the basic structures and

practices of African life. At their core, SAPs are one important part of globalization, but at a sub-level, they are to fulfill the requirements of the dominant neo-liberal political and economic agenda where the practices of supply side economics in which in the context of non-interventionalist and unregulated market driven relationships, supply creates its own demand (p.354).

Modern globalization has facilitated the growth of neo-colonialism. Indeed, some equate globalization with the new form of neocolonialism (Mazrui, 2002). As Michael Maduagwu has asserted “globalization is only the latest stage of European economic and cultural domination of the rest of the world which started with colonialism, went through imperialism and has now arrived at the globalization stage” (Maduagwu, 1999, p. 65). As Grainger (2017) comments, intuitively one might think positively about modern globalization in the way links have been developed across the planet, and travel, trade and information exchange have all been facilitated. However, easier access has also facilitated corporate power grabs by transnational companies resulting in an extreme rise in wealth inequality. Modern globalization favors economic liberalism but not for all. Bourdieu (2001), cited in Phillipson, 2006 warned of the hegemonic effects of globalization when he stated:

“Globalization” serves as a password, a watchword while in effect, it is the legitimacy mask of a policy aiming to universalize particular interests, and the particular tradition of the economically and politically dominant powers, above all the United States, and to extend to the entire world the economic and cultural model that favours these powers most, while simultaneously presenting it as a norm, a requirement (p.84/Phillipson, p. 352).

A particularly pernicious element of modern globalization is that the colonized countries under neo-colonialism do accept the imposed inequality as a norm. Perhaps they have no choice but to accept what the dominant powers are proposing. Thus, they have willingly entered into the programs of the developed North that have undermined their ability for development, have left them heavily indebted and impoverished with their indigenous culture and languages threatened. The operations and heritage of European colonialism that we experience today has been termed by Quijano as the “Coloniality of Power”. He writes, “Europe’s hegemony over the model of global power concentrated all forms of the control of subjectivity, culture, and especially knowledge and the production of knowledge under its hegemony” (Quijano, 2000). As such the racial, political, economic, cultural, and linguistic orders of the colonized are considered inferior, and certainly of lower value to that of the colonizing powers, European and American (See Quijano, 2007).

Education as part of the colonialist imperialist project

In colonial times, schools in the image of their European counterparts were set up. The issue of education in colonial India provides a salient example. Thomas B. Macaulay’s “Minute Upon Indian Education” of February 2, 1835 argued for English as the medium of instruction in all schooling taught by trained Indian English-speaking teachers. The goal was “to form a class who may be interpreters between us and the millions whom we govern,—a class of persons Indian in blood and color, but English in tastes, in opinions, in morals and in intellect” (Macaulay, Minute, Section 34, 1835). Despite some opposition, Macaulay’s arguments prevailed with the result that traditional Indian education, vocational and science education were eliminated. To this day the medium of instruction in Indian schools is English. Macaulay reflected the racist beliefs of the imperialists of his times declaring for the supremacy of English (or other European languages) over the vastly inferior languages of the colonized “barbarians”, and the intrinsic superiority of European literature and culture. As smugly stated in the “Minute”, “a single shelf of a good European library [is] worth the whole native literature of India and Arabia” (Section 10, Minute, 1835).

It is clear that the goal was not really to educate and enlighten the colonized population but rather to prepare intermediaries among them who would prepare the locals for the menial jobs needed to sustain the economic endeavors of the ruling class.

In addition, colonial education often had the effect of at best undermining, at worst destroying local cultures and languages. One of the most egregious examples comes from the residential school system set up in Canada in 1883 to “solve the Indian problem” through the education of indigenous children. In reality, policy makers sought to assimilate indigenous people through the eradication of cultural (and by extension linguistic), spiritual and economic foundations of First Nation societies (Hill, 2004). There is incontrovertible evidence of the devastation visited upon indigenous peoples in North America including “loss of language, grade retardation, high dropout rates, rampant physical, sexual and emotional abuse, alienation and intergenerational communication breakdown” reported in extensive research (Binda and Lall, 2013, p. 16; see also Aboriginal Healing Foundation, 2009, Canadian Council on Learning, 2007; Royal Commission on Aboriginal Peoples, 1996; Assembly of First Nations, 1994).

Generations of native children were forcibly removed from their parents and transported to far off residential schools where they were educated in the ways of the dominant culture and were severely punished if they dared to speak their native language or practice cultural rituals. For much of the time when residential schools existed, it was various religious orders that ran the institutions, inflicting the most severe disciplinary practices against the helpless children when they strayed from the rigid code of behavior. The children were often malnourished, physically abused, received minimal medical care, and many died. Eventually the government took control of the schools from the orders after becoming aware of the atrocities committed. However, this

system continued operating for over a century still dedicated to assimilation of the native children, still forbidding the use of the indigenous languages and cultural customs. The last residential school in Canada only closed in 1996. The abuse and indignity that the children suffered in these schools has left an indelible mark on them and their descendants. Only recently has the Canadian government begun to address the wrongs perpetrated on the native people through the residential school system. The recent discovery of hundreds of unmarked graves of indigenous children on the sites of former residential school provides a powerful and sobering reminder of the violence perpetrated under the colonial imperialist project to assimilate/eliminate the indigenous populace (See [Aljazeera, 2021](#)). The Canadian Truth and Reconciliation Commission, modeled on the commission set up in South Africa to address the outcomes of the Apartheid system, was set up in 2007 and over the following 6 years traveled all over Canada and took depositions from 6500 witnesses. In 2015 the final report was tabled, with 94 “calls to action” which focused on language and cultural issues ([Government of Canada, 2019](#)). It is noteworthy that the Apartheid system apparently was based on the residential school system in Canada ([Engler, 2013](#)). In any case, these systems reflect colonialist goals of suppressing the colonized and assimilating them to European customs, and values to the detriment of local cultural, spiritual and economic foundations.

Neo-colonialism and education

It is generally accepted that education provides the mechanism whereby people can reach their full potential to take a functional place in society. However, when the formal schooling such as that imposed on formerly colonized nations and their disadvantaged populace serves to inculcate the values and culture of dominant powers to the exclusion, suppression or degradation of local ways of knowing and learning, then the recipients of this form of schooling are badly served. Several problems arise when those organizing the educational systems choose to ignore or disparage indigenous educational practices.

Indeed, many have argued that systems of modern western education with its origins in 16th Century Europe, instead of providing a liberating force of enlightenment have actually served to secure an imperial or colonial world system whereby the values of the European world are privileged over all others and the people of the subject states are inculcated into these understandings of the world, eschewing their native ways of knowing.

As [Baker \(2009\)](#) has argued,

Contrary to the deeply held nationalist assumptions and benevolent liberal intentions among contemporary educators, administrators and policy makers, modern western education systems are part of an imperial/colonial world historical system. State schooling reproduces the dominant social imaginary reflected in the geoculture of the modern/colonial world system. Schooling practices are largely constituted by western knowledges and Eurocentric assumptive worldviews that systemically maintain hierarchical, unequal and violent (symbolic and material) global power/knowledge relations. Through the incorporation and stratification of individuals within particular ethno-cultural intersubjective structures of knowledge and understanding characterized broadly as Eurocentrism, schooling reproduces the modern/colonial world system. State educational institutions are part of a systemic civilizational apparatus in the ongoing redemptive mission of western expansion and domination (pp. 52–53).

The imposition of a European schooling system upon first the colonies, and later former colonial states and developing nations has not had a positive result. To begin with, much of the subject matter imported directly from the European contexts is not at all relevant to the learners. Readers containing stories about European Christian holidays and other activities and pastimes, typical for Europeans or Americans, for example, mean little to children who do not belong to that religious faith nor are aware of the climate and culture and values of the developed North. Moreover, often the curriculum offered has been designed to train only a small percentage of the locals as future elites who would serve as intermediaries between the colonial/global masters and the locals who would only be prepared as unskilled laborers. Since the schooling provided was inevitably in a colonial, European language with little chance of learning in the only language most children understood, namely, their local language, it was ensured that most would never be able to complete the program offered and dropouts would be rampant. It is after all difficult if not impossible to learn concepts when being taught in a language one does not understand (See [Babaci-Wilhite et al., 2012](#); [Majhanovich, 2013](#)).

How global languages and European education systems support colonialist hegemony

There have been years of research that demonstrate that success in schooling is linked to being taught in one’s home language. Some who have focused on the issue in the African context include [Babaci-Wilhite \(2013\)](#); [Benson \(2008\)](#); [Bjork Holmarsdottir \(2009\)](#); [Brock-Utne \(2005, 2007a, 2007b\)](#); [Kimizi \(2009\)](#); [Mbekwa and Nomlomo \(2013\)](#); [Prah and Brock-Utne \(2009\)](#). Similarly, [Kosonen \(2005, 2013\)](#) working in the South East Asian context has argued for the importance of providing particularly primary education in the native language. The issue is not the total removal of English and replacement with local languages; rather it is recommended that early education be taught through the medium of the local languages and English be introduced later, taught as a subject, so that the children can use it in communication and possibly when entering the working world where the global language English is the main medium of communication. However, the prevailing trend continues to privilege European languages

for schooling, particularly English, knowledge of which is viewed as a highly valued commodity. As Pennycook has articulated so well, English being inextricably bound to social, political, economic and cultural contexts worldwide, is part of a power dynamics that reflects the neocolonial world of today. As a result of this, the colonized actually have no choice but to learn English in order to participate in the workings of the modern world (Pennycook, 1998, 2017).

The argument is made that being schooled in English will result in competence in the language and will provide a ticket to a highly paid job in the global market. Despite evidence to the contrary, local parents believe that education in the European languages is preferable to learning in a language their children understand. European-style education, they believe, will help to pull them out of poverty and advance in the globalized world. That this is not the case has been widely demonstrated (see Geo-Jaja, 2013; Mignolo, 2007; Mignolo and Tlostanova, 2007 among many others). Those from the WB who promote European-style education for their client states in the developing world apparently believe that European style education for developing countries is the way out of poverty as well. Accepting education packages published in the developed North were often requirements in the structural adjustment packages negotiated as conditions of much needed financial loans to developing countries. A cynical interpretation might see these educational provisions as a basis for ensuring the continuation of the modern neocolonial condition and perpetuating the inequalities that inevitably result when local cultures, languages and ways of knowing are rejected and in some cases destroyed.

One is struck by the arrogant assumptions of those who impose Western style education on developing areas and are not in the least interested in the opinions and indeed experience of the receivers of this “largesse”. The assumptions about education as it is understood in the developed North and West as the only possibility, all others being inferior or non-existent appear in reports from the OECD and do not apply only to formerly colonized regions. Silova, Millei and Piattoeva, in a recent article entitled “Interrupting the Coloniality of Knowledge Production in Comparative Education: Post-Socialist and Post-Colonial Dialogs after the Cold War” (2021) detail how they as experienced and qualified educational researchers working in post-Soviet countries on curriculum and educational reform routinely had their well-founded, knowledge-based findings dismissed by Western “experts”. Silova et al. quote from OECD reports showing general lack of confidence in the ability of local educators to produce meaningful reform in education claiming that locals were unable to produce meaningful educational research that could lead to educational transformation (p. 9). They as western-trained scholars and educators with first-hand experience in the post-Soviet countries were deemed incompetent because they had different ideas about how to reform and improve education. Silova et al. (2021) comment that the coloniality of the OECD reports is striking. Neocolonialism is alive and thriving all around the world.

The power of language in the neocolonial project

Language is the carrier of culture and values. When educational systems all over the world are offered in one of the prominent European languages, primarily in English but also in French or Spanish, it is inevitable that the values, ways of knowing and perceiving the world as well as the ideologies of the countries of these powerful languages are transmitted to the students (Pennycook, 2017). English holds a particularly privileged position in this regard. The Medium of instruction for elementary and secondary education in especially the formerly British colonized world is commonly English. As Brock-Utne (2013) comments, “no secondary school in Africa has an African language as the language of instruction” (p. 77). Majhanovich (2014) has outlined the proliferation of English education in countries in Africa and the Asia-Pacific region observing that both former colonies of Britain as well as countries that were never British colonies have embraced English education especially at the post-secondary level. She points out the importance accorded to English education particularly in the areas of Business, Science and Technology, and Medicine. Many universities in English speaking nations, especially the US, Australia and the UK, but also to a lesser extent Canada have set up off-shore campuses in Asia and elsewhere to offer these programs with implicit neo-liberal and market-oriented content. However, a large number of the universities in Japan, South Korea, Cambodia, Taiwan and China offer parts of their program in English. In China, for example, the value of knowing English is accepted. English is part of China’s “Four Modernizations” program which has focused on modernizing agriculture, industry, national defense and science and technology along with the promotion of English teaching throughout the country. Instruction in English begins in the third grade; students in secondary school have to work through nine proficiency levels of English finally passing a College English Test to secure entrance to university. Even in University, students may take up to 10% of their credits in English (Feng, 2009). In former colonies such as Hong Kong, Malaysia or Singapore, there is even more evidence of English throughout the educational levels (See Majhanovich, 2014).

Of the powerful European languages, English has emerged as the favored tongue and is often referred to as the *lingua franca* of the world as it is the language most commonly used in cross-cultural or inter-community communication (See for example Hülbauer et al., 2008 or Phillipson, 1992 on Linguistic Imperialism). English is spoken as a first or learned language by more people around the world than any other language. We should not overlook in this regard, the notion of world Englishes as proposed by Kachru (1985). His three concentric circles model depicts first the inner circle for countries such as the UK, USA, Australia, New Zealand and Canada where English is the primary language; the outer/middle circle which includes countries which are former British colonies and where English can be considered as a second language, and the expanding circle for countries like China and Russia with no colonial connection to the UK but where English as a foreign language is spoken in the world business context. Kachru’s model aptly depicts the hegemonic power of English and its connection to the modern neocolonial reality. It goes without saying that those countries in the inner circle enjoy a certain advantage when advancing their political and economic agenda.

The power of the English language is demonstrated not only through its connections to economic and political transactions, it also by necessity is embedded in educational systems globally. It is the language of the academe: as mentioned above, many tertiary level education programs, especially in Business, Science and Technology, and Medicine are offered in English in the top universities globally. The top tiered journals, ranked on international indexes publish primarily in English. Even the UNESCO based Journal, *The International Journal of Education* which publishes abstracts in English, French, German, Spanish and Russian publishes these days almost exclusively in English. At International Conferences, the language of communication is almost always English perhaps with handout summaries provided in the language of the country where the conference is being held. Having to write and present academic research in English presents unfair challenges to those from Kachru's expanding circle (Kachru, 1985), non-English academics and researchers who must learn to write according to norms of Standard English, norms which are often alien to the researchers' culture and methodological practices. It is not surprising that many have objected to the inequitable situation that non-English academics must face. Flowerdew (2007) calls it plainly inequality; Parijs (2007) clearly resents the "free ride" that English speaking researchers are given when it comes to publishing their findings. Yukio Tsuda (1997) laments the many negative consequences for academics as a result of English dominance, namely:

- (1) Linguistic inequality to a great disadvantage of the speakers of languages other than English;
- (2) Discrimination against the non-English speaking people and those who are not proficient in English; and
- (3) Colonization of the consciousness of and identification with the English, its culture and people (Tsuda, 1997, p. 22).

Tsuda has recognized the key role of the English language in the continued colonization (or neo-colonization) of the globe. It is necessary to learn and be proficient in English in order to succeed in academia today, but in so doing one comes to accept the values conveyed through the language and begins to identify with them, thus, becoming colonized by and subject to all that the English-speaking world represents.

Global English supports and promotes neoliberalism

The mission statements of universities, but also policies related to elementary and secondary education are imbued with neo-liberal slogans. The English language has become commodified according to linguists like Heller (2010). She has examined the discourses used in educational and fiscal policies and finds evidence of neoliberalism threaded through them. Whereas traditionally education was engaged in to achieve enlightenment and intellectual growth, now it is a commodity to be bought, its outcomes to prepare one as a member of the global market. Abelman et al. (2009), cited in Pillar and Cho, 2013, p. 30 comment on student identity today in a neoliberal world, noting, "the new model student is an autonomous student-consumer who is responsible for managing his or her own lifelong creative capital development" (p. 232). As early as secondary school, students are encouraged to prepare a "business" plan where they list the courses they will take to prepare themselves to participate in the global market. Economic new-speak has colonized policy making across governments. Holborow (2006) cites Hasan (2003) where she comments on how the English language has been affected under the neoliberal agenda:

She talks of "glibspeak" [which] consists of turning the semantics of ordinary English upside down and globalizing new concepts which are friendly to the ideology of capitalism ... she observes that political words such as *equality*, *freedom*, *liberalization*, and *non-discrimination* are redolent with ideological shifts. She also charts the process of "re-semantization" by drawing attention to the ideological meanings which have attached to *globalization* only recently—like "lower costs of production", "international expansion of companies" and appropriate take-overs

(Hasan, 2003, p. 437 cited in Holborow, 2006 p. 90).

In this way we can see how the English language is a co-opted partner in the neoliberal/neocolonial globalization project.

English dominance and hegemony are reflected everywhere in the globalized world. Indeed, Majhanovich (2013) has argued that the English language as the *de facto lingua franca* of the world contributes vastly to sustaining the neoliberal/neocolonial agenda. English is the working language of a majority of global organizations. It is interesting that the European Union, although recognizing 24 official languages typically works in English, French and German with two-thirds of the policy drafts in English. Its motto "One Europe" is in English only (Phillipson, 2003, 2006). Now that the UK has withdrawn from the European Union, there has been talk of changing the main working language to something else, perhaps Latin, but most wish to continue using English as the most convenient language understood by the majority. The working language of such organizations as the World Bank, World Trade Organization, and the Association of South East Asian Nations is English. These organizations promote privatization, deregulation, decentralization, and *laissez-faire* economic policies, all facets of the neo-liberal agenda that sees market-oriented policies as the operating principles of the globalized world. In order to succeed and compete in the global market, countries have to embrace the tenets of neo-liberalism as expressed by the powerful English-speaking nations of the world. In this way then, the powerful European languages, and especially English, contribute to the continuation of neocolonialism around the globe.

Final thoughts and summary

In this paper the rise of European imperialism and colonialization was reviewed, showing their connection to economic hegemony. Neocolonialism as defined by Nkrumah in 1965 continued the goals of colonialism, especially those related to economic control by world powers and transnational institutions of former colonies and developing nations. It is a violent history where those in power have not hesitated to sacrifice the colonized, their cultures and languages in the goal of imposing European standards and practices to ensure profit and economic dominance.

Education for the colonies as funded by the former imperialist powers played a large role in the colonialist project and this has continued in the neocolonial age. One cannot underestimate the role of global languages, particularly English, in supporting and promoting the particular neoliberal *Weltanschauung* prevalent today. Indeed, policy documents reflect the way that the English language is used to promote the neoliberal agenda, forcing all areas of society to conform to its goals.

What response can be mounted to counteract neocolonialism that is so pervasive and has resulted in so much inequality and disparity of wealth worldwide? Clearly, every attempt at decolonization must be undertaken to work on tearing down the structures of colonization that continue to prevail. Alternative collective approaches similar to those used by indigenous societies could be entertained. Efforts to honor and resuscitate indigenous languages and cultures should be undertaken. Policies that work to sustain the neoliberal market agenda should be carefully examined and revised to eliminate the inherent injustices they promote. Finally, we need to be sensitive to the way the English language is evolving to serve as the handmaiden of the globalizing world powers.

Introduction

The recent ransomware attack on Colonial Pipeline, the largest petroleum pipeline in the US, by cyber criminals acting on their own or as agents of a hostile government, illustrates the complexity of contemporary geopolitics. Wars can now almost be waged by a handful of actors attacking private companies, acting alone or on behalf of governments, by crippling critical infrastructures. Cambridge Analytica’s interferences in the 2016 elections in the US had already demonstrated how easily national and international politics can be interfered with, in a significant way and with enormous consequences, by distant private actors whose actions may go unnoticed for a considerable time. Amassing wealth and a nuclear arsenal does not provide any protection against such actions. The display of tanks and missiles and other weapons in parades to commemorate key national celebrations make little sense in these times. Power can no longer be assumed to be held by any nation in any stable and sustained way—power can now be assembled in small scatterings almost anywhere through new forms of action by unknown and invisible actors. A Cambridge Analytica or a Facebook can flex its muscles to create ripples anonymously across the world without visible bloodshed.

In another bizarre turn, as the world struggled with COVID, vaccine shortages and severe economic hardships for many, a couple of billionaires breached another boundary—the earth’s atmosphere—to have a joyride in space. Another arena that was once exclusively the purview of governments and a matter of national pride is now a competition between private individuals. The concentration of wealth in the hands of a few players has had an incredible influence on geopolitics. Commentators have wryly noted how easy it is for Bill Gates to commandeer a meeting with any head of state and to divert massive funds toward his pet projects at the expense of the priorities of international aid organizations. In the process, national priorities and agendas end up being reformulated. Private actors also became involved in the evacuation of Afghanis and foreign nationals from Taliban-held Afghanistan to fill the deficit in the efforts of the most powerful nation on earth. The lines between state and non-state actors are increasingly blurred, and it is becoming harder to identify those capable of mobilizing harm, challenging national and international regulations and rendering even the most powerful nations vulnerable in new ways.

In a completely different way, the COVID-19 pandemic has also tested the extent and limits of sovereignty. While the virus has utterly disregarded national boundaries and traveled freely and promiscuously, it is shutting borders to human travelers. The global shortage of the vaccine has once again disadvantaged the poorest nations, and yet it is clear that no country can be safe until most of the world is vaccinated. Even mighty economies have not been immune to the destructive power of this invisible menace.

The pandemic is linked to another significant contemporary issue—climate change—an imminent existential threat which is already literally redefining geographies. To begin with, the climate crisis is planetwide—and it requires cooperation among nations, rather than competition and warmongering. Economic might, so central to global geopolitics, now has to be reconsidered as a goal, since flooding the planet with more goods that it requires comes with a climate price tag, including actual flooding and other disasters (and the danger of becoming a global pariah). Climate change has summoned nations around the world to a series of summits and induced various agreements and commitments. The crisis has reorganized the list of “good” and “bad” nations not only in terms of their human rights records etc., but also in terms of their contribution to global warming. Most recent reports signal we are past the point of no return and that the destruction and havoc we have wreaked is now impossible to reverse. If humans exercised their agency wantonly in destroying the planet, cutting down forests and filling the atmosphere with harmful emissions, nature is reasserting its agency.

The rise of big data and algorithmic decision-making has further complexified an already very complex scenario, where structures of power and the ways in which agency is allocated or appropriated are no longer clear or predictable. Structural and infrastructural tropes—organization “trees” to denote the structures of power and responsibility, for example—are giving way to more complex

maps of widespread, shifting, networks. The distributed nature of action challenges ideas of hegemonic power amassed at traditional centers of power (Gorur, 2019).

At the same time, technological tools—particularly social media, big data tools and AI-enabled technologies—have magnified the reach of otherwise unremarkable actors—as a result, not only have actors proliferated, they are also very diverse—ranging from individuals to distributed and “headless” groups, to intelligence communities of nations acting behind the scenes to machines learning as they go. The (apparently) abundant and free knowledge available to us is no antidote since our access to information is, increasingly, being mediated by algorithms designed by faceless individuals for commercial or political gain. A few clicks, “likes” and downloads configure the contours of the world we come to know. Again, nowhere is this more poignantly evident than with Cambridge Analytica’s manipulation of information streams via Facebook, or the hold of conspiracy theories that is drawing in not just the fringe elements, but, increasingly, mainstream society. At the same time, the technologies powering an uberized economy are extractive and exploitative—capitalizing on the unsuspecting labor of consumers who give up their data with little knowledge or persuasion, as well as an army of highly regulated individuals employed under intolerable conditions (Crawford, 2019).

These rearrangements are upending the established geopolitical order, heightening a sense of unpredictability, uncertainty and vulnerability and creating intolerable inequities and anxieties. The comfortable projections of econometricians, pollsters and intelligence officials are now less reliable with national economies and politics impacted by distant and unexpected actors and phenomena. Intergovernmental organizations such as the WHO and the UN have been rendered less effective in maintaining moral and practical sway over nations, thanks largely to Trump’s white anting of these agencies, and institutions that held for over 200 years, providing a sense of stability, have demonstrated that they, too, are vulnerable.

Contemporary geopolitics makes compellingly obvious the key roles played by nature and technology in the ordering of societies. Any attempt to examine and theorize geopolitics today must therefore take seriously the agency of these non-human actants. But the acknowledgment of the agency and power of non-human elements such as technology and nature poses a huge challenge for social theory, which, since enlightenment, has been predominantly human-centric. Privilege, interest and intention no longer suffice as explanations. Nor do sweeping theories such as neoliberalism. It is not that old and recognizable structures of hierarchy and power have disappeared. Rather, simultaneously, we now have, alongside the established structures, novel, agile, light and unpredictable ways in which power is mobilized. To properly account for the increasingly critical role of non-human entities in contemporary geopolitics, we require post-humanist theories.

The next section provides a brief overview of posthumanism and following that, we explore how contemporary geopolitics are materializing in education contexts, and how posthumanist theories, particularly STS, might be usefully deployed in studying contemporary education phenomena.

Posthumanism—a Copernican revolution

Decentering the human in contemporary social theory is no less a revolution than Copernicus had provoked six centuries ago, decentering the earth with his heliocentric model of the universe. “Posthumanist” theories, broadly speaking, seek to accommodate the undeniable participation of non-human actors such as technology and nature, and the new modes of exercising power in more-than-human societies. Rosi Braidotti, one of the leading scholars of posthumanism, argues that we are now witnessing a convergence of two major movements—posthumanism, which rejects “the humanist ideal of ‘Man’ as the allegedly universal measure of all things,” and post-anthropocentrism, “which rejects species hierarchy and human exceptionalism” (Braidotti, 2019, p. 32). The project of posthumanism is a political one. It is committed to empirical descriptions that recognize the polycentric and immanent assemblages that produce social phenomena. In this way, Braidotti argues, critical posthumanism provides critical as well as productive ways to study the “posthuman era” which she describes as a combination of the Anthropocene, technological advances and the social and economic inequities that characterize the current moment.

Old geopolitical orders function on an explicitly humanist politics premised on human exceptionalism that highlight the moral supremacy and agency of humans. They restored control over human life to rational human thought and action, in a reaction to the religious authoritarianism and the superstition that marked Medieval Europe. Humans were differentiated from other animals and organisms based on their consciousness, their capacity for benevolence, their language, and so on. Humans were seen as a rational, agentic individuals (Nayar, 2013).

However, this modernistic notion of “pure” and unambiguous human individuals has always been a fiction, as Latour (1993) has argued. Nayar (2013) provides a series of examples from texts by authors such as Ursula Le Guin, Octavia Butler, Kazuo Ishiguro and Marge Piercy, as well as movies such as the Terminator films and Gattaca, where the boundaries of “So-called ‘normal’, self-contained and sovereign humans” that have “specific biological features and abilities, sex, form and functions” is severely troubled. At the same time, he notes that animal-human assemblages abound in fables—from animals that exhibit human capacities to humans that turn into werewolves and so on. These presentations force a reconsideration of the fiction that has come to be defined and essentialized as a “normal” human—and to question the “particular physiology, anatomy, intellectual ability and consciousness” that has come to mark “normalcy” (Nayar, 2013, p. 11). Moreover, stem-cell engineering, cloning, artificial intelligence (AI) and other technologies have translated these fictional hybridities into real life, although, even without these interventions, various forms of microbes colonize our bodies, and the human body is thus already a hybrid assemblage.

The construction of what constitutes a “normal” human comes with repercussions for those cast outside that norm. So, troubling the boundaries of “normal humans” is a political project. Women have historically been left out in considerations of the human in

many societies, seen as lacking in intellect, agency, and so on, as well as “prisoners, comatose patients and asylum inmates, along with ethnic/linguistic/religious minorities, differently abled and developmentally challenged people” and inter- and trans-gender individuals. Particular definitions of “normal humans” provides license to treat those outside these norms as “less than human” (Nayar, 2013).

Posthumanism decenters the placement of humans above other life forms, and at the same time rejects the view of humans as autonomous and fully defined individuals. Instead, it treats “the human itself as an assemblage, co-evolving with other forms of life, enmeshed with the environment and technology” (Nayar, 2013, p. 13). This creates fundamental shifts in how society—and with it, contemporary geopolitics—is understood.

Critical posthumanism may be regarded as emerging from a range of what Braidotti (2019) refers to as interdisciplinary “studies” which are often marginalized in contemporary cognitive capitalism—gender studies, queer studies, postcolonial studies and science and technology studies (STS). With the explicit politics of troubling binaries such as nature/culture and human/non-human, post-humanist approaches are well suited to the study of new geopolitics, highlighting issues related to the inequities that arise from humanistic normativities, and taking into account the work and agency of non-humans such as nature and technology.

STS is one of many posthumanistic approaches. Originating in the 1970s, and inspired by Kuhn, STS scholars began to study science as a social practice, as well as the impact of science and technology on society. Studies of laboratory science (e.g., Latour, 1987; Latour and Woolgar, 1979) and of epistemic practices (Knorr-Cetina, 1999), for example, focused on how objectivity and rationality are fabricated through a series of material-semiotic practices.

The second “S” in STS is sometimes used to denote “society,” and STS has also engaged in the studies of how social orders are produced, and in the working of politics and governance. The rationality, objectivity, individualism, universalism, accountability and so on associated with liberalism are also challenged by STS scholars. Although STS has made a relatively recent entry into education, there is a growing body of scholarship in the field (Gorur et al., 2019). In the next section, we provide brief understandings of how STS contributes to education policy research within contemporary geopolitics.

Education, the new geopolitics and posthumanism

As a key technology for maintaining social order, education has been a site of interest for the global community, particularly since the post-war period of reconstruction and following the independence of many colonized nations in the 1960s. Ensuring that all children have access to education has been considered a moral imperative. Since education is key to securing jobs and gaining access to a better quality of life, not having access to such education results in poverty and leads to inequities and discontent in society—potentially a threat to global security. Intergovernmental organizations such as UNESCO, the World Bank and UNICEF have invested in mapping and measuring literacy and numeracy across the globe for several decades. Major global reform plans such as Education for All, the Millennium Development Goals and the Sustainable Development Goals (SDGs) have brought different nations into relations of obligation and accountability to the global community. Low- and middle-income nations have been sites of intervention for the global community for decades. International funding has often come with strings attached in the form of new accountability measures to be adopted. In recent decades, there have been attempts to recast the hierarchical relations between the donors and the recipient nations, with a stress on the harmonization of goals and a participatory partnership in which nations are not merely “done to” but actively support international agencies in developing an agreed agenda and ensuring they develop the capacity to achieve the agreed goals (Gorur and Addey, 2021). These changing relations are one aspect of contemporary geopolitics in education.

In education, too, there has been a huge proliferation in the number and range of actors—particularly non-state actors. NGOs and INGOs abound in low-income nations, intervening in a number of ways—directly supporting teaching in classrooms, developing curricular resources, providing equipment such as sports materials or computers, supporting teacher education, providing scholarships and so on. There are also a range of organizations training parents to engage in school management committees, advocating for particular changes (such as education in the mother tongue), encouraging parents to send girls to school, setting up programs to prevent students dropping out and so on. These organizations also hold events to raise funds and awareness for their programs, often targeting the same group of citizens. In countries like Cambodia which have a strong presence of aid agencies and over 2000 NGOs as well as national donors and INGOs, development partners aligned their programs and efforts through monthly Education Sector Working Groups led by UNESCO and UNICEF. Boundaries between national and international, and state and non-state actors and activities begin to become fuzzy in these efforts to harmonize and coordinate efforts.

The phenomenon of global actors interacting and influencing national policies is not limited to low- and middle-income nations. The SDGs are a commitment made by almost all the nations of the world, and there is a voluntary submission to UNESCO’s requirements of transparency and accountability by all the signatories. Moreover, the OECD has been influencing high-income nations, in particular, with its own metrics, particularly the Program for International Student Assessment (PISA) as well as various forms of analysis and attendant policy advice.

A range of private, for-profit actors are also very active in the education space, acting in variety of arrangements, including as outsourced providers or in partnership with the public sector. Beyond the very substantial presence of private schools and colleges in the education systems of most nations, there are charter schools, voucher systems and other alliances through which the boundaries between “public” and “private” start to blur.

A key feature of education of recent decades has been the massive increase in datafication, as nations have sought to govern education through mechanisms of legibility, transparency, and accountability, at ever-expanding scales and in ever-increasing detail. New and extended infrastructural networks are enabling “intimate accounting” (Asdal, 2011; Gorur, 2016, 2018), whereby the center is no longer a distant entity seeing and steering from a distance, but a much more immediate presence, penetrating institutions such as schools and forcing them to expose their most intimate details on public sites in the name of transparency, as is the case with Australia’s MySchool (Gorur, 2013). The gaze is at once both intimate and disinterested, creating a range of new anxieties that leave institutions constantly scrambling to appear pleasing, compliant and attractive in the face of extreme scrutiny. What is interesting about this intimate accounting is the production of “non-authority” whereby bodies of authority seemingly give up their powers to inspect and regulate, instead relying on institutions to set their own targets and to regulate themselves through public disclosure of their data (Asdal, 2011). This kind of regulation is also evident at a global scale in wake of the declaration of the SDGs in which nations are subjecting themselves to intimate scrutiny through projects of global metrics.

More recently, there has been a steep rise in use of digital technologies in the education space. Following COVID, the use of online teaching has of course become extremely widespread (but by no means universal—the availability of these technologies cannot be taken for granted for a sizable proportion of the population)—but this is only a very small part of the datafication evident in education. Platforms and apps are prolific in every conceivable activity—as we elaborate in the next section.

Finally, nature and climate change are increasingly becoming actors in education. Students have been striking around the world demanding that the adults in charge do a better job of protecting the planet. Meanwhile, questions are being raised not only about whether the curriculum taught currently in schools does enough to create the necessary understandings about sustainability, but whether systems premised on market-based theories of competition are suitable at a time when collectivism rather than individual gain is the need of the hour. Education thus reflects many of the same ripples that are causing turmoil in global geopolitics.

Posthumanism and STS in contemporary education

Some of the key contributions of STS scholars to the study of emerging geopolitics in education are theoretical and empirical accounts of how power is being mobilized and circulated. We provide a flavor of these studies in this section.

Reassembling “context”

A range of studies in education have dealt with the contemporary phenomena of neoliberalism and globalization. But, as Latour (2005) and Callon et al. (2011) have emphasized, for STS scholars, these phenomena are not explanations of other social phenomena, but are themselves what need to be explained. In other words, they are not transcendental phenomena driving all other events, but are assembled and maintained through a range of practices on multiple sites (see also Ong, 2007). By making these phenomena objects of research, STS approaches render them less monolithic, less black boxed, and more amenable to challenge (Law, 2008).

In contemporary education, “context” comes up in two different ways. On the one hand, global reform agendas and efforts to create global comparability demand a consideration of the diversity of contexts—even if only to neutralize it through various technologies of standardization. Large scale standardized assessments, for example, do not entail the same survey being administered all over the world. Rather, the surveys are tailored to local “contexts” so that the variations help create instruments that work in a similar way across varied contexts. At least, this is the effort. “Context” also became a concern for global development organizations from the late 1900s, when they found that many of their high-investment projects, particularly in Africa, simply collapsed once the international team had left the scene. The realization that projects conceptualized elsewhere and plunked into local “contexts” that operate very differently are prone to failure has prompted a great deal of attention to “capacity building” activities that attempt to reshape the context to support such projects, even as projects are seen as adapting to the local contexts (Addey and Gorur, 2020). Indeed, today funding is dependent on recipient nations agreeing to participate in “capacity building,” and the World Bank sets aside a third of its development budget for capacity building activities. What “capacity building” does is essentially engineer the context so that the reform can take root and flourish—it creates the assemblage that holds the reform efforts together. This effort is a kind of “politics by stealth” that appears to recolonize even as it proclaims decolonization (Gorur and Addey, 2021).

Once context is understood not merely as a backdrop within which processes like datafication and standardization are to be “read” (i.e., context as a “container”), and is instead conceptualized as dynamic and co-produced with the phenomenon being studied, the construction of “context” is rendered into something that can be empirically examined in useful ways. This approach also un-black boxes such phenomena as globalization and which are often taken for granted as monolithic categories, and makes it possible to follow the quotidian and mundane practices (Woolgar and Neyland, 2013) through an attention to the empirical that is not preceded by theoretical orthodoxies. While critics of STS contend that this approach diminishes the significance of pre-existing power structures, STS scholars argue that their insistence on immanence and emergence represents a more hopeful and productive politics which moves existing power structures from the realm of the un-displaceable to “matters of concern”—matters that become available for intervention. As Gorur et al. argue:

now, perhaps more than ever before, STS is needed to make sense of, and to respond to, the unique pressures facing the field of education. As we grapple with increasing inequities, growing standardisation and internationalisation, the deprofessionalisation of teachers, the entrenchment of detrimental neoliberal practices of governance and accountability, the erosion of institutions and the increasingly unquestioning trust in numbers (Porter, 1995), STS provides the means for engaging with the ontological politics of these phenomena.

Gorur et al. (2019).

The politics performed by STS is thus different from the conventional “critical sociologies”—it is “politics by other means” (Latour, 1988).

Datafication

Data, and increasingly, big data and algorithmic governance are shaping education policies at the national and global levels. The global south is seeking to embrace AI as a means to “leapfrog” over infrastructural deficits. In India, AI is being deployed for personalized learning, automated career advice, intelligent tutoring, and automated decision making for such consequential decisions as allocating education loans. These developments raise a range of concerns, particularly those related to loss of privacy, fairness and the perpetuation of bias (Chamuah and Ghildiyal, 2020). Moreover, such moves could shift attention from the paucity of the more basic physical and digital infrastructure which continue to vex those at the ground level. Ambitious digital datafication projects in India, for example, are disproportionately burdening teachers and principals who must find workarounds for the lack of electricity or slow internet (Gorur and Dey, 2020).

Digitization and datafication are also linked to privatization. Among the many issues raised by privatization are how it might clash with the notions of equity, the right to education and education as a public good, especially in the global south; and the colonization of the education space by private actors, including global multinational companies, through such technologies as the Google Classroom. In higher education, platformization is combining with more traditional forces of neoliberalism to reshape universities—perhaps in ways—and with effects—that were never properly anticipated or desired, and with downstream consequences that have not yet been fully imagined or realized (Komljenovic, 2020). Williamson (2020), Selwyn (2019) and others have raised serious issues relating not only to such issues as bias and the reproduction and amplification of structural inequities using AI in education, but also the entry of particular psychological, neurological and emotional logics that are built into AI-mediated platforms and apps that are now ever more widely used in schools and universities.

Education in the Anthropocene

Finally, STS scholars in education are now also engaging with the role of education in the Anthropocene (e.g., Silova, 2020). Whereas earlier efforts focused on including environmental education in schools encouraging schools and universities to practice waste reduction etc., some scholars are taking a broader view and demonstrating how the market-orientation of education in neoliberal times—perpetuated through rankings and competition—fosters an individualistic and greedy, consumptive society. They argue that teaching environmental consciousness within a system that encourages consumption is farcical, and seek other ways—such as systems premised on the collective good—as means to reimagine education in the Anthropocene.

Looking ahead

Although STS-informed posthumanist studies are becoming more accepted in education, and the body of work in this area grows everyday, the core commitments of these approaches remain controversial and still encounter some resistance. The analytical symmetry toward human and non-human agency remains a sticking point, and is often taken as a naïve and anthropomorphic approach to the non-human. At the same time, posthumanistic understandings of “humans” (as human-non-human assemblages) are also hotly contested by critics. At the heart of this is the issue of intention. Critical sociologists, in particular, hold a view of power which seeks to hold wrongdoers responsible (Gorur, 2021). They fear that treating humans and non-humans symmetrically will shift intentionality from humans to non-humans, thus letting off the human perpetrators too lightly.

For STS scholars who treat “individuals” as assemblages of human and non-human actors, the concern is reversed. They fear that focusing on human actors alone would elide the very practical ways in which human intentions are carried through instruments and technologies that present themselves as “neutral” because they are non-human. Unless the ways in which power is mobilized and circulated through assemblages of both human and non-human actors is fully described, the practical means of countering such power will be hidden from view. Even if a particular minister is removed from office, the innocuous instruments that carry their intentions into practices would continue to mobilize that minister’s influence. For the STS scholar with an interest in studying Trumpism, the algorithms of Cambridge Analytica, the complex systems by which Facebook decides when it should intervene, and the symbolic and material affordances of the MAGA slogans and hats are all as integral to Trumpism as Trump himself. A Trump devoid of all these accoutrements would not be the same force, irrespective of his intentions and his growing ambitions. In fact, the Twitter-less Trump in Mar-a-Lago cannot mobilize action in the same way as the Trump who could sign executive orders in the Oval Office or speak from the bully pulpit in the White House Rose Garden. Material entities

vastly multiply human reach and agency, and a lack of attention to these actants not only tells an incomplete story, but it also reduces the scope for intervention.

Increasingly, the obvious ways in which such “actors” as climate change and AI are reconfiguring our lives is making the claim of posthumanist theorists seem less bizarre and more acceptable to more scholars. Although AI today increasingly act invisibly and undetectably, Siri and Alexa talk to us, obey our commands, and run errands for us—and the idea that they are agentic or can “act” and do things is less difficult to swallow, even for scholars from humanistic traditions. This is ironic since it is the anthropomorphism of non-humans that is making their agency more plausible to skeptics. However, while the more obvious “human-like” nature of AI and the increasingly pressing insistence with which climate change is demanding recognition as an agent of change may have made posthumanistic approaches more palatable, it is not clear to what extent the ontological politics of STS and other post-humanistic approaches will come to be accepted—not only by scholars, but also by practitioners and policy makers in education. Currently, the post-humanist diaspora itself appears fractured—seeking unity rather than accepting diversity, seeking to centralize epistemic value to its own particular strand rather than accepting the distributed and polycentric nature of power that is one of the core commitments of these theories.

EDITORS IN CHIEF – BIOGRAPHIES

Robert J Tierney

Rob Tierney is an international educator whose passion is for developing research partnerships to address local literacy needs with educators in different countries. Rob began his career as a classroom teacher in Australia, then proceeded to work in the United States, Canada, Australia and China. He is Dean Emeritus and Professor Emeritus of Language and Literacy Education at the University of British Columbia, the former Dean and Honorary Professor of the Faculty of Education and Social Work at University of Sydney, and a Distinguished University Professor at Beijing Normal University. In the United States, he has served on the faculties of the University of Illinois, University of Arizona, The Ohio State University, Harvard University, and the University of California. Rob has written a number of books and numerous articles on literacy especially related to global issues, diversity, and literacy development. His most recent book was entitled *A History of Literacy Education: Waves of Research and Practice* published by Teachers College Press in 2021. During his tenure as an educator, he has served as the President of the International Literacy Association, President of the Literacy Research Association, an Editor for the *Reading Research Quarterly*, the President of the Association of Canadian Deans of Education/ L'Association Canadienne des Doyens et Doyennes d'éducation, as well on a number of committees and boards for professional groups and government and nongovernment

agencies. In addition, he has been involved on a range of groups on projects globally including in Africa and Asia including for UNESCO, Children's Television Workshop, and Apple Computer.

Fazal Rizvi

Fazal Rizvi is an Emeritus Professor of Global Studies in Education at the University of Melbourne, as well as at the University of Illinois at Urbana-Champaign. He is also a Visiting Professor at the Universities of Turku in Finland and Pretoria in South Africa. He has written extensively on issues of identity and culture in transnational contexts, globalization and education policy, and Australia–Asia relations. He has published widely, and his book, coauthored with Bob Lingard, *Globalizing Education Policy* (Routledge 2010) is used widely in courses around the world. A sequel to this book, *Reimagining Globalization and Education* (Routledge 2022) has been published recently. Fazal is currently researching educational reform in Bhutan. He is a Fellow of the Australian Academy of the Social Sciences, a past Editor of the journal, *Discourse: Studies in Cultural Politics of Education*, and a past President of the Australian Association of Research in Education.

**Kadriye Ercikan**

Kadriye Ercikan is Vice President of Research and Measurement Sciences at the Educational Testing Service and Professor Emerita at the University of British Columbia. She is responsible for ETS's foundational and applied research and psychometric support of ETS's major testing products and contracts, and the NAEP contract for ETS. Her research focuses on validity and fairness issues and sociocultural context of assessment. Her recent research includes validation of score meaning using response processes, use of response process data for comparing groups and examining fairness and validity of interpretation, and use of scores from artificial intelligence-based automated scoring.

Ercikan is a Fellow of the International Academy of Education. Her research has resulted in 6 books, 4 special issues of refereed journals, and over 100 publications. She was awarded the AERA Division D Significant Contributions to Educational Measurement and Research Methodology recognition for another

coedited volume, *Generalizing from Educational Research: Beyond Qualitative and Quantitative*

Polarization, and received an Early Career Award from the University of British Columbia. Ercikan has been selected to serve as the NCME Book Series Editor (2021–2026).

EDITORIAL BOARD

Jason Beech

School of Education Culture and Society, Faculty of Education, Monash University, Melbourne, Australia

Qing Gu

UCL Centre for Educational Leadership, UCL Institute of Education, University College London (UCL), London, United Kingdom

SECTION EDITORS

Jason Beech is Associate Professor (Global Policy) at the University of Melbourne and visiting professor at Universidad de San Andrés in Buenos Aires where he holds a UNESCO Chair in Education for Sustainability and Global Citizenship. He is senior researcher of the National Council for Scientific and Technical Research of Argentina (CONICET), and Associate Editor of *Education Policy Analysis Archives*. He has been a member of the Board of Directors of the Comparative and International Education Society (2014-2016). Jason has published extensively on the globalization of knowledge and policies related to education. He has also written and is passionate about the challenges of educating for global citizenship and a sustainable future. He has taught in several universities in the Americas, Europe and Australia.

Professor Qing Gu is Director of the UCL Centre for Educational Leadership and Professor of Leadership in Education. She is the Past Chair of the *British Association of Comparative and International Education* (BAICE), Co-Editor of *Teachers and Teaching: Theory and Practice*, Associate Editor of *International Journal of Educational Development*, a member of the Research Standing Committee of the World Council of Comparative Education Societies (WCCES), and a member of the Research Evidence and Impact Panel for the Leadership College for UK Government. Professor Gu has directed and codirected many government and research council funded projects in the areas of teacher professional development, school improvement, and systemic reform and change. She has led a £1.9 m UK Economic and Social Research Council (ESRC) funded project *Schools as Enabling Spaces to Improve Learning and Health-Related Quality of Life for Primary School Children in Rural Communities in South Africa*. Some of her books have been translated into Chinese, Japanese, and Spanish.

Professor Smith is a New Zealand Maori of Te Aitanga a Hauiti, Ngati Porou, Kati MamoeNgati Apa, Ngati Kahungunu descent. He is a highly regarded and internationally recognized, Maori educationalist and scholar. He has been at the forefront of transforming Maori and Indigenous social, economic and cultural conditions through re-developing education and schooling outcomes. His work links theoretical thinking and practical applications within an ongoing cycle of transforming praxis.

Professor Smith trained as a teacher at Auckland Teachers College and taught in Auckland schools. He also lectured in Education at the Auckland College of Education. He was one of the first teachers and developers of a Kura Kaupapa Maori, an alternative, Maori philosophy and principles-based School. These Maori immersion schools have grown from a single entity in 1988 to over seventy-five publicly funded schools in 2015. His theoretical leadership in the Education Department at the University of Auckland helped inform the emergence of Maori Education as a distinct field of study across the New Zealand Tertiary Sector. This work has encouraged a wide range of academic studies focused on overthrowing persisting inequities within and as a result of education and schooling in New Zealand. His significant contribution to New Zealand education is to be seen in his work related to Kaupapa Maori as a theory of Transformative Praxis. All of these elements derive from his PhD research entitled, "The Development of Kaupapa Maori: Theory and Praxis (1997)".

Professor Smith's later academic work centered on developing theoretically informed strategies related to transforming high and disproportionate levels of Maori cultural, political, social, educational, and economic marginalization. He has been a significant scholar involved in the emergence of Tribal "university" institutions (Wananga) and is the former foundation Chair of the Council for Te Whare Wananga O Awanuiarangi. He led the successful Treaty of Waitangi Claim and settlement for Awanuiarangi. In his former position as Pro Vice Chancellor (Maori) at the University of Auckland, he was responsible for developing significant structural change within the institution while working within the Office of the then Vice Chancellor, Dr. John Hood. Notable achievements included implementing a Maori development strategy within the University which required all Deans to be responsive in their performance results for Maori and Pacific advancement; the oversight of the Proposal and winning of a National Centre of Research Excellence (Nga Pae o te Maramatanga); the initiation of the Maori and Indigenous doctoral program aimed at creating 500 Maori PhD graduates across the country in five years; the recruitment of top Maori academic scholars into the University of Auckland; the development of Kaupapa Maori as a theory of transformative praxis and which has had national and international influence. Professor Smith also served on the University of Auckland Council for three years as the Professorial representative for Academic staff.

In 2007 Professor Smith accepted a role as the Universitas 21 Distinguished Visiting Professor in Indigenous Education hosted by the University of British Columbia (within the Faculty of Education). Although the position was initially intended for two years, the role was extended for a further three years. While situated at the University of British Columbia, Professor Smith also chaired the Educational Policy Studies Department for three years. These positions allowed engagement with many Canadian universities as well as other universities across the world.

Professor Smith has made significant contributions to the political, social, economic, and cultural advancement of Maori and indigenous communities in New Zealand and around the Pacific Rim. He has worked extensively with other Native/Indigenous/First Nation's peoples across the world, including in Canada, India, US mainland (including extensive work in Hawaii and Alaska), Norway, Taiwan, Chile, Australia, as well as with selected Micronesian and Pacific nations. He is a regular contributor to national and international forums and conferences. Professor Smith has been an authoritative voice within the critical debates on *social, cultural and economic inequality* both in New Zealand and abroad, and he maintains a strong influence in the Maori/Indigenous languages revitalization movements.

Professor Smith stepped down from the administrative position of CEO/Vice Chancellor at Te Whare Wananga o Awanuiarangi in 2015 after eight years in the role. He resumed his academic research and writing career. In 2019 he was invited to take up a special Chair – Te Toi Ihorei ki Purehuroa – A "distinguished Professorial position at large" established for him at Massey University.

Professor Smith has been recognized and honored for his international contributions, receiving an Honorary doctorate (D.Litt.) from the Okanagan University College in 2005, and an Honorary doctorate (LLD) from the University of Northern British Columbia in 2013; he was elected as a Fellow of the American Education Research Association in 2014, and was awarded a Queens Honour – a CNZM in 2014. He was given the Prime Minister's Life-time Achievement Award (2017); and received the Te Ururangi National Award for Education (Matariki Awards, 2019).

Professor Smith is married to Professor Linda Tuhiwai Smith and they have one daughter and two mokopuna (grandchildren).

Therese N. Hopfenbeck is Professor of Measurement Analytics in the Melbourne Graduate School of Education, The University of Melbourne. Before starting her position in Melbourne, she was Professor in Educational Assessment and Director of the Oxford University Centre for Educational Assessment. She is a Visiting Fellow at Kellogg College, University of Oxford, elected Vice-President of *The Association for Educational Assessment-Europe* and Lead Editor of the journal *Assessment in Education, Principle, Policy and Practice*. Dr. Hopfenbeck's research agenda focuses upon bridging research on self-regulation and classroom-based assessment and making sense of international large-scale studies in education. In collaboration with Professor Nancy Perry, University of British Columbia, she is currently leading an international network of researchers disseminating classroom-based research, funded by Social Sciences and Humanities Research Council of Canada (2020–2022). She is also currently Principal Investigator for two research projects funded by IB, on critical thinking in PYP schools internationally and evaluation of education reforms in Kent, UK (2020–2022). In 2020, she led the research on Critical Thinking in the Diploma Program in Australia, England, and Norway (<https://ibo.org/research/outcomes-research/diploma-studies/critical-thinking-skills-of-dp-students/>). Dr. Hopfenbeck was Principal Investigator for the PISA (2022) study in England, Northern Ireland, and Wales, in collaboration with Pearson UK (2018–2023). She was the Research Manager of PIRLS (2016), funded by The Department of Education, UK.gov, and Principal Investigator of a major ESRC-DFID research study, Assessment for Learning in Africa (ES/N010515/1) (2016–2019). Since coming to Oxford in 2012, she has been the recipient of funding from ESRC-DFID, OECD, The Norwegian Research Council, Education Endowment Foundation, State Examinations Commissions Ireland, Jacob Foundation, and the International Baccalaureate totaling more than £2 mill in addition to a single grant of £4 mill in collaboration with SLATE: Centre for the Science of Learning & Technology at the University of Bergen, Norway. Prior to her appointment at Oxford, she worked as a postdoctoral researcher at the University of Oslo's research group for Measurement and Evaluation of Student Achievement at the Unit for Quantitative Analysis of Education (2010–2011). She is Adjunct Professor of the Norwegian University of Science and Technology (NTNU), member of the Visiting Panel for Research at the Educational Testing Service (ETS) in Princeton, expert member of the PISA (2022) Questionnaire Framework group, appointed by ETS and OECD (2014–2023). She has advised on the implementation of formative assessment programs in India, South Africa, Norway, and the Emirates and carried out policy work for UNESCO/OECD and the Norwegian Ministry of Education Norway. Therese has a presence on LinkedIn, ResearchGate, [Academia.edu](https://www.academia.edu/), and Twitter: @TNHopfenbeck.

tion, [UK.gov](https://www.uk.gov/), and Principal Investigator of a major ESRC-DFID research study, Assessment for Learning in Africa (ES/N010515/1) (2016–2019). Since coming to Oxford in 2012, she has been the recipient of funding from ESRC-DFID, OECD, The Norwegian Research Council, Education Endowment Foundation, State Examinations Commissions Ireland, Jacob Foundation, and the International Baccalaureate totaling more than £2 mill in addition to a single grant of £4 mill in collaboration with SLATE: Centre for the Science of Learning & Technology at the University of Bergen, Norway. Prior to her appointment at Oxford, she worked as a postdoctoral researcher at the University of Oslo's research group for Measurement and Evaluation of Student Achievement at the Unit for Quantitative Analysis of Education (2010–2011). She is Adjunct Professor of the Norwegian University of Science and Technology (NTNU), member of the Visiting Panel for Research at the Educational Testing Service (ETS) in Princeton, expert member of the PISA (2022) Questionnaire Framework group, appointed by ETS and OECD (2014–2023). Therese has a presence on LinkedIn, ResearchGate, [Academia.edu](https://www.academia.edu/), and Twitter: @TNHopfenbeck.

Nataliya Ivankova, PhD, MPH, is Professor in the School of Health Professions at the University of Alabama at Birmingham (UAB). As an applied research methodologist working at the intersection of mixed methods, qualitative, community-based, action, and translational research, she is internationally recognized for her empirical and methodological publications. She shares her research expertise through teaching mixed methods and qualitative research courses, conducting workshops and guest lectures, mentoring doctoral students and junior faculty, and serving as key personnel on funded research projects. At UAB, she directs an online graduate certificate program in *Applications of Mixed Methods Research* and oversees the design and analytical aspects of qualitative and mixed methods studies through the Center for Health Informatics for Patient Safety and Quality. She is a founding Coeditor of the *Mixed Methods Research Series* (Sage) and serves as an Associate Editor for the *Journal of Mixed Methods Research*.

Professor Jahnke is Director of Toi Kura Centre for Maori & Indigenous Education. She was the 2019 inaugural Toi o Te Wananga Fellow. Professor Jahnke holds professional qualifications in education and is cofounder and immediate past Chair of the Indigenous Peoples of the Pacific Special Interest Group of the American Education Research Association (AERA). She currently serves on the AERA Executive Committee. She was a member of the Social & Human Sciences Sub Commission of the NZ National Commission for UNESCO, the NZ Bioethics Council, the NZ Ethics Committee on Assisted Reproduction Technology, and Chair of NZ Health Research Council Ethics Committee. She is currently Cochair of the Aotearoa Research Ethics Board and a Fulbright Scholar.

Berit Karseth, PhD, is Professor at the University of Oslo, Department of Education. Karseth's main research and publications lie in the field of education policy, reforms, and curriculum studies. She has edited four books and written several journal articles and book chapters in both Norwegian and English. Her most recent publications in English include articles published in the *Journal of Education Policy*, *Scandinavian Journal of Educational Research*, *Journal of Curriculum Studies*, and *European Educational Research Journal*. Karseth was the elected dean of the Faculty of Educational Sciences at the University of Oslo 2013–2016 and is currently in the leadership team of the research group Curriculum studies, educational leadership, and governance (CLEG) at the same institution.

Dr. Kenneth Leithwood is Emeritus Professor at OISE/University of Toronto and an honorary professor at the University College London and the University of Nottingham. His research and writing is about school leadership, educational policy, and organizational change. He has published extensively on these topics. For example, his most recent books include *Leadership Development on a Large Scale: Lessons for Long-term Success* (2018, Corwin), *How School Leaders Contribute to Student Success* (2017, Springer), and *Linking Leadership to Student Learning* (2012, Jossey Bass). Professor Leithwood is the inaugural recipient of the University of Toronto's *Impact on Public Policy* award, AERA (2011) *Outstanding Leadership Researcher Award*, the 2012 *Roald F. Campbell Lifetime Achievement Award* from the University Council for Educational Administration, and the Ontario Principals' Council *Outstanding Educator of the Year* award for 2017. He is a *Fellow of the Royal Society of Canada*. A recently published bibliometric analysis found that Dr. Leithwood was the most frequently cited, highest impact educational leadership researcher in the world.¹ Research.com's 2022 Ranking of the Top 1000 Scientists in the area of Social Sciences and Humanities ranked Dr. Leithwood 70th in the world and 7th in Canada.

Xiufeng Liu is a Professor of Science Education at State University of New York, Buffalo, and a Fellow of the American Association for the Advancement of Science (AAAS). He obtained his PhD from the University of British Columbia in 1993. Before his current position, he taught high school chemistry in China, and was a tenured faculty member at St. Francis Xavier University and University of Prince Edward Island, both in Canada. From September 2020 to August 2022, he served as a program director in the Division of Research on Learning of the National Science Foundation. Dr. Liu conducts research on measurement and evaluation of STEM education and student learning of cross-cutting concepts of matter and energy. Dr. Liu is currently a Coeditor-in-chief for the journal *Disciplinary and International Science Education Research* (Springer) and an Associate Editor for the *Journal of Research in Science Teaching*, a premier journal in science education.

Margie Maaka is a Professor of Education at the University of Hawai'i at Mānoa. Her PhD is in educational psychology. She also holds professional qualifications in education from the University of Waikato and Hamilton Teachers College. She is cofounder and current Program Chair of the Indigenous Peoples of the Pacific Special Interest Group (SIG) of the American Educational Research Association (AERA). From 2017 to 2020, she served as a member of the AERA Executive Council and Chair of the SIG Executive Committee. Before that (2014–2017), Professor Maaka served as a member of the SIG Executive Committee. She has also served as a member of the Ngā Pae o te Māramatanga Center of Research Excellence International Research Advisory Panel. Her research on community-based educational renewal saw her recognized as a national scholar with the Goodlad Institute for Educational Renewal. As Cochair of the Sovereign Councils of the Hawaiian Homelands Assembly's Committee on Education, she prepared educators and educational leaders for public schools in the Hawaiian Home Lands Trust communities. Currently, Professor Maaka is committed to the preparation of indigenous educational leaders in higher education. Her research interests include community partnerships, educational psychology/indigenous educational psychology, indigenous development and advancement, educational policy, multiliteracies, and language and cognitive development.

Diane Mayer is Professor Emerita at the University of Oxford. Her research and scholarship focus on teacher education and early career teaching, examining issues associated with the policy and practice of teachers' work and teacher education.

Daniel McCaffrey is the Associate Vice President of Psychometric Analysis and Research in the Research and Measurement Science unit of the Research and Development division at ETS. Dan's research interests include the evaluation of artificial intelligence scoring of constructed responses, developing tools and methods for causal modeling, evaluating the psychometric properties of student achievement growth measures derived from annual test scores, and methods to account for measurement error in secondary data analysis. Dan received his PhD in Statistics from North Carolina State University in 1991.

Judy Parr is Professor Emerita at the University of Auckland, Faculty of Education, where she was the founding Head of the School of Curriculum and Pedagogy. A psychologist, Dr. Parr's research program is located broadly within improvement science. Her expertise is in literacy, specifically writing and its development, encompassing instructional issues like teacher knowledge and practice and the assessment of writing. Much research has been collaborative, with colleagues and practitioners within major national projects for school improvement aimed at raising achievement in literacy and, internationally, as part of funded large-scale research projects, for example in Canada and Norway. Dr. Parr has published widely in the areas of literacy, assessment, and professional learning.

Jeong-eun Rhee is a Professor of Education, Long Island University, Post, New York. Born and raised in Seoul, Korea, she earned her bachelor's degree in Educational Psychology from Ewha Women's University. In 1992, she came to the US as an international student and received an MA in Educational Psychology from West Virginia University and a PhD in Educational Policy and Leadership from the Ohio State University. As an interdisciplinary cultural researcher and educator, her recent work focuses on developing and supporting transnational, intergenerational, and decolonial feminist knowledge projects in/through antioppressive education. She recently published *Decolonial Feminist Research: Haunting, Rememory, and Mothers*, which received an honorable mention for the 2022 Qualitative Book Award of International Congress of Qualitative Inquiry.

Fazal Rizvi is an Emeritus Professor of Global Studies in Education at the University of Melbourne, as well as at the University of Illinois at Urbana-Champaign. He is also a Visiting Professor at the Universities of Turku in Finland and Pretoria in South Africa. He has written extensively on issues of identity and culture in transnational contexts, globalization and education policy, and Australia-Asia relations. He has published widely and his book, coauthored with Bob Lingard, *Globalizing Education Policy* (Routledge, 2010), is used widely in courses around the world. A sequel to this book, *Reimagining Globalization and Education* (Routledge, 2022), has been published recently. Fazal is currently researching educational reform in Bhutan. He is a Fellow of the Australian Academy of the Social Sciences, a past Editor of the journal, *Discourse: Studies in Cultural Politics of Education*, and a past President of the Australian Association of Research in Education.

Theresa Rogers is Professor of Language and Literacy Education at the University of British Columbia. Her research interests include youth arts, media and critical literacies, adolescent literature, and teacher education in literacy. Most recently she published "Youth Activism through Critical Arts, Transmedia, and Multiliteracies" in the *Oxford Research Encyclopedia*. She is author of the book, *Youth, Critical Literacies and Civic Engagement: Arts, Media and Literacy in the lives of adolescents* (Routledge) and numerous articles in scholarly journals such as *Literacy Research: Theory, Method and Practice*, *Reading Research Quarterly*, *Pedagogies*, *Language Arts*, *Children's Literature in Education* and *Journal of Literacy Research*. See: <https://ubc.academia.edu/TheresaRogers>.

Professor Chika Sehoole is a Professor of Higher Education and the Dean of the Faculty of Education at the University of Pretoria. He obtained his PhD at the University of the Witwatersrand, Johannesburg, in December 2002. In 2003/4 he was a visiting Rockefeller postdoctoral fellow at the Centre for African Studies at the University of Illinois in Urbana Champaign. In 2005/06 he was a New Century Fulbright Fellow, again, at the same university. His research interests are in the areas of higher education policy, internationalization of higher education, higher education in Africa, and teacher education. He has served in several international research projects focusing on higher education and providing expertise from the South African and African perspectives. In 2013–2017 he served as the Chairperson of the Board of the African Network for Internationalisation of Education (ANIE). He currently serves as the chairperson of the Education Deans' Forum of South Africa. He has published a singled authored book titled "Democratising higher education policy, constraints of reform in post-apartheid South Africa" by (Routledge); three edited scholarly books on higher education and more than 40 articles in journal articles, book chapters, and popular media.

Roland Sintos Coloma is a tenured Full Professor of Teacher Education at Wayne State University in Detroit, Michigan. A scholar of history, cultural studies, and education, his research addresses critical questions of race, gender, and sexuality from transnational and intersectional perspectives. His publications include *Asian Canadian Studies Reader* (2017), *Filipinos in Canada: Disturbing Invisibility* (2012), and *Postcolonial Challenges in Education* (2009). His articles have been published in top-ranked peer-reviewed journals, including *Curriculum Inquiry*, *Discourse: Studies in the Cultural Politics of Education*, *Educational Studies*, *Educational Theory*, *History of Education Quarterly*, *International Journal of Qualitative Studies in Education*, *Paedagogica Historica*, and *Race Ethnicity and Education*. He has successfully garnered over \$2 million of external funding from federal, education, and nonprofit agencies, including the US Department of Education, National Education Association, Spencer Foundation, and Schultz Family Foundation as part of the Bill & Melinda Gates Foundation's Grand Economic Challenges. Roland has served in various university leadership roles as an assistant dean, department chair, graduate coordinator, and center codirector. He was president of the American Educational Studies Association (2018–19), editor of the *Educational Studies* journal (2014–17), and program cochair of Division G (Social Context of Education) in the American Educational Research Association (AERA). He received the 2017 Distinguished Scholar Award from the AERA Research on the Education of Asian Pacific Americans SIG and the 2015 Article of the Year Award from the AERA Queer Studies and Education SIG. In 2020, he was appointed to the Governor of Michigan's statewide Asian Pacific American Affairs Commission. Born in the Philippines and raised in California, he completed his PhD in Cultural Studies in Education and Minor in African American and African Studies from The Ohio State University in 2004.

Roger Slee is the Founding Editor of *The International Journal of Inclusive Education* and *The Journal of Disability Studies in Education*. A former Deputy Director-General of Education in Queensland, Australia, he has advised governments on inclusive education policy and practice. His published books include: *The Irregular School*; *Inclusive Education Isn't Dead, It Just Smells Funny*; and *Ethics and Inclusive Education: Disability, Schooling & Justice* (with Gordon Tait). Roger was commissioned by the UNESCO to write the scoping paper for the 2020 Global Education Monitoring Report, *Inclusion and Education*. Roger also held the Chair of Inclusive Education at the Institute of Education, London, and is now the Diamond Jubilee Professor of Disability & Inclusion in the School of Sociology & Social Policy at the University of Leeds.

Ninni Wahlström is a Professor of Education at Linnæus University, Sweden. Her current research focuses on transnational and national policy discourses and their implications for national curriculum and classroom teaching from a perspective of curriculum theory and educational philosophy. Most recent publications are "School and democratic hope: the school as a space for civic literacy" in *European Educational Research Journal* (2022) and Wahlström (Ed.) *Equity, Teaching Practice and the Curriculum*, Routledge (2022).

Lei Wang is Professor and PHD advisor of the Institute of Chemical Education, the College of Chemistry in Beijing Normal University (BNU). She is also the member of Teaching Steering Committee on Basic Education of Ministry of Education of China and the director of its branch Committee on Secondary Chemistry Education, the director assistant of Faculty of Education of BNU, vice director of the Institute of Science Education of BNU, and Chairman of the Chemistry Education Committee of the Chinese Chemical Society. She is one of the chief experts in developing the *Secondary School Chemistry Curriculum Standards* of MOE. She works as the chief editor of high school chemistry textbooks (Shandong Science and Technology Press, 2004 and 2019 editions) and junior high school chemistry project-based learning textbooks (Shanxi Education Press, 2018 edition). She achieved the first prize of the National Basic Education Teaching Achievement Award, the second prize of the National Higher Education Teaching Achievement Award, and the BAOGANG Education Outstanding Teacher Award.

Everard Weber is a retired professor. He has worked in the field of education for more than 40 years. Currently he is a research associate at the University of Johannesburg (UJ) and an academic advisor in the Future Professors Programme (FPP) at UJ. He studied African Languages and History at the University of Cape Town and Comparative and International Education at Harvard University. In South Africa he has worked at Crestway High School in Cape Town, the University of the Witwatersrand, and the University of Pretoria. A recent book is *A home away from home: a community of international and South African university students*. The FPP is a government-sponsored initiative that seeks to develop the next generation of professors and academic leaders in all disciplines, across all universities in South Africa. He is in addition presently conducting fieldwork on curriculum change in South African higher education with Professor Shireen Motala and Dr. Venise Joubert at UJ. This project is grounded in the history of southern Africa and hopes to contribute to the scholarship of postcolonialism.

Ian A.G. Wilkinson is Professor in the Department of Teaching and Learning at The Ohio State University and Honorary Professor in the School of Curriculum and Pedagogy at the University of Auckland, Aotearoa/New Zealand. He has a background in educational psychology with special interests in cognition, instruction, and research methodology as they relate to the study of literacy. He served as coauthor of the influential report, *Becoming a Nation of Readers* (National Academy of Education, 1985). He was Co-Editor of *Reading Research Quarterly* from 2006 to 2012 and was inducted into the Reading Hall of Fame in 2021. His research examines the impact of classroom discussion and dialogue on students' reading comprehension and argument literacy and the implications for professional development of teachers. Recently he coauthored books include *The Most Reasonable Answer: Helping Students Build Better Arguments Together* and *Quality Talk About Text: Discussion Practices for Talking and Thinking About Text*.

David B. Yaden, Jr., PhD, is the *Jewell M. Lewis Endowed Distinguished Professor of Literacy* in the Department of Teaching, Learning and Sociocultural Studies at the University of Arizona. Prior to his present position at the University of Arizona, he held appointments at Emory University, the University of Houston, and the University of Southern California. He served as Co-Editor of the *Journal of Literacy Research*, one of the premier research journals in the field of literacy studies, and was a Principal Investigator in the federally funded Center for the Improvement of Early Reading Achievement (CIERA) where he implemented an early literacy curriculum for linguistically diverse preschoolers in inner-city Los Angeles. He also directed a statewide consortium of researchers from Arizona's major universities in the evaluation of the state's early childhood initiative to evaluate health, developmental, and educational factors contributing to school readiness. His research interests and specializations include developmental issues in early childhood education, the acquisition of literacy and biliteracy in young emergent bilingual children, family literacy, theories of reading disability, microgenetic research design, and the application of complex adaptive systems theory to growth in reading and writing.

Volume 2: Diversity, Democracy, and Social Justice in Education

Coloma Roland Sintos and Jeong-eun Rhee

Introduction: Struggling Against Virus of Hate

We continue to live, work, teach, learn, and advocate in challenging times. We write our Introduction to this encyclopedia volume on the third year of the COVID-19 global pandemic that has devastated many families, communities, and countries. The pandemic's latest official toll count includes over 565 million confirmed cases and over 6.3 million deaths around the world while true deaths are estimated around 15 million ([World Health Organization, 2022](#)). The pandemic has exacerbated and put into sharp relief existing social inequalities between and within countries, particularly along singular and intersecting lines of socioeconomic class, gender, and race ([Miguel and Mobarak, 2021](#)). The most adverse effects of the pandemic have negatively impacted lower-middle-income and low-income countries located in so-called developing and least developed nations in the Global South. In so-called developed countries in the Global North, like the United States, low-income and poor communities—especially those inhabited predominantly by Indigenous and racialized minority populations—have disproportionately higher rates of COVID-19 morbidity and mortality. During the pandemic, a larger share of women became unemployed or underemployed, thereby disrupting their professional and economic advancement and further distressing female-headed households ([OECD, 2020](#)). When the lockdowns took effect, individuals with limited or no available child or elderly care, personal transportation, Internet, and/or computers struggled to maintain or gain employment and to access services and resources, including medical and mental health support as well as food and household essentials. Hence, the global pandemic revealed in glaring ways the ongoing and deepening fissures of social injustice along national and class lines that are also highly gendered and racialized ([World Health Organization, 2022](#)).

During public health crises that adversely impact the lives, employment, education, and well-being of many individuals, families, and communities, a different form of virus also has been surging: Racism. In the United States where we live and work as Education university professors of Asian descent, anti-Asian racism and violence have become more rampant and visible ([Coloma et al., 2021](#)). Nearly 11,500 incidents of assaults, harassment, and civil rights violations against Asian Americans have been reported from March 2020 to March 2022 ([Stop AAPI Hate, 2022](#)). Asian American women, elderlies, and/or lesbians, gays, bisexuals, transgenders, and queers (LGBTQs) have been targeted, and many other incidents are not reported. Amid the global COVID-19 pandemic, Asian American and Asian international students, faculty, and staff experience racist discrimination and microaggression in US colleges and universities. As plans for returning to campus unveil for the Fall 2022 term, many continue to be gravely concerned about our safety and well-being in light of bigoted rhetoric and actions.

Since US higher education is our professional context, we begin this Introduction with the ongoing COVID-19 pandemic, its global ravages and consequences, and the increasing and more visible anti-Asian racism and violence in the United States. Our editorial position for this volume is that an approach to issues of diversity, democracy, and social justice in education needs to be contextualized and historicized. In this sense, it is important to note that the entire encyclopedia—and, for our discussion, this volume—have been further developed, written, and published during a worldwide public health, economic, and social crisis that we have not experienced during our lifetime. Unfortunately, it may not be surprising that the already vulnerable and marginalized are the ones disproportionately burdened by the pandemic. At the same time, Asians—especially those in the diaspora—have become targets of pandemic-fueled hate and harm. As Asian Americans with filial and transnational ties to the Philippines and South Korea, we struggled and continue to struggle with public and educational spaces where our physical and emotional well-being could be quickly compromised. Therefore, we discuss how our positionalities are intricately intertwined with ways we have worked on this volume.

Asians and Asian Americans are largely invisible in US higher education ([Teranishi, 2010](#)). (Please note that we as editors will use the pronoun “we” in addressing issues relevant to Asians and Asian Americans in the United States as part of a collective embodied experience and racialized solidarity). We appear in statistical reports and publicity photos on institutional diversity and demographics, yet receive little, if any, culturally relevant curriculum, programming, and services. We bolster student enrollment, selectivity, and graduation data and generate revenue through tuition dollars, especially from Asian international students who are aggressively recruited to come to the United States. When the Trump administration restricted visas and enrollment of international students in July 2020, more than 200 institutions of higher education as well as 70 higher education associations wrote and testified to challenge this policy. Yet many colleges and universities do not provide us with culturally and linguistically affirming resources to enhance our learning and campus life. Asian and Asian American faculty substantially contribute to institutional missions of scholarship and teaching, but are scarce in leadership positions in higher education. In fact, the lack of meaningful response from many institutions on the rising anti-Asian violence and racism raises serious questions if they truly care for their campus community members of Asian heritage.

Stereotyped as model minority, Asians and Asian Americans are often perceived as academically successful and self-reliant. Hence, the misconception is that we do not need policies, curriculum, and sociocultural, linguistic, and mental health support in US higher education. We are more likely than white and other minority students to have considered or attempted suicide, but receive mental health services at a lower rate ([Chen et al., 2019](#)). Where Asian Americans are visible is in a spin-off narrative of the model minority stereotype that pits us against other racialized minority groups. The ongoing debates and lawsuits on

affirmative action and race-conscious admissions point to the number of Asian American students in highly selective universities and position us against other minorities, particularly African Americans, even though a majority of Asian Americans support race-conscious equity policies (Lee et al., 2021). Such ill-informed zero-sum game and wedge politics are used to perpetuate anti-Black racism and to erase the white supremacist strategy of divide-and-conquer. They also fail to account for the long history of Asian-Black coalitions for racial justice in the United States and globally (Boggs, 2016; Zia, 2000).

To this day, Asian Americans are perceived as perpetual foreigners who do not belong in the United States. Regardless if we are recent immigrants or citizens whose families have lived in the United States for generations, our status as legitimate Americans remains conditional, suspect, or invalidated. As perpetual foreigners and outsiders, Asian Americans become expedient scapegoats for US domestic and international woes. Trump's failure to contain the COVID-19 pandemic resorted to a tactic of deflecting attention and describing the virus as "Chinese virus" and "kung flu." Many agree that Trump's repeated use of racist monikers has contributed to increased anti-Asian bigotry and attacks. Words matter. When conveyed by those in control and authority, racist discourses wield a powerful influence over individual beliefs, perceptions, and actions. Through racist eyes, all Asians and Asian Americans are the same: Yellow Perils (Tchen and Yeats, 2014).

Yet Asian Americans are extremely diverse. Estimated at 22.86 million in 2019, we constitute 6.8% of the US population and are the fastest growing racialized group (Budiman and Ruiz, 2021). With about 14% of US residents born outside of the country, Asia is the second largest source of immigrants, following Latin America. The top 10 Asian ethnic groups by order of their current population size in the United States are: Chinese, Asian Indian, Filipino, Vietnamese, Korean, Japanese, Pakistani, Thai, Hmong, and Cambodian, who are also implicated in complex inter/intra-ethnic geopolitical histories. Differences within and between these groups range from generations, socioeconomic statuses, and educational levels to languages, religions, and political perspectives. In fact, Asian Americans have the largest socioeconomic divide among all racial groups (Hassan and Carlsen, 2018). Yet in spite of our heterogeneity, Asian Americans are largely considered a monolithic minority group.

Stereotyping Asian Americans as model minorities who could allegedly accrue academic and economic capital unlike other racialized minorities does not mean that Asian Americans—and those who are perceived as Asians—are less subject to racist suspicions, microaggressions, and outright violence. This pandemic has repeated histories of the ways anti-Asian racism disenfranchises our status and belonging as Americans in the United States. United Nations Secretary-General António Guterres (2020) indicated that the "pandemic continues to unleash a tsunami of hate and xenophobia, scapegoating and scare-mongering," and consequently called on political leaders, educational institutions, media companies, and civic groups to "act now to strengthen the immunity of our societies against the virus of hate."

Our involvement with local and other initiatives to address anti-Asian racism as well as racial discrimination against other minoritized groups established part of our intellectual, political, and educational frames in conceptualizing this encyclopedia volume. A larger part also drew from our long-standing personal, professional, and academic interests in diversity, democracy, and social justice matters from transnational and postcolonial perspectives (e.g., Coloma, 2017; Rhee, 2009, 2013). As researchers and educators who work to challenge Euro-American intellectual, political, socioeconomic, and educational hegemony, we tasked ourselves to formulate an encyclopedia volume that could represent, as much as possible, a wide range of critical voices from different fields of education and beyond and from various institutions and countries, especially from the Global South and areas where English is not a dominant language. Toward these ends, we were guided by feminist works on recognition, redistribution, and refusal, which coincidentally mapped on to our conceptualizations of diversity, democracy, and social justice in education (Fraser, 2003; Simpson, 2017).

Nancy Fraser (2003) examines historical and contemporary struggles for social justice from the vantage points of recognition and redistribution. On the one hand, the goal of the politics of recognition is to promote "a difference-friendly world, where assimilation to majority or dominant cultural norms is no longer the price of equal respect" (p. 7). On the other hand, the goal of the politics of redistribution is to advance "a more just distribution of resources and wealth" (p. 7). Conventionally understood as a marked distinction between identity politics (based on race, gender, sexuality, etc.) and class politics, Fraser does not view the politics of recognition and redistribution as separate and incommensurable. Rather, she considers them as interconnected and complementary. Following Fraser, we consider the ways diversity, democracy, and social justice in education can be understood through recognition and redistribution.

In the politics of recognition, the identification of identities or subject positions functions as important markers when addressing not only visible and not-so-visible differences but also varying power relations embedded in dynamics of oppression, privilege, and complicity at the individual, interpersonal, and institutional levels (National Equity Project, n.d.). Such identification is tied to who is represented or who is at the table, if you will, when attending to certain social, institutional, and educational issues and concerns. In such inquiries, educators, researchers, and advocates generally take up the perspectives of race and ethnicity, Indigeneity, gender, sexuality, socioeconomic class, dis/ability, language, religion and spirituality, nationality and citizenship, migration and diaspora, and geography (urban, suburban, and rural as well as Global North and Global South)—a list which informed our initial conceptualization of this volume's first two sections on Key Concepts and on Identity and Difference (more on these sections below). Such perspectives have been examined, expounded, and extended by theoretical frameworks, such as critical race theory, ethnic studies, multiculturalism, feminist theory, queer theory, trans theory, gender and sexuality studies, Marxism, disability studies, crip theory, diaspora studies, transnationalism, postcolonial theory, decolonization, and settler colonialism, among many others. While we recognize the salience of single issue/lens analysis, we are also committed to intersectional analysis inspired by feminist of color and queer of color theorizing that accounts for the ways identities, experiences, and social and institutional conditions are intertwined. In our case, we are not only Asian American, queer man or heterosexual woman, able-bodied, raised Christians, married,

urban-dwellers, or US citizens, as if such identities can be separate. We are a combination of these identities and so much more. Some of these identities can be detected in visible ways, while others cannot be. Yet these subject positions shape how we see the world and how others view and treat us. Hence, in the politics of recognition, it is important to have various identities represented to lift up diverse voices and perspectives, especially when some have been historically and continuously marginalized, dismissed, or erased.

In the politics of redistribution, the availability, allocation, and dissemination of material and symbolic opportunities and resources for educational and community needs is the central priority for educators, researchers, and advocates and is largely considered through equal or equitable mechanisms (National Equity Project, n.d.). On the one hand, equality means that individuals and groups are provided with the same opportunities and resources regardless of historical and current needs, conditions, and preferences. On the other hand, equity considers the historical and ongoing circumstances of individuals and groups, so that they are provided with opportunities and resources needed to reach their desired goals and highest potential. The persistent debates between equality and equity informed our preliminary considerations of this volume's next two sections on Primary and Secondary Education as well as Adult and Higher Education as we tackled formal institutional spaces of education (more on these sections below). Moreover, these debates manifested in governmental responses to the COVID-19 global pandemic, especially in accessing and distributing vaccines. Wealthy countries in North America, Europe, and the Gulf have been ordering, bulk-buying, and hoarding vaccines, prioritizing the needs of their own citizens, a political-economic and public health move dubbed as "vaccine nationalism" (Bollyky and Bown, 2020). These countries have struck deals and contracts with pharmaceutical companies manufacturing COVID-19 vaccines with orders that often surpass the dosage needs for vaccine and booster shots of their populations. Since the start of the pandemic, wealthy countries, such as the United States, have disproportionately received far more vaccines, compared to low-income and middle-income countries. Instead of equal or equitable access and distribution of life-saving resources, they display and exercise outright greed and selfishness in the name of national safety, well-being, and self-protection, while disregarding the lives and conditions of the world's majority, as if all our lives, well-being, and quotidian realities are not globally interconnected. They leverage their national wealth and global status to acquire resources that enable their people to live while letting others die.

When we bring together the politics of recognition and redistribution to analyze the global supply and distribution of life-saving vaccines against the COVID-19 pandemic, a long-standing pattern emerges, once again: benefitting are wealthy countries, mostly in the Global North, with predominantly white populations; and continuing to suffer are low-income and middle-income countries, mostly in the Global South, with predominantly Black and Brown populations. The consequences of the global pandemic have also disproportionately burdened women, people with disabilities, as well as communities and countries with limited or no access to computers and broadband technologies. Ultimately, the ongoing global pandemic has made visible and exacerbated existing inequities based on individual and intersecting fault-lines along geography, socioeconomic status, race, gender, dis/ability, and technology. However, must we accept such realities or inevitabilities? Must we consent to how the world continues to operate, especially who benefits and who suffers in these conditions? How might we refuse such seemingly universalizing norms?

Moving beyond the politics of recognition and redistribution, Audra Simpson offers refusal as a necessary critical intellectual, methodological, and even pedagogical intervention to matters related to diversity, democracy, and social justice in education. For Simpson (2017), "refusal" rather than recognition is an option for producing and maintaining alternative structures of thought, politics, and traditions away from and in critical relationship to states" (p. 19). Grounded in historical and ongoing struggles for Indigenous sovereignty, onto-epistemology, and revitalization, Simpson's work has inspired us to further promote Indigenous and decolonizing thought and praxis in local and global movements and to raise questions to what has been normalized as universal and status quo. Such questioning has led us as editors to consider informal and nonformal education spaces as sites for teaching and learning, which manifested in this volume's last two sections on Informal Education and on Activism and Social Movement (more on these sections below). Simpson's concept of refusal has also led us to inquire into the ways the very concepts of the encyclopedia volume may be already embedded within hegemonic Euro-American-centric use and understanding. For example, Indigenous philosophy and politics call attention to the conventional use and understanding of citizen and citizenship as defined by settler colonial nation-states responsible for Indigenous genocide, land theft, and broken treaties. They challenge who gets to be defined as proper citizens with rights and under whose terms, as seen in settler colonial nation-states such as the United States, Canada, and Australia. What are the terms and definitions? And under what and whose terms? These questions further complicate even critical terms, such as diversity, democracy, and social justice, when they are primarily conceptualized from Euro-American and Global North perspectives and do not fully account for the ways Indigenous and Global South frameworks make sense of and utilize them. As an international encyclopedia, this is certainly an important area that we hope could be taken up further in future volumes. As editors, we acknowledge our own conceptual limitations and blind spots and mark particular topics that we yearned to include in this volume but hopefully could be addressed in future iterations.

The encyclopedia volume on Diversity, Democracy, and Social Justice in Education contains 46 chapters, not including this Introduction. The chapters have been organized into six thematic sections on Key Concepts, Identity and Difference, Primary and Secondary Education, Adult and Higher Education, Informal Education, and Activism and Social Movement. We offer a brief overview of each section below.

The first section on Key Concepts serves as the overarching guide for the entire volume by identifying and defining important terms and providing insightful examples and case studies. Beginning with concepts underpinning this volume—diversity, democracy, and social justice—this section takes up additional concepts, such as culture, decolonial, citizenship, migration, human rights,

international development, ethnonationalism, and globalism, and elaborates on their definitions, uses, and applications through examples from Global North and Global South contexts. Future volumes could add specific chapters on other concepts, such as anti-oppression, inclusion, ontology, epistemology, methodology, pedagogy, and even praxis as part of this section. The volume's second section on Identity and Difference builds upon the first section by explicating how the key concepts are connected to particular markers of identity and difference. Hence, this section begins with an explanation on identity and its connections to diversity and education. It is followed by chapters on intersectionality, race and gender, feminism (especially on feminisms of color), girls with disabilities in the Global South, Indigeneity, and political orientation. Largely due to the proliferating mobilization of intersectional analysis at local, regional, national, and global levels, it has become a significant approach utilized by researchers, educators, and advocates alike. For this section, future volumes could add specific chapters on race and ethnicity (especially as understood in various geographical contexts), socioeconomic class, gender and gender identity, sexuality and sexual orientation, dis/ability, linguistic minority, religion and spirituality, geographical location (urban, suburban, rural), and geopolitics (North–South and South–South).

The volume's next sections emphasize formal institutions and processes of education. The third section on Primary and Secondary Education attends to cultures, policies and politics, curriculum, teaching and learning, students and educators, and broader social contexts of schools. Starting with curriculum and policies on global and international education, the section elaborates on school curricula, such as Afrocentric education, comprehensive sexuality education, and multilingual education; school disciplinary areas, such as literacy, ecology, and environmental education; school experiences, such as those of LGBTQ students and educators; and school contexts, such as elite schools and participatory democracy. Future volumes would do well adding chapters on multicultural education, Indigenous education, ethnic studies in schools, special education and disability studies, religious schooling, and career/technical education. The fourth section on Adult and Higher Education underscores the education of adults in colleges, universities, and workplaces as well as the wider global contexts of such education. With teaching responsibilities in the field of teacher education, we also included the preparation of preservice and in-service teachers in this section. Hence, the chapters in this section tackle work and learning, minorities and the knowledge-economy, global university rankings, the interconnectedness of global and Indigenous education, and critical topics for teacher education, such as Truth and Reconciliation research, racial literacy, and diversity discourses in non-Euro-American contexts.

The volume's last two sections draw inspiration from informal and nonformal spaces and actors of education, thereby disrupting mainstream understanding of schools, colleges, and universities as the only legitimate institutions and mechanisms of teaching and learning. The fifth section on Informal Education offers robust chapters on community-based education, media education, arts-based education, and museum education. It accounts for women and youth as informal educators and attends to virtual spaces, environmental citizenship, and shadow (tutoring) education where informal teaching and learning take place. Future volumes could elaborate on additional topics, such as mothers/parents as informal educators, popular culture, health, and wellness, especially informal and nonformal education during global pandemics. The sixth and final section highlights Activism and Social Movement as important educational sites and mechanisms for diversity, democracy, and social justice. Similar to Informal Education, Activism and Social Movements often fall outside of formal institutionally sanctioned realms of curriculum, teaching, and learning. Although many schools, colleges, and universities may include mission statements on diversity, equity, and inclusion as well as pedagogical priorities to critical thinking and community engagement, they generally do not condone activism and social movements deemed radical or disruptive of the status quo. Hence, when students and educators participate in advocacy and organizing, especially to address inequities and injustices in schools, higher education, and society at large, they inevitably encounter conflicts with those in positions of power and authority. As the chapters in this section reveal, some activists may emphasize local issues, but their impact and consequences resonate more expansively at the state, national, and even global levels. Other activists may take up an educational topic as their major concern, yet it is intrinsically connected to broader social dynamics and vice versa. Authors in this section address a remarkable range of activism and social movements, from Black Lives Matter and educational access for undocumented migrants, to young women, college students, and teachers fighting for rights, resources, and legitimacy. They offer concrete and informative examples of activist strategies, personal and collective narratives, successful campaigns and difficult lessons learned, internal and external pressures and conflicts, and the joys and challenges of advocating for genuine change and transformation. Future volumes could provide examples of other social movements, especially from Indigenous and Global South contexts, so that we could gain lessons of education and solidarity from activists and educators "from below" (Della Porta et al., 2006).

As this volume's editors, we are deeply grateful to the encyclopedia's editors-in-chief Fazal Rizvi, Rob Tierney, and Kadriye Ercikan for inviting us to take the lead on this important collection on Diversity, Democracy, and Social Justice in Education, which will be the first of its kind in the encyclopedia's history and various editions. We appreciate their inspiring and compelling vision for the entire international encyclopedia, and their ongoing guidance and support as we undertook this daunting initiative during a very challenging period. Paula Davies and the technical and production team from Elsevier are the consummate professionals who, with meticulous care and good humored patience, have truly been instrumental in the beautiful and timely completion of this volume (and this entire encyclopedia). Lastly, we could not have undertaken this volume without the brilliance and commitment of the 80 authors—scholars, educators, students, and activists from around the world—who willingly shared their wisdoms, experiences, and perspectives with us as editors and now with you as readers. When we initially conceptualized this volume, we charted a rather ambitious agenda with a robust list of chapter topics and potential authors, reflecting educational questions, sites, and voices from various countries across continents. The mighty 80 who generously accepted our invitations submitted and revised their

chapters and worked through feedback and follow-up, while grappling with the quotidian uncertainties and dire repercussions of the COVID-19 global pandemic on their personal and professional lives. What the authors gave us, ultimately, are precious gifts of their knowledge and time. And we are forever thankful and blessed for their gifts. It is our sincere hope that what we are able to offer here individually and collectively can invite, incite, and inspire ongoing praxis of diversity, democracy, and social justice in education and beyond.

Introduction

This chapter looks at the development of diversity from its race relations original emphasis and the ways in which it has developed. Diversity in the 21st century is more than a race relations issue. Diversity is now viewed not only in terms of race, but includes ethnicity, class, gender, region, sexual orientation, ability, and religion, inter alia. As will become clearer in this chapter, diversity now is more about recognizing difference, and working constructively with difference in order to move toward a more social just and inclusive world. As will also be clearer later in this chapter, it is, thus, important to also recognize that diversity needs to be viewed as being linked to difference and inclusivity.

This chapter is written from a South African perspective. The South African experience provides an important perspective of the dangers in using diversity and how it can construct the basis for segregation, as was the case under apartheid in South Africa. While this is the perspective and lens from which this chapter is written, it engages with the way diversity has also been used in other country contexts.

The first part of this chapter deals with diversity and race relations. The second part deals with diversity and inclusivity, and the third part deals with diversity and difference. The conclusion of this chapter argues that it will be more productive and constructive to deal with difference, since the continued use of diversity will perpetuate the historical baggage of meaning that has come to inform diversity.

Diversity and race relations

Diversity in South Africa has a specific meaning due to the history of apartheid. The racist segregation of South Africans was justified by apartheid ideologues and in policies and legislation by reference to cultural and ethnic diversity (Rose and Tunmer, 1975). Apartheid claimed that four “race” groups existed: “whites”, “coloreds”, “Indians” or “Asians”, and “blacks”. The differences among these “race” groups were argued to have been not due to “race” but due to cultural differences among them. Apartheid justified itself on the basis of cultural diversity (Carrim, 1995, 2018; Cross, 2004; Verwoerd, 1953).

Two important things emerge from the above. First, diversity was linked to culture and “race”. Second, are the problems related to defining people in racial terms.

Apartheid South Africa used diversity as linked to culture and “race” as a means to deal with race relations. South Africa was not alone in doing this. Apartheid was officialized in 1948 when the white National Party government came into power. Soon after World War II, the United Kingdom, for example started dealing with “race” relations issues to deal with what it then called the colored immigration problem (Rex and Mason, 1986). Approaches to dealing with “race” relations issues included “assimilationism”, “integration”, “multiculturalism”, and “anti-racism” (Carrim, 1995). Dealing with the issues related to “race” relations, thus, became linked to culture and how to deal with the diversity of cultures became the focus.

Apartheid South Africa’s answer to this issue was to organize South Africa systemically and systematically on the basis of racist segregation. The Population Registration Act ensured that people were classified as white, colored, Indian/Asian, or black. The Group Areas Act ensured that people lived in areas that were designated for their racial groups. The different education Acts ensured that schools catered for differently classified racial groups in segregated spaces. The entire edifice of Apartheid was thus constructed to ensure segregationism and racism and it justified this on the basis of recognizing differences in cultures among South Africa’s people. The then Prime Minister of South Africa H.F Verwoerd’s speech in the “white” Senate of parliament said the following to justify Bantu Education (an education for “blacks”).

It is the policy of my department that education should have its roots entirely in the Native areas and in the Native environment and Native community. There Bantu education must be able to give itself complete expression and there it will have to perform its real service. The Bantu must be guided to serve his own community in all respects. There is no place for him in the European community above the level of certain forms of labour. Within his own community, however, all doors are open.

For that reason, it is of no avail for him to receive a training which has as its aim absorption in the European community while he cannot and will not be absorbed there. Up till now he has been subjected to a school system which drew him away from his own community and practically misled him by showing him the green pastures of the European but still did not allow him to graze there. This attitude is not only uneconomic because money is spent on education which has no specific aim, but it is even dishonest to continue with it. The effect on the Bantu community we find in the much-discussed frustration of educated Natives who can find no employment which is acceptable to them. It is abundantly clear that unplanned education creates many problems, disrupts the communal life of the Bantu, and endangers the communal life of the European.

For that reason, it must be replaced by planned Bantu Education. In the Native territories where the services of educated Bantu are much needed, Bantu education can complete its full circle, by which the child is taken out of the community by the school, developed to his fullest extent in accordance with aptitude and ability and thereafter returned to the community to serve and to enrich it.

Verwoerd (1953, Speech as Minister of Native Affairs, June 7, 1954).

The link between racist segregationism and cultural diversity was made explicit by Apartheid. Cross (2004) described apartheid as an extreme form of multiculturalism. Its extremeness was due to the blatant inequality that Apartheid constructed between “whites”, on the one hand, and “coloreds”, Indian/Asians, and blacks, on the other hand; and the extreme segregationism it imposed. For Apartheid, it was separate and unequal.

The second issue raised above was the problem of defining people in racial terms. Apartheid defined people as “white”, “colored” Indian/Asian, and “black”. Colored was meant to refer to people of mixed descent. Yet, although “white”, “colored” and “black” referred to skin pigmentation, “Indian/Asian” are geographical descriptions and not a description of color or skin pigmentation. In the Senate speech of Verwoerd referred to earlier one will also note that “whites” are referred to as “Europeans”.

Despite the inconsistencies of these racial/racist descriptions of South Africans, when it comes to differences in cultures, two things seem to happen. The first is that “whites” are projected as if they have a homogenous culture. Differences between the French, Germans, Dutch, etc. are ignored. Second, it is only when it comes to people who are not “white” that cultural differences are seen to be at issue. This leads to the important argument made by anti-racists and anti-apartheid (and anti-colonial) activists in their responses to diversity and viewing diversity as linked to cultures.

Anti-apartheid activists, and anti-racists, in other parts of the world noted that dealing with “race” relations as if they are about differences in cultures ignores the reality of racism. Looking at diversity of cultures does not address the power relations in society which privilege “white” people. It ignores the systemic ways in which racism is institutionalized and the ways in which a sense of “white” superiority and entitlement are constructed. Diversity of cultures which focus on differences in language, beliefs, customs, traditions, tastes, food, and dress do not address the racism of societies. Instead, diversity of cultures is an ideological mechanism which allows racism to continue (Bhaham et al., 1992; Gillborn, 1990). This was abundantly clear under Apartheid which constructed a racist society in the interests of “white” people could ideologically justify this by suggesting it was a way to recognize people’s cultural diversity. Diversity as a reference to cultures as a way to deal with “race” relations is a way to obscure the systemic and institutionalized construction of racism in people’s lives.

The “new” South Africa has on its coat of arms the phrase “United in our Diversity” (www.sahistory.org.za/chapter/coat-of-arms). It is important to elaborate on why this is the case. Although Apartheid perverted and subverted cultural diversity to suit its racist plans, it would be incorrect to suggest that there is no cultural diversity among people who have been defined racially. The “United in our Diversity” is meant to recognize that people have a right to their own cultures, languages, cultures, styles, dress, and food, etc. and these forms of diversity are a source of strength and resource for the country. It also recognizes that all people are entitled to such cultural rights on the basis of equality.

The problems with viewing diversity as a matter of “race” relations and consequently in terms of differences in cultures is that it tends to essentialize people in these terms. It suggests that people are only what cultures they belong to, and the experience of Apartheid shows that this can be done in a way that is profoundly unjust, unequal, and racist. It also shows that people are more than what they are defined as being racially or culturally. As Vertovec (2015) puts it:

Why is there so much interest in ‘diversity’ now? There are many reasons offered. Perhaps the foremost reason is the success, increasingly and commutively since the 1960s, of the key struggles of the identity-based public/political campaigns among women, African Americans, lesbian and gay, age- and disability-based movements.

Vertovec (2015: p. 1).

In this regard, people are more than just their “race” and culture. They are also classed, gendered, have different sexual orientations and with different abilities and of different ages. It is when people are viewed beyond “race” and cultural terms, that these other forms of identities that are also part of who people are become more visible and important.

Diversity and inclusivity

The “new” democratic South Africa sees itself as a non-racial, non-sexist, and democratic South Africa, and in its Constitution, it recognizes the following identities as part of the Bill of Rights.

The state may not unfairly discriminate directly or indirectly against anyone on one or more grounds, including race, gender, sex, pregnancy, marital status, ethnic or social origin, colour, sexual orientation, age, disability, religion, conscience, belief, culture, language, and birth

South African Constitution (1996).

This clause in the South African Constitution’s Bill of Rights recognizes more identities than the [Universal Declaration of Human Rights \(1948\)](#). What is significant about this is that it is another view of diversity that goes beyond simply recognizing people racially or culturally, while still recognizing these. “Race” and culture are a part of people’s identities, but people are also gendered, classed, speak different languages, have different abilities, religions, political and sexual orientations, age and in different regions, following on the provisions of the South African Bill of Rights. When diversity is viewed in these ways, diversity is more about inclusivity.

The idea of inclusivity has been prominent in the debates and developments of inclusive education. In inclusive education, the struggles of disabled people have been highlighted to indicate the need to mainstream provision for disabled learners in general schooling, and not to keep them segregated from so-called normal schools ([Slee, 2011](#)). Although debates continue between the special education and social models approaches to inclusive education ([Oliver and Barnes, 2010](#)), the Salamanca Statement of 1994 states:

every child has a fundamental right to education, and must be given the opportunity to achieve and maintain an acceptable level of learning, ● every child has unique characteristics, interests, abilities and learning needs, ● education systems should be designed and educational programmes implemented to take into account the wide diversity of these characteristics and needs, ● those with special educational needs must have access to regular schools which should accommodate them within a child-centred pedagogy capable of meeting these needs, ● regular schools with this inclusive orientation are the most effective means of combating discriminatory attitudes, creating welcoming communities, building an inclusive society and achieving education for all; moreover, they provide an effective education to the majority of children and improve the efficiency and ultimately the cost-effectiveness of the entire education system.

UNESCO (1994, Salamanca Statement, p. 1).

In this Statement, although its focus is on people with disabilities and special needs, it points importantly to diversity and “uniqueness” as part of people and the recognition thereof is necessary for “building an inclusive society”. This viewing of people’s diversity as necessary for inclusivity forces seeing diversity and inclusivity as more than referring to “race” and culture; and, in the case of inclusive education as more than just dis/ability.

Within inclusive education [Oliver and Barnes \(2010\)](#) note that the influence of critical theory, and its links with emphasis on transformation and emancipation were crucial in expanding the understanding of diversity and inclusivity. In inclusive education, the influence of critical theory has been significant in arguing for non-reductionist forms of analysis and to recognize the multiplicity of ways in which people are excluded, either directly or indirectly, from accessing social goods they are entitled to, in this case from education. Inclusive education, then began to develop a social model approach to inclusive education which included people with disabilities but also included people who are raced, gendered, classed, have different sexual orientations and ages, and so on. The social model of inclusive education argued that all people, no matter who they are, should have equitable and just access to education to allow for their own development. This is also captured in the South Africa White Paper 6 ([DBE, 2001](#)) which is the policy for inclusive education in South Africa. In White Paper 6, the notion of barriers to learning is put forward, and it indicates that it is not only people with disabilities who experience barriers to learning, but other people too. These other people include people who experience barriers to learning due to “race”, class, gender, region, age, etc., while still acknowledging the barriers to learning that people with disabilities experience.

There are two important issues that emerge from this. One is the recognition that people have multiple identities which need to be recognized and which are in fact contained in the Bill of Rights and/or the Universal Declaration of Human Rights. Secondly, it also indicates that for inclusive education, and thereby also inclusivity, to be realized it is crucial to recognize all such identities that constitute people. One cannot only recognize gender, for example, and not also look at class, region, language, religion, etc. This is important because the developments in inclusive education, and consequently the development of inclusivity, is that it is counterfactual to suggest that people are only one identity, and that they can be essentialized in terms of that identity. Instead, what this development points to is the importance of recognizing the multiplicity and complexity of people’s identities, and the crucial need

to move away from reductionist tendencies which promote the idea that people can be defined in terms of one single thing, and their senses of self and being can be reduced and fixed in these ways.

Diversity, then, as [Vertovec \(2015\)](#) indicated and quoted above, is now more than just a matter of “race” relations. It is about the multiplicity and multi-layered identities that people possess, and that this is crucial for a development of inclusivity, in inclusive education or for the development of an inclusive society and an inclusive world. The importance of this recognition is now also acknowledged by the Sustainable Development Goals—SDGs—of the United Nations ([UN, 2015](#)) and recently by the World Economic Forum—WEF—(2021), where it is noted that for a sustainable future a move toward a more inclusive world is critical, and this inclusive world should include all people in terms of the multiple and complex identities they possess individually and collectively.

Goal 8 of the SDGs states “Promote sustained, inclusive and sustainable economic growth, full and productive employment and decent work for all”. Goal 9 states “Build resilient infrastructure, promote inclusive and sustainable industrialization and foster innovation”, and Goal 11 states, “Make cities and human settlements inclusive, safe, resilient and sustainable” ([UN, 2015](#)). The [WEF September \(2021\)](#) Briefing Paper uses the word “inclusive” in its vision of a future sustainable and equitable and better future for all.

Diversity then has morphed into inclusivity. However, the basic argument about inclusivity is the recognition of difference. This means that inclusivity acknowledges that people are different within themselves and in relation to others. It is important to elaborate on how difference is crucial for understanding inclusivity.

Difference

Difference is not a simple matter. It is not simply saying that all people are different. Difference is an ontological and epistemological claim, and it is important to understand difference in these terms ([Carrim, 2018](#)).

Difference ontologically

Ontologically, it is important to understand that difference is brought into play the instance when an identity emerges. A thing becomes what it is the instance it separates itself from all other things to become an individual entity. Nothing can be said to exist if it is not distinguishable from other things. If it is not distinguishable from other things, it becomes the same as other things since there is no distinction between it and other things. A tree is not a river, for example, because the tree separates itself from a river in order to be a tree. As another example, a child separates itself from its mother at birth to become an individual in its own right. The ontological basis for all things to come into existence as an entity of its own, thus, depends on separating itself from all other things, distinguishing itself from others and being different from all else.

Identities, then, come into existence because they differentiate themselves from all other things to become what it is. Identities, by definition are rooted ontologically in difference.

It is also important to note that once an identity comes into existence it does not remain the same. It changes, it grows, it develops. In this regard, identities are fluid and change all the time. Identities, then, come into being and they change once in existence. Being then is also simultaneously about becoming ([Nietzsche, 1968](#)).

The implications of recognizing difference ontologically are significant. Three such implications will be dealt with here: (1) social categories; (2) dominance of particular forms of identity; and (3) importance of multiplicity within and across people.

Recognizing difference within social categories is significant because it throws light on the unhelpful and counter productive categorization of people in terms of social categories. For example, to simply view women as women fails to consider that there are different ways in which women experience and define themselves as women. Women who are “black” do not experience being women as a “white” woman does, neither does a working-class woman experience being a woman as a middle-class woman does, nor does a rural women experience being a woman as an urban woman does. To homogenize and essentialize all women in terms of the social category of women is, thus, problematic if not short-sighted and counterfactual. Women may be distinguishable from men, for example, but it is erroneous to suggest that all women are, therefore, the same.

Critical theory and postmodernist forms of thinking have highlighted the importance of recognizing difference within social categories, and have, thus, argued for intersectionality ([Hall et al., 1992](#)). Intersectionality connects social categories to demonstrate the multiplicity and complexity of the forces that impact people. A woman, with intersectionality, is a woman who is also classed, raced, with different sexual and political orientations, lives in different regions and is of different ages and ability. The same holds true for other social categories too.

One could ask why, then, do particular forms of identity or social category become dominant. There are two ways in which one could respond to this. The first is to suggest that particular forms of identity or social category become dominant because in specific country contexts particular configurations of power emphasize one form of identity or social category over others because it is the basis for ideological construction and public imagination of those who are in political and economic power. In Laclau’s and Mouffe’s (see [Snir, 2017](#)) terms it is a dominant articulating principle. [Mamdani \(2018\)](#) indicates this as the specific configurations of power in particular country contexts.

The second response to why particular forms of identity or social category become dominant is because of ideological constructions which create imaginary senses of belonging uphold and perpetuate hegemonic orders. [Hall et al. \(1992\)](#) put it in the following way:

Within us are contradictory identities, pulling in different directions, so that our identifications are being continuously shifted about. If we feel we have a unified identity from birth to death, it is only because we construct a comforting story or 'narrative of the self' about ourselves. The fully unified, completed, secure and coherent identity is a fantasy.

[Hall et al. \(1992: 277\)](#).

Following on [Hall et al. \(1992\)](#), it can be said that dominant articulations of particular forms of identity or social categories are a result of political and ideological machinations which construct narratives that chimerically project some identities and social categories as more important than others and do so by silencing and invisibilizing other forms of identities and social categories which although deep in people's experiences get ignored. Such constructions are fantasies and construct comforting narratives of self (where self can be individual or collective).

Difference epistemologically

If one accepts that people are different and they are constantly in a state of becoming it follows that people will have different views and understanding of themselves, others and the world, and these views and understandings will change too. Knowledge/s that people have are, however, not what characterizes dominant world views. Instead, coming from colonized people and women and black people, as well as people from different religions and different forms of sexual orientations and dis/abilities are marginalized or ignored. Whose views dominate and how knowledge is viewed, then, become an important question.

Writing from the context of the United States of America [Apple \(2018\)](#) elaborated extensively on how dominant ideologies inform knowledge systems in the world, especially in school curricula. Apple noted that "white", European, and Western, heterosexist, male and Christian views dominate knowledge systems. The views of "the other" are either illegitimized, marginalized or simply ignored. This is also promoted widely by media, and do not only happen in schools. The impact of this is that it suggests that Western, European, "white", Christian, heterosexist and male views are correct and better than "other" worldviews. [Visvanathan \(1997\)](#), writing from an Indian perspective and on the basis of experiences of colonialism, describes this as "cognitive injustice", [Bourdieu \(1976\)](#) in looking at experiences of the working class in Algeria, described it as "symbolic violence" and [Spivak \(1988\)](#), also writing from an Indian perspective and from experiences of colonialism described as "epistemic violence". The point that is made by all of them is that when dominant knowledge systems legitimize themselves by illegitimizing "other" worldviews and knowledge systems it creates violence on the "other", and erroneously (perhaps even deliberately) projects its own knowledge system as "the truth".

Although there is no space in this chapter to engage with the many and complex arguments about truth claims which have preoccupied philosophers over the ages, it is important to clarify that an epistemology that recognizes difference is not necessarily equal to saying anything goes, and all views are valid. All views no matter what they are or where they come from need to make sense, that is they need to be logical and the argument they put forward needs to be coherent. The importance of articulating views in logical and coherent ways is argued by [Nietzsche \(1968\)](#) and by critical realists ([Sayer, 2000](#); [Potter and Lopez, 2001](#)). [Nietzsche \(1968\)](#) pointed to the importance of logic and argument, [Sayer \(2000\)](#) and [Potter and Lopez \(2001\)](#) argued that although epistemological relativism is important to consider there is still a way in which judgmental rationality can be exercised which can interrogate the basis on which claims are made, whether they make logical sense, are coherent in their argument, and if evidence is provided in sound ways to support claims made. In this light, then, it is important to realize that an epistemology of difference does not mean that any view, no matter how incoherent and illogical it may be, should be accepted.

[Spivak \(1988\)](#) points to another important dimension to releasing what she calls subjugated knowledges. Subjugated knowledges are those knowledge forms that have been illegitimized in the construction of dominant knowledge systems. Spivak in looking at the practice of "sati/satee" in India shows that when subjugated knowledges are released, they may not lead to more forms of inclusivity or justice. They may in fact reinforce dominant knowledge systems. Sati which is a ritual in India where a widowed woman will place herself on the pyre on which her recently deceased husband is being cremated, allows herself to burn herself alive because it is believed that she is of no worth if without a husband. Spivak shows that this ritual is deeply embedded in traditional, indigenous knowledge systems and argues that if such views are rearticulated as a way of resisting dominant knowledge systems, it will have drastic and damaging consequences for the struggles of women to emancipate themselves from gender and sexual oppression. The reason why this account of sati by Spivak is important is that it points crucially to the importance and need of interrogating all knowledge systems and to evaluate the extent to which they do or do not assist in recognizing difference among people, and how they assist in recognizing the equality of all human beings, rather than putting into place re/configurations of unequal and unjust systems of dominance and subordination.

Inclusivity, then, entails difference, and it is important to view difference in ontological and epistemological terms which considers the multiplicity and plurality of being human as well as the varied and varying ways in which human beings make sense of themselves, others, and the world. Such knowledge system upon which human beings understand themselves and their world may be relative, but they need to meet the conditions of logic, coherence of argument, and supporting claims made, for them to enter meaningfully into dialogs with other knowledge systems in order to arrive at a better understanding of phenomena.

Toward a more socially just world

This chapter has focused on the diversity and linked it to inclusivity and difference. Drawing on the South African experience of apartheid, it has shown that diversity could have profoundly negative consequences. What diversity is understood to mean, how it is framed, and the implications it has need to be understood and not be taken for granted.

It has been argued that diversity has historically been linked to questions of race relations. In so doing it has meant and been framed as referring to recognition of different “races” and ethnic or cultural groups. The apartheid experience in South Africa showed that this could be used in ways that segregate people in racist systems which is based on inequality. Although, the post-apartheid South Africa recognizes diversity in positive terms and in its Constitution as does the United Nations Universal Declaration of Human Rights, which recognize diversity on the basis of human rights and equality, the dominant view of diversity remains couched in racial, ethnic, and cultural terms.

It has also been argued the diversity has developed as linked to inclusivity. With the influences of critical theory, postmodernism and critical realism, the importance of moving away from reductionist forms of thinking that tend to homogenize and essentialize people’s senses of themselves and which lapse into mono-causal explanations. It has been pointed out that multiplicity, plurality, and difference are crucial to consider. In this regard, it has been demonstrated that viewing people as having multiple and multi-layered aspects to their own selves and in relation to others, and the ways in which different aspects of themselves intersect with each other is crucial. Inclusivity was shown to recognize that diversity is not only about race, ethnicity, or culture, but also about gender, class, region, sexual and political orientation, etc. Such complexity and multiplicity of human beings and their contexts broaden the meaning and frame of diversity.

Inclusivity was also shown to imply difference. In this regard, it has been argued that difference, if viewed ontologically and epistemologically, provide a useful way to take forward diversity and inclusivity so that they can speak to the complexities and multiplicities that have come to the fore in postmodernist conditions and in the 21st century.

The suggestion made in this chapter is that difference, more than diversity, may provide a more useful way in which to recognize the plurality of dimensions that characterizes human beings’ own senses and experience of themselves, in their relations with others and the world. For a more sustainable future that is based on inclusivity, it has been suggested that working with and through difference may be more useful than holding onto diversity, which due to its historical connotations and meaning, have tended to function ideologically to not bring into focus the systemic, institutional, and systematic ways in which systems of domination and subordination are reproduced. Moving toward more socially just and sustainable futures require justice for all on the basis of equality, not just in terms of race, ethnicity, and culture, as diversity implies. Justice for all in a socially just order of the future will need to engage with the complexities, multiplicities and difference that exist within people, between people and the world. Recognizing and working with difference in constructive and productive ways, it has been argued, is needed to move away from reducing and fixing people into one or another social category or narrative which strip people of the complex beings that they are and the equally complex world that they inhabit.

Introduction

Democracy is simultaneously an ancient idea and an unfinished experiment in social and political governance. Although the Athenians are generally credited with conceiving of the notion of δημοκρατία (democracy)—by which the people (δῆμος; demos) ruled (κρατία; cracy) the polis—there have been different forms of democracy that have arisen ever since people first formed together in communities. Despite its ubiquity as a political form and an ideal of collective commitment to civic engagement, democracy has long been criticized for its shortcomings. For example, Plato (2007) famously railed against the failings of Athenian democracy in *The Republic*, claiming that it enabled tyranny by the mob through which base impulses drove decisions, rather than a commitment to the common good of the polis. However, Churchill (2008) countered that “no one pretends that democracy is perfect or all-wise. Indeed, it has been said that democracy is the worst form of government except for all those other forms that have been tried from time to time” (p. 574).

Despite its long history as a mode of social and political organization, democracy remains a contested concept, which “is at the center of struggles over what the goals of education should be” (Apple, 2011, p. 23). Since American pragmatist philosopher, John Dewey wrote about democracy and education more than a century ago, the two have been intimately entwined in debates about the purpose of schooling and other sites of education in preparing young people for the world. Dewey (1916) argued that “democracy is more than a form of government; it is primarily a mode of associated living, of conjoint communicated experience” (p. 101). Through democracy, people are able to realize the full potential of their collective interest and break down social barriers such as class, race, and gender. However, “democracy is not something out there waiting to be reached. Rather it is in the work itself as we create ways to promote human dignity, equity, justice, and critical action” (Beane and Apple, 2007, p. 25).

In his writings on education and democracy, Dewey (1899) argued that schools should provide the opportunity for all young people to be educated into the democratic practices and social belonging of the community. He claimed that “what the best and wisest parent wants for his own child, that must the community want for all of its children” (Dewey, 1899, p. 19), through a balance between individualism and socialism. In the contemporary policy landscape of neoliberalism, in which the individual reigns supreme over any concern for the collective good, such a sentiment stands in stark contrast to the educational realities of many young people who are disenfranchised and marginalized due to their skin color, sexual orientation, religious or spiritual beliefs, cultural histories or socioeconomic status.

Mouffe (1993) argued that “far from being the necessary result of a moral evolution of humankind, democracy is something uncertain and improbable and must never be taken for granted. It is an always fragile conquest that needs to be defended as well as deepened” (p. 6). This chapter seeks to provide an understanding of the relationship between education and democracy, given the complex set of contemporary challenges that face young learners in the 21st century. In doing so, this chapter argues that we—educators, researchers, policymakers, parents, learners, and community members—should work toward an education that is for democracy.

Democratic education is not simply an educational ideal, it is also a deeply political commitment to a collective ethics of responsibility to each other (Gutmann, 1999). In the social order, there is little more important than the nurture and education of the young. As Dewey (1916) claimed, “each generation is inclined to educate its young so as to get along in the present world instead of with a view to the proper end of education: the promotion of the best possible realization of humanity” (p. 111). Democratic education is not interested in the simple maintenance of the status quo, but rather in the active reconfiguration of society to be more inclusive and embracing of all, especially those who are marginalized and disenfranchised.

However, as Carr (2011) maintained, “the problem is not that democracy is not a worthy concept but, rather, that the type of democracy that has received normative, relativistic salience is, in many regards, anti-democratic” (p. 4). Contemporary liberal democracies act as little more than fronts for corporate oligarchies and massified individualistic consumerism (Rancière, 2006), in which the *thick* version of democracy gives way to a commodified *thin* version of democracy writ small as *choice* (Apple, 2018), whether via an electoral experience that provides little, if any, differentiation between political candidates, and market-driven product consumption and individual competition, which leaves little time for the consideration of public life and its concerns for the welfare of others.

There is an argument that neoliberalism has fostered a thin version of minimalist democracy, in which exclusion is the prime function of contemporary social, economic, and political discourses, which “depends not only on the predominance of the economic in the political arena but also on an elitist conception of citizen participation (electoral, sporadic and easily manipulated by spectacle and demagoguery)” (Szolucha, 2016, p. 20). However, it does not need to be so. Indeed, as Biesta (2014) claimed, democratic possibility enables the rethinking of democratic ideas, subjectivities, and configurations in different ways, and that the treatment of democracy “as an ongoing and never-ending experiment is a way to capture this idea” (p. 6).

Contemporary challenges for democracy and education

The first two decades of the 21st century have ushered in an era of intense crisis for democracy and education. There are complex and interconnected challenges that have emerged, which threaten the foundations of liberal democratic societies. Despite the argument in the late-twentieth century that globalized liberal capitalist democracy had triumphed over all other political and economic forms, culminating in the “end of history” (Fukuyama, 1989), there has since been a rapid fraying of democracy around the world. This can be observed in the rise of neofascist populism in many countries, including the US, Brazil, and Turkey. As Moffitt (2016) contended, “populism is back—and it is back with a vengeance. What was once seen as a fringe phenomenon relegated to another era or only certain parts of the world is now a mainstay of contemporary politics across the globe” (p. 2).

The rise of alternative facts, fake news and rightwing extremism has posed a significant challenge to the democratic practices and public institutions of many countries. This can perhaps best be observed in the phenomenon of Trumpism, a four-year experiment in demagoguery, which culminated in claims fueled on social media and by Trump himself that the 2020 US Presidential election was stolen by Biden and the Democrats. Gardels and Berggruen (2019) warned of the increasing deleterious effects on civic discourse from growing spread of misinformation, arguing that “despite expectations that the Internet Age would create an informed public more capable of self-government than ever before in history, fake news, hate speech, and ‘alternative facts’ have seriously degraded the civic discourse” (pp. 2–3).

At the same time that democracy as a form of political order is rapidly unraveling in liberal capitalist democratic societies, growing social and economic inequality pose additional risks to social cohesion. There are shocking wealth disparities between the elite and the general population in countries that for much of the twentieth century prided themselves on egalitarianism and equal opportunity. The myth of meritocracy has been laid bare through the rapid stripping out of the middle-class and the accelerated growth of the underemployed and unemployed as a disposable surplus population (Srnicek and Williams, 2016). Billionaires fire themselves into space, while millions live with the daily threat of malnutrition and starvation. Dorling (2019) argued that the top 1% “contribute to rising inequality, not just by taking more and more, but by suggesting that such greed is justifiable and using their enormous wealth to promote that concept” (p. 22).

Runaway climate change continues apace, while governments and other political, social and economic institutions seem unable or unwilling to address the urgency of the need to rapidly decarbonize and decouple from energy reliance on fossil fuels. The powerful oil lobby, buoyed by a dependent globalized economy and compliant governments, continues to wreak havoc on the natural systems of this finite planet. It is a poorly kept secret that powerful corporate and political “elites see equality as a danger” (Schostak, 2019, p. 1103), and as such, consider democracy itself to be a threat to their continued privilege and power.

The first couple of years of this decade have seen political, social and economic systems entirely overwhelmed by the challenges posed by the COVID-19 global pandemic. Entire economies ground to a halt, widespread restrictions on freedom of movement were imposed, relaxed, and imposed again. Those who had the material and cultural resources to do so, bunkered down safe in the knowledge of having access to supplies and high-speed internet connections to ensure a smooth transition to home-based working and learning. At the same time, those already in precarious situations found that the ground had given way, without adequate access to shelter, food and healthcare. Even a working internet connection became a necessary condition of daily engagement with the worlds of work and education. For many millions, such luxuries were simply not available to them. It is no coincidence that those who were hardest hit by the pandemic were the working poor, those living with disabilities, and other vulnerable and marginalized groups in society. The pandemic has increased the pace of wealth distribution toward the few wealthy elites, while many continue to suffer the consequences of predatory capitalism, globalization and increased precarity, to say nothing of the enormous toll of the global COVID-19 public health crisis.

At every stage, with every challenge, democratically elected governments have failed to adequately respond in meaningful ways. Trust in governments and public institutions continues to wane, as people live with the daily realities of rising inequality, social instability and political corruption (Dorling, 2019). The rise of populism is one effect of a situation that seems inescapable; people cry out for the strongman to do something, anything, to fix the problem. However, history has shown multiple times over that populism, particularly the militarized, rightwing version that appears to be taking hold in many supposedly liberal democracies, never ends well for the people who support its rise.

Rapid changes in technology also pose a significant challenge to democracy in the 21st century. Bloom and Sancino (2019) argued that smart technologies (e.g., robotics, artificial intelligence, social media, automation, and the internet of things) are disrupting politics and economics around the world, with the effects on democracy and education yet to be realized. They warn of the potential for technological advances to intensify inequality and the concentrated power and wealth of a globalized corporate elite, while also suggesting that there is potential for the radical transformation of “democracies and civic societies, creating ones that are more responsive, egalitarian and accountable” (Bloom and Sancino, 2019, p. 5).

Democracy and education as neoliberal commodities

Much of the contemporary policy landscape is underscored by the mantra of neoliberalism, which turns everything—including education and democracy—into markets, then seeks to make those markets wider (Connell, 2013). The defining characteristics of neoliberalism are competition, individual choice, and free markets. Citizens are recast as consumers, who make choices within markets whether that be for education, work or purchasing goods and services. The rapid globalization of capital—human and economic—since the 1980s has driven neoliberal policy thinking into most corners of the world. Some of the largest supranational institutions have their main goal to support and perpetuate neoliberal ideals, including the World Trade Organization, the World Bank, and the International Monetary Fund.

Rancière (2006) argued that in contemporary capitalist societies that purport to liberal democratic modes of governance, democracy has been co-opted within the formation of modern society as the “apolitical life of the indifferent consumer of commodities” (p. 29). Further, Rancière (2006) claimed that mass individualism and oligarchic interests drive the forms of subjectivation within contemporary democratic societies, in which democratic passions are redirected toward private pleasure and people are encouraged to disengage from public life. Democracy is reduced to the possessive individualism of the citizen as consumer, which has implications for de-racing, de-classing and de-gendering issues of injustice and inequality, which are reframed as individual problems rather than social justice issues (Apple, 2006).

McLaren and Farahmandpur (2005) argued that neoliberal reforms over the past several decades have weakened social support structures such as public health and education, undermining social justice and the collective and individual rights of people to engage in meaningful work and education. Instead, the power of corporate oligarchs has eclipsed the democratic sphere, where international corporations have more economic and political power than democratically elected governments. Perhaps the most perverse outcome is the corruption of democratic processes to the market, in which the election cycle becomes one more carefully controlled public relations exercise by corporate powers and the representatives of their commercial interests.

Giroux (2016) argued that “under the auspices of a diverse group of extremists, including political, religious, and market fundamentalists, political and educational culture is being transformed into the discourse of privatization, consumerism, market-based choice, the spectacle of celebrity, and the revived ethics of social Darwinism” (p. xxvii). Neoliberalism recasts education as “human capital formation”, through which students learn the skills and attitudes to be productive members of a globalized workforce, which produces increasing profits for the market economy (Connell, 2013). Democracy and education is reduced to the simple notion of choice in the education marketplace, in which parents and their children make decisions about where they will get the best return on their investment. It is particularly visible in the influence of corporate interests, such as those which “provide for-profit education in the form of ventures such as online charter schools, marketed to parents as a more democratic, personalized and accessible educational opportunity for their children” (Riddle and Heffernan, 2018, p. 321).

Further, neoliberalism works to ensure a thin, marketized and commodified version of democracy, which promotes possessive individualism and competition, rather than a fuller democracy, which enables collective participation and critical engagement with society’s institutions and public decision-making apparatuses (Apple, 2013, 2018). While liberty and equality have always been understood as necessary elements of democracy, contemporary neoliberal formations have skewed democracy “toward a particular understanding of individual liberty at the expense of social equality” (Szolucha, 2016, p. 23).

Even liberty and individual freedom become reduced to a superficial form of choice in a market in neoliberalism, stripped of its emancipatory politics and ethics. Monbiot (2016) claimed that “freedom of the kind championed by neoliberals means freedom from competing interests. It means freedom from the demands of social justice, from environmental constraints, from collective bargaining and from the taxation that funds public services. It means, in sum, freedom from democracy” (p. 12).

Biesta (2014) warned that “by replacing democracy with choice, by letting the logic of the market into the public domain, and by giving up on the idea that democracy is ultimately about transformation, the possibilities for the enactment of democratic citizenship begin to disappear” (p. 9). The weakening of democratic practices and opportunities for people to meaningfully engage with each other in public spaces and working toward the common good enables what Schostak and Goodson (2020) described as the *propaganda society*, which relies on a compliant and acquiescent public that is educated according to the desired outcomes of the elites, rather than a democratic mode of education that produces critical and creative citizens who can work together in multiple ways to ensure a rich, sustainable society.

Apple (2006) argued that public institutions should sit at the heart of caring, inclusive democratic societies. As such, capitalist market relations should support and extend democratic institutions to ensure “a fuller and thicker participatory democratic polity and daily life” (Apple, 2006, p. 103). However, a functioning democracy requires an educated citizenry (Carr, 2020), whose capacities for critical engagement and participation are supported by their education, which enables the sharing of diverse perspectives within an inclusive society.

The question is, “can normative, hegemonic democracy effectively grapple with social inequalities? Neoliberalism, tightly controlled elections offering few options, and an educational system that is structured more for the job market than social justice appear to be obstacles” (Carr and Thésée, 2019, p. 245). What are viable alternatives to normative, hegemonic democracy as it is currently shaped by neoliberal policies within globalized capitalism? Is it possible to ensure a more transformative education that supports meaningful democracy, especially for peoples who are presently marginalized and excluded from substantial engagement and participation in society? One approach to conceptualize potential solutions to the challenges facing education and democracy in the 21st century is to consider the multiple ways in which education can be *for* democracy.

Toward education *for* democracy

There is little doubt that education is dangerous (Connell, 2012), not only to totalitarian and authoritarian regimes, but even to the powerful elites within supposedly democratic states in the contemporary globalized and interconnected world. Similarly, democracy is viewed not only as a dangerous concept, but even more so, a dangerous practice (Riddle and Apple, 2019). As Rancière (2006) argued, those in power have a vested interest to hold democracy at bay, to restrain the impulse of the masses to collectivize and work toward a common good. How quickly it would become evident that capitalism's production of a minority wealthy elite and a majority of people living at or just above subsistence levels is an unsustainable proposition for a healthy, functioning society. While billionaires jaunt into sub-orbital space, millions of people live in conditions unworthy of the term "living". Corporate greed and a compliant political class ensure that the destruction of natural ecosystems continues unabated, despite the clear and present threat of climate change. Unsurprisingly, the working poor, unemployed, disadvantaged, marginalized, and those cast aside by society are the ones most at risk of displacement and dispossession in the coming years as rising sea levels, increased extreme weather events and reduced arable land and drinkable water begin to take their toll.

Given the challenges facing societies in the 21st century, what could and should be the role of education in preparing young people for a changing world with complex problems that require new ways of thinking, working, learning, and living together? An education that is for democracy can provide young people with the critical and creative capacities to engage in collaborative and collective responses to these complex challenges. Education must sit at the center "of our efforts to reconfigure the social apparatus in more equitable and socially just ways, for both the sustainability of our communities and the planet" (Riddle, 2019, p. 3).

Giroux (2010) argued that education is never neutral because it attempts to teach young people to "inhabit a particular mode of agency, enable them to understand the larger world and one's role in it in a specific way, define their relationship, if not responsibility, to diverse others, and experience in the classroom some sort of understanding of a more just, imaginative, and democratic life" (p. 718). An education that is for democracy recognizes that young people's agency in the world depends on their interrelations within societies, but also importantly within ecosystems and the finite planet upon which we all rely for our continued existence.

The search for a more democratic society through education "is tantamount to seeking the truth. Never comfortable, nor easily achieved, such a proposition requires a multitude of measures as well as the belief that people can, ultimately, function together without self-destruction" (Carr, 2011, p. 262). Additionally, radically inclusive forms of education, which bring people together in communities of learning, enable a rich diversity of perspectives, voices, and understandings to be included in the formation of multiple democratic spheres of being and belonging (Schostak, 2019).

Neither democracy nor education are ideal in their conception and practical realization, but that is no reason to decide that they cannot work more fully toward the realization of an inclusive and caring society (Gutmann, 1999). Apple (2011) claimed that democratic education is not simply about education, but at its core regards the kind of society we want and the politics that might help us achieve those ends. Similarly, Carr (2020) argued that our present context of multiple political, economic, and public health crises requires us "to re-imagine a more meaningful, critically engaged democracy" (p. 4). Education provides an important site of preparation for engagement in such meaningful democratic practice.

While schools and other sites of education can be co-opted into the existing power relations of contemporary neoliberalism—with public schools producing compliant workers for a globalized marketplace and elite private schools producing future political and corporate leaders—clearly, it does not have to be this way. There are many examples of educators, students, their families, and communities engaging in collective acts of resistance and reimagining education in local and global contexts (e.g., Apple, 2018; Riddle and Apple, 2019; Riddle et al., 2021). These multiple and varied enactments of democratic modes of living together offer all of us hope for a future that is more sustainable, inclusive and caring, especially for those who are least advantaged by the present system.

There are multiple examples of youth-led movements through which young people have agentic expression through political resistance, civil disobedience and the reclaiming of schools and other sites as democratic spaces as part of a public pedagogy (Brady, 2006; Giroux, 2003, 2004). The aim of such grassroots democratic mobilizations is not to cause anarchy or destabilization, but to reimagine public institutions, power and politics in more democratic ways (Mouffe, 2019). The Occupy movement provides a key example of radical democratization through acts of sustained public resistance to neoliberalism and corporate control of public institutions (Amsler, 2015; Szolucha, 2016). Similarly, the School Strike for Climate movement demonstrates the potential power of democracy by young people, who are usually excluded from the spheres of political and economic influence (Mattheis, 2020). There are many other examples of both localized and globally active youth-led movements, which have galvanized around issues of gender and sexuality, diversity and inclusion, racism, gun control and climate activism. Each democratic movement and act of public pedagogy represents an important commitment to reimagining democracy in ways that are more inclusive, sustainable and representative of diverse communities.

However, these acts of engaged reimagining of education and democracy need to be underwritten by much wider societal and institutional reform at the systemic level. Otherwise, the complex array of challenges posed by rising social and economic inequality, increasing social unrest and destabilization, political extremism and the influence of misinformation, fear, distrust, and hate, alongside the calamitous effects of catastrophic climate change, corporate environmental vandalism, and ecosystem collapse, will make such efforts pale against the enormity of the task. An education that is truly for democracy in the 21st century requires a radical reimagining of the processes, power relations and institutional structures, right down to the foundations of liberalism, capitalism, and democracy itself. The stakes are simply too high to do otherwise.

Contemporary debates pertaining to social justice and education remain a major concern among educators advocating for equitable education. We maintain that the moral and political urgency of arguments related to social justice and education arises, ironically, in the absence of social justice in and through formal education systems. Scholars and policy makers, educators and community activists are motivated to theorize about social justice in order to understand and then challenge injustices. Debates about social justice and education are thus rooted in a normative desire to challenge unjust relationships (or inequities) while creating right relationships in and through formal education systems.

Unlike legal justice focused on the individual rights-bearing persons and associated juridical remedies, social justice is concerned with morally and politically desirable social relationships writ large. The satisfaction of individual rights to education through the juridical system may thus be part of but is not commensurate with social justice in education, which depends on just relationships more than the realization of individual rights. Socially just education thus counters unintentional and structural reproduction of inequities (Young, 1988: 272–265). Yet theories of social justice in education are sufficiently diverse and contested that even this capacious conceptualization of social justice may be challenged, notably by those who anchor their understandings of a socially just education system in the ethical stance “that individuals are the ‘primary objects of moral concern’” (Brighouse and Swift quoted in Walker and Unterhalter, 2007: 2). A central aim of this contribution is therefore to explore debates about what social justice is and how these inform varied understandings of socially just education systems.

To those ends, we first conceptualize social justice theorizing from above and consider how three influential Western philosophical arguments about social justice have informed understandings of what socially just education does (or should do). Next, we turn to intellectual traditions from below that emphasize the necessity of theorizing historically specific injustices in education, especially class inequities, racisms and colonialism, rooted in insights gained from the lived experiences of the most marginalized and racialized individuals. Then, we briefly consider some arguments against socially just education from the left and from the right, before concluding with a brief survey of contemporary concerns about social justice and education in our times.

Theorizing social justice and education from above

Twenty years ago, Gewirtz (1998) expressed concern that social justice is under-conceptualized in education policy discussions, even among those who emphasize their commitments to social justice in education. Although there continue to be expressions of concern that social justice is a “*feel good*” concept, where the affective appeal disguises a lack of theoretical precision (Brennan and Naidoo, 2008: 287, italics in original), today, Gewirtz’ observation is much less true. Instead, as Wilson-Strydom (2015: 144) argues, there is recognition that “it is necessary to interrogate the notion of social justice, what it means, and why it is helpful in understanding inequalities in a[n] ... education context.”

Thus, theorizing the relationship between social justice and education (or in education) is often explicitly situated within broader Western philosophical debates about justice and what social justice entails and demands. In particular, theories of justice respectively elaborated by Rawls (1972) concerning questions of distribution, by Young (1990) and Fraser (1995), concerning questions of difference, and by Sen (1993) and Nussbaum (2011), concerning capabilities, have been influential in theorizing social justice in education (for instance, Bell, 2016; Eisenberg, 2006; Nussbaum, 2006; Polat, 2011; Vincent, 2003; Walker and Unterhalter, 2007; Wilson-Strydom, 2015; Zajda et al., 2006).

Contemporary Western philosophical theories of social justice have traditionally been concerned with questions of the fair distribution of goods, where liberal philosopher Rawls’ has offered the most influential account of distributive justice (1972).¹ Following Rawls’ emphasis on “conditions of fair equality of opportunity” (Rawls cited in Taylor, 2004: 334) and granting that education is itself a good, the question for educators concerned with social justice as distribution is then “who gets its benefits?”

¹Explorations less frequently turn to classical as well as contemporary philosophers. Zajda et al. (2006: 9) briefly invoke Plato, Aristotle and Aquinas, for instance, in thinking through diverse, Western philosophical conceptualizations of justice and their implications for socially just education.

(Connell, 1993: 12) or alternatively stated, who has the right to education? (Connell, 1992: 133–5; Gewirtz, 1998: 470–471). Benefits are understood as immediate (since education is a good in itself) and as leading to other benefits (like better-paying jobs for the educationally credentialed). Consequently, studies concerned with social justice as a question of distribution often focus on the availability of education, as well as who has access to an education and educational certification and who doesn't (Oduaran, 2006). Ultimately, the broad or universal availability of education and access to education are taken to be a measure of a just society, or, as one United Nations' publication emphasizes, "the availability of educational opportunities and ensuring the ability to take advantage of them is a fundamental component of any equitable community" (Matsuura, 2006: v).

The distributive justice approach to education informs normative arguments in favor of universal access to education, as well as empirical studies assessing access to education, like graduation rates at high school or university by gender, race and/or class. Nationally-focused studies of distributive justice in education, for instance, assess Black students' "access and ... fair chance of success" in higher education in post-apartheid South Africa (Sehoole and Adeyemo, 2016), inquire into access to post-secondary education in the province of Ontario, Canada by historically underrepresented Black, Latino and South Asian youth (James and Parekh, 2021), and consider the availability of early childhood education to disadvantaged (low-income) families in Chile (Barco and Carrasco, 2020). A characteristic question that scholars of education concerned with distributive justice seek to answer is thus: "Who goes to university [or elementary or secondary school], and do all have an equal chance to attend?" (Weingarten, 2021: 30–43). Often, there is a particular concern for the most disadvantaged, drawing on John Rawls' argument that measures of distributive justice should support the "least favored" (Connell, 1992: 139–40; Giroux, 2003: 10; Taylor, 2004: 334).

Other scholars concerned with social justice in education challenge an exclusive focus on the distributive dimension of education, understood as a good. In so doing, they follow theorizations of justice as demanding recognition, put forward by philosophers Iris Marion Young (1990) and Fraser (1995), among others (Huttunen and Heikkinen, 2004). As Eisenberg (2006: 9) observes, this approach is motivated by "the concern ... that, as important as universal accessibility to education (or any other public good) is, it is not, by itself, enough to ensure that all individuals are treated justly by institutions or, in the case of education, that the system is doing its utmost to secure social justice." Instead, justice demands a politics of distribution *and* recognition, notably including the positive recognition of cultural differences in the school or university classroom (Vincent, 2003: 3–4). Arguments here emphasize that educational content must be "inclusive", "diverse" and "multicultural", responding to the principle that socially just education recognizes cultural differences as valuable (Connell, 1992: 139). The question is not only access to education but to an education that allows for the recognition of a range of cultural meanings, against what Young refers to as "cultural imperialism" (Young, 1990: 36) or the imposition of the standards of a particular culture as if these were universally desirable. This dual concern with distribution and difference is captured in conceptualizations of socially just education as challenging "inequities and marginalization" (Theoharis, 2010: 333); in other words, focused on redistributing resources, especially to the most disadvantaged, while also positively recognizing hitherto absented knowledges and cultures in the classroom.

As Eisenberg (2006: 8) explains, "a politics that welcomes difference" may be understood as one critical element in a broader politics that seeks to challenge oppression, along but not limited to dimensions of both (re)distribution and recognition. Drawing on Young's (1988) well-known analytical framework delineating "the five faces of oppression", Gewirtz (1998) then offers an expansive list of questions that *anti*-oppressive social justice educators must ask:

"How, to what extent and why do education policies support, interrupt or subvert:

1. Exploitative relationships (capitalist, patriarchal, racist, heterosexist, disablist, etc.) within and beyond educational institutions?
2. Processes of marginalization and inclusion within and beyond the education system?
3. The promotion of relationships based on recognition, respect, care and mutuality or produce powerlessness (for education workers and students)?
4. Practices of cultural imperialism? And which cultural differences should be affirmed, which should be universalized and which rejected?
5. Violent practices within and beyond the education system?" (Gewirtz, 1998: 482).

In this view, a socially just education counters exploitation, marginalization, powerlessness, and (as noted earlier) practices of cultural imperialism and violence. In so doing, socially just (here *anti*-oppressive) education seeks to transcend a range of historically and locally situated inequities, related to class, gender, race, sexuality, disability and more, as experienced by actors in formal education systems, including both educators and students.

Other scholars turn to philosopher Sen's (1993) "capabilities approach", as well as Nussbaum's (2011) further development of this perspective (Wilson Strydom, 2015) to establish right relationships in education systems. For Sen, justice demands the enhancement of individual capabilities, so that each person may become and do in ways that are meaningful in their own critical self-evaluation (Sen, 1979). The question is thus less concerned with distribution and more focused on functional abilities, a matter of "asking the question 'what can people do?' (rather than how much do they have)" (Terzi, 2005: 387). From this perspective, socially just education supports children, youth and adults in developing the capacities they need to freely "choose and ... achieve" the ends each individual values (Walker and Unterhalter, 2007: 5). The capabilities approach to social education is less focused on redistribution and recognition, given inequitable economic and imperialistic cultural contexts, and more focused on individual freedoms to act.

The capabilities approach has been influential, especially in studies of education and development. At the turn of the millennium, the United Nations' Human Development Report (2000: 34) emphasized that, "The rights to food, health, education and privacy—as rights to capability building—were fundamental building blocks of the Universal Declaration of Human Rights."

Building capabilities through education is seen as critical to the exercise of human freedoms, and as Nussbaum (2006) argues, for healthy democratic decision-making, as well. Thus, a sound, socially just education supports students in developing the “habits of mind” that enable critical reflection (Nussbaum, 2006: 387), in a context of respect for all peoples and persons, cultivated through deliberative reasoning and an imaginative ability to empathize with others and express oneself. Socially just education informs democratic participation by supporting the free agency of individuals and respect for the free agency of others.

These three distinctive approaches to theorizing social justice in education variously emphasize the fair distribution of resources, the need for recognition of difference and to counter oppression, and the importance of supporting the development of individual capabilities. There are tensions across these approaches. Notably, the capabilities approach focusses on individual agency and freedom while distributive justice and recognition theories place a greater emphasis on relationships and challenging broad structures of inequity and oppression (Dejaeghere, 2020). Yet all three are rooted in Western philosophical accounts of justice, where these paradigms are diverse, sometimes conflicting but—it is increasingly recognized—far from universal. Next, we explore paradigms of social justice and education where the intellectual genealogies draw their strength and inspiration, in an immediate way, from critical engagement with a range of marginalized actors in Western nations and social movements in the global South. Such approaches may invoke general concepts, like oppression, but they insist on the historical and local specificities, that is, “the concrete situation” (Freire, 2000: 50) of socially just education.

Theorizing socially just education from below

Published in English in 1970, nearly two decades before Iris Marion Young’s (1988) theorization of the “five faces of oppression”, Paulo Freire’s *Pedagogy of the Oppressed* (2000) is one of the most-read texts in the field of education. Innovating from a Marxist intellectual heritage and developed when he was a teacher in Brazil and then in exile, Freire emphasizes that his approach is a response to the lived experiences of peasants and working-class people: “Thought and study alone did not produce *Pedagogy of the Oppressed*; it is rooted in concrete situations and describes the reactions of laborers (peasant or urban) and of middle-class persons whom I have observed directly or indirectly during the course of my educative work” (Freire, 2000: 37). If philosophical theorizing about social justice in education is often, even usually, inspired by injustice and social struggles, Freire makes this explicit as the motive informing a pedagogical project that seeks to be politically and existentially emancipatory for those who are oppressed under current economic and political relationships. In Brazil, Freire sought to counter oppression emerging from stark wealth inequalities, especially unequal access to land, and widespread political oppression and human rights abuses under military dictatorship.

In Freire’s (2000: 52) conception, the pedagogy of the oppressed is a “critical intervention in reality” through which the oppressed cease to be objects and instead become subjects who act in the world, freeing themselves from unjust relationships of domination and fatalistic resignation to the world-as-it-is to become fully human actors creating the world-as-it-may-be. In contrast to what he describes as the “banking” approach to education, in which knowing teachers deposit lessons in the heads of ignorant students, Freire (2000: 90) maintains that socially just pedagogy demands a shared commitment by both teachers and students “to the common task of learning and acting” rooted in genuine dialog carried out with humility and love. Dialogical, critical pedagogical practices encourage students and teachers to develop the freedoms necessary to create new worlds that transcend existing dehumanizing relationships of domination. As Freire explains, socially just education thus depends upon “a serious and profound effort at *conscientização*—by means of which the people, through a true praxis, leave behind the status of *objects* to assume the status of historical *Subjects*” (Freire, 2000: 160, italics in original).

If Freire responded to the concrete historical circumstances of peasants and workers in Brazil, in the 1960s, in Australia, Canada, New Zealand, Sweden and other “first-world” nations, Indigenous peoples were increasingly assertive about the need to challenge education systems participating in the genocide of Indigenous peoples. Since, there has been a long reckoning with the central role of education systems in these nations’ oppression of Indigenous peoples (Andersen et al., 2008; Battiste, 2013; Kuokkanen, 2005; Smith, 1993, 2000). Today, in Canada, for instance, the broader public has had to grapple with the aftermath of the Truth and Reconciliation Commission (2015), which investigated the residential schools that operated from 1867 to 1996. When civil servant Duncan Campbell Scott made attendance at residential school mandatory for Status Indians in 1920, he explained frankly that his objective was “to continue until there is not a single Indian in Canada that has not been absorbed into the body politic and there is no Indian question” (MacDonald, 2019: 71). Indigenous children recognized as “status Indians” under the 1876 *Indian Act* were separated from their families and forbidden from speaking their languages and carrying out traditional practices; many were subject to physical and sexual abuse, in chronically underfunded schools that provided poor housing and, often, inadequate food (MacDonald, 2019; Starblanket, 2018). Indigenous communities have long maintained that the residential schools are sites of mass graves, a fact now more widely accepted as radar technologies have recently confirmed the existence of the graves of hundreds of children, including 250 graves at the Kamloops Indian Residential School in the province of British Columbia and 751 graves at Cowessess First Nation in the province of Saskatchewan (Somos, 2021). In this and other national contexts of contemporary colonialism, Indigenous communities have argued that socially just education must respond to the specific, genocidal harms of settler colonial education systems.

For Indigenous actors, this demands both *decolonization*, challenging colonial education that values Eurocentric knowledges while eliminating Indigenous knowledges, and *indigenization*, the recentering of Indigenous ways of knowing, including Indigenous languages, in formal education from primary school through to university (Battiste, 2013; Gaudry and Lorenz, 2018; Munroe et al.,

2013; Tuck and Yang, 2019). Rooted in commitments to “land, sovereignty and Indigenous perspectives” (Tuck and Yang, 2019: xi), indigenization is about creating “educational spaces for Indigenous peoples, by Indigenous peoples” (Tuck and Yang, 2019: xi). This includes a range of initiatives, among them, language and cultural immersion classes for adult Mohawk learners in Canada (Iehnhotonkwash/Bonnie Jane Maracle, 2002), Sámi cultural learning through extracurricular arts classes in Sweden (Kallio and Lämsman, 2018), land-based pedagogies across diverse Indigenous polities in Canada and the United States (Ballantyne, 2014; Simpson, 2014; Tuck et al., 2014; Wildcat et al., 2014), and decolonizing scholarly inquiry, for instance, through Kaupapa Maori research methods in Aotearoa/New Zealand (Smith, 2008). Institutionally, in universities, indigenization has been pursued by developing Indigenous Studies programs and scholarship, including dedicated associations, like the North American Indigenous Studies Association (NAISA) and peer-reviewed journals, like the *International Journal of Critical Indigenous Studies*, *He Pukenga Korero: A Journal of Maori Studies* and *Wicazo Sa Review* (Andersen, 2020), which seek to critically engage with diverse Indigenous knowledges, on their own terms. For many Indigenous actors, restoring socially just education thus demands the transformation of educational institutions, simultaneously challenging deep-rooted genocidal and assimilationist aims in colonial education systems and creating new spaces within schools and universities for Indigenous people-specific and place-specific ways of being, knowing and doing.

Like Indigenous scholars, *anti-racism* educational experts have challenged existing formal education systems as foundationally unjust, hence requiring strategic interim measures and broader transformation. In particular, they have drawn attention to the ways that supposedly value-neutral pedagogy and scholarship reproduce Eurocentric, patriarchal understandings of the world and rewards middle-class White Anglo-saxon representations of appropriate behaviors in the classroom, from primary school through to graduate education (Dei, 1993; Dua and Lawrence, 2000; Henry et al., 2017; James and Howard, 2021; Troyna, 1987). In Canada, critical race scholars point, for instance, to the underrepresentation of racialized faculty in universities, especially Indigenous and Black professors in the senior ranks and senior administration (Henry et al., 2017; Mohamed and Beagan, 2019), while documenting the ways that many racialized children, especially Indigenous and Black children, are “pushed out” of the education system (Abdi and Ibrahim, 2016; Codjoe, 2001; Henry, 1993). Although Canada is often portrayed as a tolerant, multicultural society in comparison with the United States, *anti-racism* scholars concerned with the reproduction of racisms, observe that inclusion of racialized others is often tokenistic (James, 2001; James and Howard, 2021). Within this context, “visible minorities” and Indigenous peoples are socially constructed as multicultural others, while the educational cultures of the White majority are deemed neutral or universal, even when they narrowly valorize knowledges from those of White European and North American heritage (Rahim, 1990; Jay, 2003; Writer, 2008).

Consequently, *anti-racism* scholars have argued that socially just education requires schooling and universities that specifically redresses race inequities. Afrocentric education, emphasizing the diversity of Black and African knowledges (Asante, 1991; Dei, 1994; Kempf and Sefa Dei, 2020; Hampton, 2010; Thompson and Thompson, 2008), specifically centers “African people’s contributions to Canada, North America and the world” (James, 2010: 205). At the same time, unlike contemporary education which presumes race equity and tolerance, sometimes under the guise of “multiculturalism”, Africentric education in Canada explicitly recognizes historical and ongoing *anti-Black* racisms, so aiming to “challenge and problematize the stereotypes and myths about African peoples held by others” (James, 2010: 205). If such an education supports Black and African migrant students against *anti-Black* racism, in the Canadian context, critical race scholars and *anti-racism* activists emphasize that all youth benefit from schooling that explicitly grapples with race inequities, including as they are reproduced in educational content, pedagogical and learning styles. To those ends, *anti-racism* scholars emphasize that socially just education requires well-financed, institutional strategies to specifically support racialized students, notably including Black youth disproportionately pushed out of education system in nations like Canada (Howard and James, 2019).

Traditions of socially just education system, from *anti-oppressive*, decolonizing and *anti-racism* perspectives, draw their strength directly from broader social struggles. Freire drew on peasant and worker movements in elaborating a pedagogy of the oppressed that he hoped would be existentially liberating for those living in oppressive economic and political circumstances. Indigenous resistance and resurgence movements against colonialism inform challenges to a genocidal, assimilationist education systems, while imagining new/old ways of learning through diverse Indigenous worldviews. *Anti-racism* struggles against normalized and naturalized White supremacy motivate meaningful transformation, over tokenistic inclusion, in education, so as to recognize the diversity of human knowledges and to challenge historical and ongoing racisms. *Anti-oppressive*, decolonizing and *anti-racism* perspective have been developed paying attention to intersectionality in terms of critical disability models of education (Brown et al., 2021; Goodley, 2007; Liasidou, 2014; Parekh and Brown, 2020), LGBTQ+ and queer challenges to inequities in the classroom (Brockenbrough, 2015; MacGillivray, 2000), as well as a range of global South pedagogies—for instance, African educational systems rooted in the concept of *ubuntu* (Ngubane and Makua, 2021; Waghid et al., 2018)—which seek to re-imagine socially just education against the concrete, specific inequities of any given historical moment and place, by working in relationships with and for those from marginalized communities.

Critiques of social justice and education

If there are differences about what socially just education means, in theory and practice it might seem difficult to imagine critiques. After all, who could be against socially just education? Yet critiques of social justice in education have been made from both the right and from the left, or, alternatively stated, from both conservative and reform thinkers.

Inspired by positivist knowledge paradigms, conservative critics emphasize that education is concerned with sharing truth. Truth is established through rigorous argument, and, in the sciences, formally conceptualized in hypotheses that are then tested against empirical evidence. From this perspective, conjugating social justice and education represents a lamentable politicization of universal, value-neutral, rigorous, scientific knowing (Coburn et al., 2013). If conservative critics acknowledge that teachers and students alike may hold political and moral commitments to social justice, they maintain that, ideally, these are bracketed from free, open classroom discussions, in which the unifying principle is neither shared politics nor shared morality but a common commitment to rigorously specified argument. From this perspective, the idea of “social justice teaching” (Sleeter, 2015) threatens to replace meaningful pedagogy with the brainwashing of vulnerable students. Similarly, since rigorous learning is an universal endeavor, Indigenous and African-centered education are vigorously opposed as separatist initiatives that dangerously undermine the common educational basis for social cohesion and the democratic *polis*.

In contrast, reform critics raise quite different concerns about the idea of socially just (formal) education. Among these, the most thorough-going is arguably Ivan Illich’s (1973) critique (1973), since he argues that education systems should be abolished, in the name of social justice. In Illich’s view, education has become a service industry that disempowers the vast majority, especially the poor, who turn to professional institutions to become educated, so coming to distrust their own critical capacities for learning. In this context, in Illich’s estimation, “neither individual learning nor social equality can be enhanced by the ritual of schooling” (1973: 18). More educational institutions, even if they are reformed in important ways, will not result in more skills acquisition and knowledge creation. Instead, what is required is the de-schooling of society and the rejuvenation of pedagogy through informal mutual education among lay people. In this vision, “education for all means education by all” (Illich, 1973: 11), as ordinary people come together to casually develop and share skills and knowledges. For Illich, socially just education demands an end to formal schooling, and associated professionalization and credentialisms, from kindergarten to university. This opens up possibilities for a society that will enable learning as part of a new lifestyle in which we are “spontaneous, independent, yet related to each other” (Illich, 1973: 24), as learning is decoupled from formal, bureaucratic and top-down formal education systems.

Those wishing to defend the importance of socially just education must answer both conservative and reform critiques. Against conservatives, those concerned with socially just education question the underlying epistemological claims that education is about learning universal truths. As Kincheloe (2004: 53) observes, to be realistic, knowledge claims must instead “tak[e] into account the situatedness of the researcher and the researched [and the teacher and the taught]—where they are standing or are placed in the social cultural, historical, philosophical, economic, political, and psychological web of reality.” This parochializes all claims to knowledge, while insisting on a realistic appraisal of how all human beings seek out truth within given historical moments and unequal social relationships. There is no “god’s trick” (Haraway, 1988) that allows human beings access to truth outside of the social and material world in which we all live. Drawing on this insight, defenders of Indigenous and African-centered education observe that supposedly value-neutral classrooms are, in fact, White and often patriarchal, both with respect to curricular content and regarding embodied authority. Rather than replacing universal knowledge with particular knowledges, as conservatives charge, these programs instead counter the inequitable marginalization of Indigenous and African epistemologies and methodologies. In short, for defenders of social justice education, conservatives misconstrue social justice education as an attack on value-neutral education, but this assessment is rooted in the epistemologically erroneous assumption that knowledge can be separated out from social values and political context.

Against Illich, it might be argued that mutual learning in spontaneous groups may lead to strong hierarchies under charismatic leaders, whereas the formality of educational institutions may help curb the personal sway of individual teachers in ways that protect the young and vulnerable. Further, learning through spontaneous affinity groups may encourage people to associate in homophilic networks rather than encountering people from diverse social locations and with a range of political views. This may lead to narrow forms of learning, reproducing in-group thinking rather than producing challenging, critical knowledges among heterogeneous, often unequal publics. In this view, formal, institutionalized and, at its best, universally accessible education may be protective against the dangers of charismatic leaders and the reproduction of narrow, segmented, informal publics rooted in (real or perceived) shared interests. Ultimately, this defense of socially just formal education systems depends upon broad access to high-quality education.

Socially just education may seem difficult to critique, since social justice may appear to be a self-evident good. Nonetheless, there are persistent debates of this kind, especially concerning what conservatives see as the dangerous politicization of education and, less usually, critiques that argue for the abolition of formal education as a means to achieve truly socially just learning.

Socially just education in our times

We have so far presented different visions of socially just education, observing how these are informed by broader philosophical and social concerns with justice, especially the desire to end injustices. We have raised common criticisms against socially just education, from both conservative and reform minded scholars and activists, as well as responses to those criticisms. We conclude here by considering the contemporary moment’s broad range of struggles for social justice in education.

Today, scholarly concern for social justice in education is wide ranging, including, for instance:

- An analysis of barriers to full participation in education by those with non-normative bodies and psyches, in a social justice approach to disability that rejects identification of disability with “deficit, limitation or inability” (Evans et al., 2016: xiii):

- An exploration of queer pedagogy disrupting heteronormativity in education systems by advocating for equity across “all categories of (a)gender performances” (Miller quoted in Pennell, 2020: 2299);
- A call to invest in care for others as a purposeful subversion of neoliberal education, which commodifies teaching and learning as market transactions that are “fixed, priced and traded”, leaving little time and resources for the attentiveness to others that social justice demands (Hölscher, 2018: 44);
- Invitations to the Black Lives Matter movement to remember and participate in “righteous fights for racial justice” (Dixon, 2018: 240) and go beyond demands for inclusion in White educational institutions, instead contributing to radical “imaginations of an emancipated Black future” (Dancy et al., 2018: 190);
- An emphasis on the necessity of re-centering environmental and climate justice, as a social justice issue, in social work education (Beltrán et al., 2016).

As this cursory summary suggests, those concerned with social justice in education recognize that these questions are deeply intertwined with broader question of inequities across society as a whole. These include inequities related to Indigeneity, disability, lesbian, gay and queer emancipation, the neoliberal expansion of marketized relationships, *anti-Black* racism, and demands for ecological justice including that which is related to the existential crisis of climate change.

To those following Rawls, Fraser and Sen, achieving social justice in education in the context of these inequities demands attentiveness to the ways they are structured in and through the maldistribution of resources, failures to recognize the insights and knowledges of minoritized peoples, and inadequate attention to building human capacities. Yet as *anti-oppressive*, *anti-colonial* and *anti-racism* struggles, among others, have insisted, meaningful political action further requires grappling with the historically specific ways these relationships of oppression are maintained through class inequities, political dictatorships, historical and ongoing colonialisms, and White supremacy, as well as ableism, heterosexism, and climate injustice. In short, if education systems are neither separate from broader social injustices nor from the ways these inequities manifest in particular historical moments, then social justice in education is bound up, in profound ways, with the questions: what does the just society looks like and how can we act together, politically, to achieve it?

Introduction

Culture, according to British cultural studies founding father, Raymond Williams (1983), traverses linguistic, social, and intellectual movements in English and European systems of thoughts—signifying multiple, complicated, intertwining, and sometimes problematic meanings and practices of “cultivation”, “civilization”, “art and learning”, “material production”, a whole way of life, dynamics of domination/subordination, and various conceptual developments in academic disciplines such as anthropology (pp. 87–93). In *An aesthetic education in the era of globalization*, South Asian feminist postcolonialist theorist, Gayatri Chakravorty Spivak (2012) refers to culture as “a package of largely unacknowledged assumptions, loosely held by a loosely outlined group of people, mapping negotiations between the sacred and the profane, and the relationship between the sexes ... But these presuppositions also give us the wherewithal to change our world, to innovate and create” (p. 120). Taking culture more specifically as a site for critical, transgressive pedagogical process, bell Hooks (1994) explores African American representations and speaks affirmatively to “the heartbeat of cultural revolution” where cultural criticism can be an educational project for critical consciousness in liberatory ways, “only if we start with a mind-set and a progressive politics that is fundamentally anticolonialist, that negates cultural imperialism in all its manifestations” (p. 7). Smith et al. (2019) (who are from New Zealand/Aotearoa, Canada and the United States/Turtle Island) collectively assert that “Water is life; Land is our first teacher” (p. 1) as a foundational cultural statement agreed upon by far flung Indigenous peoples on the inherently culture-based relationship between Indigenous people and the Land, and as part of the bedrock of the work in Indigenous and decolonizing education. These examples illustrate that culture is both related to pedagogy and itself pedagogical, foundational to making meaning of the everyday and the sacred across time and space.

Culture is not only profound and deeply consequential: Williams (1958/1989) has also declared, rather cryptically, that “culture is ordinary, in every society and every mind” (p. 4). This is a declaration that is deceptively simple. What Williams does through this statement is to challenge the idea of culture as the purview of the elite (e.g., to be cultured is to be middle class or upper class, educated and cosmopolitan; cultural forms are elite forms such as ballet, opera and high cuisine, much of which is expressed in foreign languages). Instead of accepting the taken for granted conception of “culture” as special, rare, and extraordinary, Williams argues that working class culture and popular culture are also forms of culture and should be valued and even studied as such. Culture, he argues, is in fact possessed by all in society, and in every society; it is expressed not only in foreign languages deemed elite but in every local language and accent. Given Williams’ reconception, to know factory floor culture is as valid as knowing boardroom culture; breakdancing, hip hop and spoken word are as worthy of study as ballet and opera and religious incantation; peasant food is as interesting as gourmet cuisine; Kikuyu is as valid a medium for culture in Kenya as English. In other words, culture is everywhere, possessed and expressed by everyone: in short, culture is ordinary. To be educated in the sense of this redefinition of culture is to acknowledge both elite and popular culture, and at times to obfuscate the boundaries between them (think of Pavarotti’s collaborations with Sting for example or the rock group Queen’s “Bohemian Rhapsody”).

As these varied, nuanced conceptualizations illustrate, culture is a complex concept, a veritable floating signifier, definitions of which shift with geographical and especially disciplinary and discursive context. This essay explores the intricate relationship between culture and the field of education, or more specifically the place of the multiple, complex concept of culture and the cultural in the making of forms of critical education. The essay emphasizes the socio-political dynamics of that relationship, in four forms of critical, equity and social justice oriented education, namely critical sociology and anthropology of education, critical multicultural education, cultural studies of education, and Indigenous and decolonizing education.

Culture in sociology and anthropology of education

A substantial part of sociological studies in education addresses questions about and is related to the politics of culture concerning access, reproduction, domination, subordination, and agency (e.g., Apple et al., 2010; Bloomfield and Fisher, 2016; Koh et al., 2020). Cultures, especially school cultures, mediate the process of students’ identity-making, boundary-making and social-

material networks (e.g., McDougall et al., 2004; Carter, 2006; Perrotta et al., 2018), while being part and parcel of local educational discourses, policies, programs, and practices (e.g., Smith, 2012a; Phipps and Young, 2015; Toh, 2020). The concept “cultures of schooling”, for example, examines the ways in which aspects of sociocultural identity such as race, social class, gender, sexuality, ability, migration history, citizenship, etc. contribute to social stratification and operate in constituting school choice, family-school partnership, admission policy, the assemblage of digital technology in learning, as well as students’ experiences of alienation or inclusion in school. For Koh et al. (2020), “critiquing dominant cultures of schooling” is a sustained critical enterprise in sociology of education, especially in the current context of the COVID-19 pandemic and persistent racial injustice affecting societies worldwide (p. 199).

One of the most influential theories on how culture mediates social structure and agency in education is “cultural capital” (Bourdieu and Passeron, 1977). With its micro manifestation as “habitus”, cultural capital is a theory proposed by French sociologist Pierre Bourdieu to understand and critique the process of social domination and reproduction. Most manifest in education (especially in the formal educational system), cultural capital is a form of capital that reflects social class interests and oftentimes the tacit processes through which a hierarchy of cultures (e.g., bodies of knowledge, skillsets, abilities, proficiencies and ways of learning) is systemically reproduced and where people possess, appropriate and utilize these aspects of culture differentially and strategically. Culture—capitalized for material and symbolic privileges and used to mark inter-group distinctions—is thus inextricably linked to social status, power, and domination. It has long been argued that schooling and students’ success are linked to the societal norms that define and evaluate cultural capital—some cultural forms or indeed “cultures” have higher exchange value convertible to a multitude of economic goods and social network resources, while other cultural forms and “cultures” are relegated to lower exchange value or devalued through the educational system (e.g., DiMaggio, 1982). Cultural capital theory has also been applied in the socio-geographical studies of education, beyond the conventional notion of “society” within national borders, especially in dealing with international (middle class and elite) migration, transnational family strategies, international education, and global class mobility (e.g., Waters, 2006; Igarashi and Saito, 2014; Zhang and Xu, 2020).

In extensions of Bourdieu’s primarily social class based conception of cultural capital, some sociological studies in education have revealed that cultural capital relates not only to social class, but also to gender (Dumais, 2002; Sheng, 2012) and race (Lareau and Horvat, 1999; Wallace, 2017; Richards, 2020). Going even further and utilizing a Critical Race Theory (CRT—which originated in critical legal studies in the United States, e.g., Crenshaw et al., 1995) lens to understand inextricable layers of racialized subordination based on intersections of race with gender, class, immigration status, surname, phenotype, accent and sexuality, Yosso (2005) challenged traditional interpretations of Bourdieusian cultural capital theory. In doing so, he introduced an alternative concept “community cultural wealth,” which decenters White middle class cultures and has the potential to transform the schooling process, especially for communities of color. Yosso (2005) presented at least six forms of capital, most of which go unacknowledged or unrecognized, that comprise community cultural wealth, namely aspirational capital, linguistic capital, familial capital, social capital, navigational capital, and resistant capital.

This Critical Race Theory (CRT) informed concept of community cultural wealth not only signifies a departure from the conventional conception of “cultural capital”, but also marks an important development in anthropology of education, especially in re-assessing “culture”—which has long been approached as a whole way of life in anthropology, has problematic colonial entanglements that serve the overall colonizing agenda (Mudimbe, 1988) and the interest of the “colonial administrator” (Hall, 2016, p. 15), and remains a highly contested concept among anthropologists of education (Niesz, 2001; Levinson and Pollock, 2011). To challenge and dismantle the colonial gaze of “othering”, some have pointed out that anthropology of education should contribute (and indeed is contributing) to CRT (Villenas, 2019), and some have envisioned a future of research and praxis guided by CRT and critical language studies (Deyhle and McCarty, 2007). For example, the life work of Lakota scholar Beatrice Medicine has challenged racism in formal and informal systems of learning, and considered Indigenous community-based education, especially the school-based promotion of Indigenous languages, as essential for Indigenous self-determination and cultural survival (Medicine and Jacobs, 2001). As Deyhle and McCarty (2007) argue, learning from the legacy of Beatrice Medicine enables anthropologists of education to view culture in the triangular power dynamics of race, language, and community, and requires a commitment to the understanding that the relationship between culture and education cannot be adequately understood without seriously confronting racism, linguisticism, and the effects of colonization.

With this critical stance, three interrelated approaches in anthropology of education have marked developments in re-assessing “culture”, especially in ways that represent a more asset, resource, and community based approach to culture. One example which has emerged in teacher education in the United States and was proposed by Moll et al. (1990) emphasizes “Funds of Knowledge (FoK)”. Moll et al. (1990) documented how mainstream teachers in the United States failed to acknowledge and build upon the wealth and strength of cultures in working class Latinx (then predominantly named “Hispanic”) communities, in particular their families and household activities as important social and cognitive resources for education. Moll (2005) and Hogg (2011) exhort teachers to seriously engage aspects of students’ FoK across various ethnoracial communities, including family culture, peer culture, community culture, popular culture, place-based knowledge, etc.

Another approach is what has been identified as “Community-Based Educational Spaces (CBES)”, exemplified by Lee et al. (2020)’s ethnographic project with a grassroots, community-based, nonprofit organization in building cross-racial solidarity between low-income Southeast Asian American youth and Black youth. Lee et al. (2020) argue that CBES, which have long been utilized among immigrant communities beyond traditional schools, could play a unique role in teaching youth to engage in anti-racist work by providing opportunities to have conversations on and make sense of the similarities and differences between anti-Blackness and anti-Asian-ness, and to build Black and Asian solidarity with a focus on addressing white supremacy.

A third approach focuses on the concept and practices of “culturally sustaining pedagogy (CSP)”, which was developed in the context of changing demography toward a majority multilingual society of color in the United States and involved advocating for more complex pedagogical approaches to the nuanced, fluid and transnational dynamics between race, ethnicity, language, and cultural ways of being (Paris, 2012; Paris and Alim, 2014). CSP has been utilized in ethnographic studies of racialized immigrant youth in schools (Jaffe-Walter and Lee, 2018) and racialized immigrant workers in adult education programs (Emerick et al., 2020), and has also been adapted as “culturally sustaining/revitalizing pedagogy (CSR/P)” —in the context of ongoing colonization and colonial erasure—employed to understand the linguistic, cultural, and educational realities of Native American communities and Native Hawaiian communities (McCarty and Lee, 2014; Kaomea et al., 2019). For Paris and Alim (2014), CSP is distinct from the past formulation of resource pedagogies in three aspects. First, they emphasize that culture is living and evolving—thus to be culturally sustaining is to support not only heritage but also the dynamic, fluid cultural practices of young people and their communities. Second, CSP recognizes that linguistic and cultural flexibility has an instrumental purpose for both students of color and White students, as multicultural, multilingual skills are increasingly linked to access and power in US and global contexts. Third, CSP promotes a critical analysis of oppressive practices (e.g., misogyny, heteronormativity) within the very cultural formations it seeks to sustain, as well as within the dominant culture.

As these new approaches emphasize a reflexive empowerment of immigrant, racialized and marginalized communities, and as culturally sustaining pedagogy is considered “a powerful next-generation articulation” (Lee, 2017, p. 261) of culturally relevant pedagogy (Ladson-Billings, 1995, 2014) aligned with multiculturalism and multilingualism in educational perspectives and practices (Paris and Alim, 2014), it makes sense to turn to the field of multicultural education, which also involves sociocultural identity and diversity but operates not along disciplinary lines but rather as a philosophy and praxis that addresses representation across the board in educational settings.

Multicultural education

As a philosophy and policy framework, multiculturalism is a popular approach to addressing sociocultural diversity in society and in education, especially in certain Western countries such as Canada (with interculturalism in Quebec), the United States, and Australia. While some philosophers (e.g., Kymlicka, 2012) trace multiculturalism’s origin back to post-World War II, West-led definition of human rights discourse, the movements of multiculturalism in the West were full of national variations, regional metamorphosis, ruptures, and contradictions. In Canada, multiculturalism originated in attempts to bridge the political (and cultural) divide between Anglophone and Francophone Canada, within a bilingual framework, and operated “as a successor regime to race relations which in turn was an improvement on assimilation and explicitly exclusivist and racist immigration policies that reflected Eurocentric conceptions of the nation” (Wright, 2012, p. 104; Taylor, 2012). In Australia, multiculturalism was first presented as the basis for migrant settlement and social-cultural policy in the 1970s, and conceived as a shift from the White Australia policy to a more integration-oriented discourse in recognition of diverse immigrants’ cultural identities (Parliament of Australia, 2010). Multicultural education in this context represents politics of differences that challenge and unsettle the Anglo-Celtic, Europe-centric reproduction of Australian-ness and Australian nation-building (Hodge and O’Carroll, 2006; Ang, 2009). “The multicultural question” in the postcolonial, diasporic formation of British-ness (Hall, 2000) with debates on “multicultural citizenship” related to ethnoracial and religious differences (Modood, 2013) in UK, and the declared “failure” of multiculturalism in Europe resulting in a turn to interculturalism (Chin, 2017), are but some other examples.

Less known is the fact that multiculturalism and multicultural education are not the exclusive purview of the West. Singapore for example, made official and legal commitments to multiculturalism (Keong, 2013), with policies in language and education, and with a particular governance framework of postcolonial “multiracialism” currently structured around the constitutive ethnoracial groups: Chinese-Malay-Indian-Others (CMIO) (Huat, 2003; Goh, 2017). In South Africa, the post-apartheid discourse of “Rainbow Nation” is in operation—from the politics of truth and reconciliation (Aiken, 2016) to the architecture of places and space (Raedt, 2012) to the realities of continued racial inequalities in schools (Teeger, 2015) and to the “sandwiched” position of some minority communities such as the Indian South Africans (Vahed and Desai, 2017).

The formation of multicultural education in the United States exemplifies the complexity, capacity and changes of multicultural education, reflected by the work of many critical educators such as James Banks and Christine Sleeter—two of the most prominent proponents in articulating American multicultural education. Banks (2013) traces the construction and historical development of multicultural education with its embryo emerged from the Civil Rights Movement where debates on culture, schooling, and education were inseparable from African American struggles around racial segregation and citizenship rights. The subsequent development of ethnic studies in the 1970s involved political analysis of multiple racialized and ethnic groups, which called for and became the bedrock of multiethnic education. As multiethnic education through the 1980s expanded to include the intersected analysis of social class, gender, religion, sexuality, exceptionality, etc., broader conceptions of diversity education started to converge into new movements of multicultural education since the late 1980s. A central goal of multicultural education, then, was to transform the school and other educational institutions so that students from diverse groups will have an equal chance to experience educational equality, success, and mobility (Banks, 1992). Other prominent scholars in multicultural education (e.g., Sleeter, 1996, 2009, 2013; May and Sleeter, 2010) have argued that critical multicultural education involves social activism, requires teaching for social justice in classrooms across disciplines, and includes developing teachers’ epistemological sophistication in teacher education. Culture, in this vein, is neither essentialized nor depoliticized. Instead, cultures and identities are framed in

the context of unequal power relations, “as multilayered, fluid, complex, and encompassing multiple social categories, and at the same time as being continually reconstructed through participation in social situations” (May and Sleeter, 2010, p. 10).

One movement in multicultural education is propelled by educational projects based on the cultural difference paradigm, in contrast to cultural deprivation paradigm and rejecting the idea that students of color have cultural deficits. Cultural conflicts and how the educational system responds to such conflicts—rather than intrinsic cultural deficits and individual efforts—explain students’ “(under)achievement”. In this paradigm, educators insist that schools must change in ways that respect, reflect, and responded to the rich cultural strengths of students from diverse ethnoracial groups and use teaching strategies that are consistent with their cultural characteristics, resources, and meanings (Banks, 2013). These changes and strategies—emerged primarily from the contexts of teaching/learning with racialized and marginalized students—are known variously as “equity pedagogy” (Banks and Banks, 1995; Banks, 2013), “culturally relevant pedagogy” (Ladson-Billings, 1995, 2014), and “culturally responsive pedagogy” (Gay, 2000, 2010). For example, culturally relevant pedagogy—emerging from research and interviews with teachers known for their pedagogical excellence in a predominantly African American, low-income elementary school district (Ladson-Billings, 1995)—becomes a model that simultaneously supports students’ academic achievement, affirms students’ cultural identity, competence and integrity, and enables students to critically analyze social inequalities that are relevant to their communities and belongings.

Another related movement in multicultural education is around re-evaluating cultural assumptions, frames of reference, and the value-laden construction of knowledge. Specifically, curricula are reconceptualized in ways that help students understand how knowledge is created, by critically evaluating different kinds of knowledge. These kinds of knowledge—contextualized and scaffolded for students’ learning—include personal/cultural knowledge (e.g., experience from home, families, and community cultures), popular knowledge (e.g., media and pop culture), mainstream academic knowledge (traditional Western-centric in history and the behavioral and social science), transformative academic knowledge (e.g., challenging/substantially revising established canons), and school knowledge (e.g., representations in textbook and lectures by teachers). At a more general level, multicultural education is a process that involves personal, institutional, and systemic changes, through constant inter-subjective construction of knowledge, explication of positionalities and cultural assumptions, creating institutional cultures that value equity and diversity, and critical inter-cultural understanding against discrimination and oppression. Banks (1994), for example, elaborated five dimensions in multicultural education, including content integration, the knowledge construction process, prejudice reduction, an equity pedagogy, and an empowering school culture and social structure. One key goal of multicultural education, according to Banks (1994, p. 5), is to help students “develop the knowledge, skills, and attitudes needed to participate in reflective civic action” in a pluralistic democratic society. In this vein, different approaches to citizenship education, analysis of global and regional migration, as well as international comparative studies in diversity education, have also become the concerns of multicultural education (e.g., Banks, 2009).

This international comparative approach was utilized by Cha et al. (2018) in their exploration of the uneven landscapes of multicultural education in contexts of what they called the “Asia Pacific”, with contributions from scholars doing research projects on diversity and education in Australia, Cambodia, Hong Kong, Indonesia, Japan, Laos, Mainland China, Singapore, South Korea, and Thailand. While the selected societies differ significantly in sizes, political structures, interpretations and issues of diversity, migration patterns, and the (existence/development/lack of) official multiculturalism policies, Cha et al. (2018)’s collection of essays does not prescribe a unified approach to multicultural education but rather signify the contextual geographical sensitivity to diversity and how multicultural education (entangled with different states) operates (or remains absent/unarticulated) in realms such as “conceptualization and perspectives”, “teaching, learning, and curriculum”, “leadership and policy”, and “equity and social justice in the context of diversity” (p. 6).

Examining the status quo and possible future of multicultural education internationally and in conjuncture with policies/practices of multiculturalism, Wright et al. (2012), scholars from Canada, Australia and the UK respectively, discuss how multiculturalism is infused with pedagogical dimensions such as youth identities, global intellectual equality, media pedagogy, multicultural literacy, the critical reading of intersected class elitist, white supremacist, and patriarchal power blocs, as well as potential alternatives to multicultural education. Although caught between “historical and contemporary dissent from the political left and right; continuing post 9/11, post 7/7 bombings backlash on the one hand and the related rise of alternatives like cosmopolitanism and interculturalism on the other” (Wright et al., 2012, p. 11), multicultural education remains an ongoing political project that enables us to learn about student culture, identity, power differentials, diverse epistemologies, and the (globalized but geopolitically divided?) world.

Given the lay of land internationally as articulated by Wright et al. (2012), what kinds of politics on cultural diversity are viable and inspirational at the present global historical moment (characterized by continued neoliberalism and neo-colonialism and a global pandemic)? While multiculturalism and multicultural education in their various forms and along the political spectrum (liberal, celebratory multicultural education remains dominant but there are also conservative, critical and revolutionary forms) might have some answers, we could also turn to the more consistently critical and educationally open discourse of cultural studies and cultural studies of education for more pointed responses to the status quo. As long ago as the 1990s and in the US context, for example, bell Hooks (1994) connected critical educational projects to cultural studies for its transdisciplinary stance and political sensitivity to the everyday extramural sites of learning. In doing so she is influenced by prominent British cultural studies figure, Stuart Hall who declared that “the work that cultural studies has to do is to mobilize everything it can find in terms of intellectual resources in order to understand what keeps making the lives we live, and the societies we live in, profoundly and deeply anti-human” (Hall, 1989, as quoted in bell Hooks, 1994, p. 4). Taking this connection seriously, we examine the relationship between cultural studies and education in the next section.

Cultural studies and education

Considering “cultures” as whole ways of life, as Raymond Williams insisted, and whole ways of communicating, Stuart Hall (1992) locates cultural studies at “the dirty crossroads where popular culture intersects with the high arts; that place where power cuts across knowledge or where cultural processes anticipate social change” (p. 10). In *The Long Revolution*, Raymond Williams (1961/2011) examines cultural changes in the interrelations between democratic movements, industrial developments, and extended communications, including an analysis of the development of “major cultural institutions, from education to the press, ... and the relation between certain forms in art and the general development of the society” (p. 14). These and other questions on an expanded sense of “culture”—(to include popular culture), social class (with emphasis on the working class), knowledge, power, representation (especially of “the other”), communication (as complex process), community (making of rather than given), the postcolonial, the diasporic, race (especially racialized groups and addressing racism), ethnicity, gender (especially women and feminism), hegemony (and counter hegemony), and social change—constituted British Cultural Studies and were manifest in much of the work by the Center for Contemporary Cultural Studies (CCCS). While cultural studies as an intellectual movement has been historicized and contextualized with multiple origins and focuses beyond the British context (e.g., Wright, 1998), its entanglement with, origin in, and relevance to education (including extramural adult education) requires elaboration. As prominent American cultural studies figure, Lawrence Grossberg (1997) once pointed out, education is “one of the most pressing, promising, and paradoxical sites of cultural studies” (p. 374).

Wright and Maton (2004), Canadian and British scholars respectively, come together to offer insightful ways to recognize that history and reconstitute a future of cultural studies in/and education globally and locally (their collection included essays from all over the world from the UK to Brazil, Belgium to South Africa). Education is one of the foundations of cultural studies – for example, all the recognized founding figures of British cultural studies (including Richard Hoggart, Raymond Williams, E. P. Thompson, and Stuart Hall) started their careers and intellectual projects, in extramural adult education with working class learners. From the 1970s onwards, education was an integral aspect of the work of the Center for Contemporary Cultural Studies at the University of Birmingham (which is widely recognized as the original institutional establishment of cultural studies). From the 1980s to the turn of the century in Canada and the United States, there were movements of commingling between cultural studies and education, characterized by the cultural studies’ institutionalization in postsecondary educational programs, and its intellectual relationship with “critical pedagogy”—movements of critical literacy and anti-oppressive education perhaps most ardently articulated by Paulo Freire in the Brazilian context since the 1960s, with impacts on and in dialogue with critical educators and activists around the world (e.g., Horton and Freire, 1990; Hooks, 1994; Slater et al., 2002). Following the development of cultural studies and education, Wright and Maton (2004) point out the relevance of cultural studies to educational policy, institutionalization in higher education, and new directions in critical education: through “the institutionalization of cultural studies in the national academy; the institutionalization of cultural studies in education; and literacy, reading and cultural pedagogy” (p. 82). In another special issue, Hong Kong scholars Chan and Hui (2011) also demonstrated and aimed to further develop the productive interface between cultural studies and education in various contemporary social contexts (including essays from India, Hong Kong, Taiwan, Britain, and Mainland China). With three themes identified as “education as cultural process”, “rethinking cultural practices for education”, and “the work of educators as cultural mediators” (p. 1), Chan and Hui (2011) highlighted how the interdisciplinarity of cultural studies and localized cultural research have influenced the process of policy planning, educational reforms, and pedagogical practices, as cultural studies itself worked as a critical project mediating the relations “between school education, modernization and the emerging hegemony of the modern nation in the global capitalist context” (p. 5).

While it could be argued that the relationship between cultural studies and education in the British context started as far back as the founding fathers of cultural studies work in extramural education and the education origins of institutional cultural studies, in the North American context, that relationship was articulated somewhat later by critical education theorists such as Henry Giroux’s intervention in the field of cultural studies. Giroux (1992) called for cultural workers (e.g., teachers, intellectuals, cultural critics) to cross borders between critical pedagogy (a critical approach to education) and cultural studies—for example through a hybrid discourse of a “pedagogy of representation”. Giroux’s call to imbricate the worlds of critical pedagogy and cultural studies was well received in some quarters in both fields but also resisted in other quarters in the two fields. For example, some in critical education associated cultural studies with “elitism” and a “claim to the moral high ground of a politics of inclusivity” (Steinberg and Kincheloe, 1997, p. 6). While the institutionalization of cultural studies in higher education has happened, forms of curriculum, pedagogy and evaluation associated with (at least) the rhetoric of cultural studies systematically favor students from the new middle class, and students tend to view cultural studies as an entryway to careers into what they consider the more prestigious world of the cultural industries rather than a means of undertaking serious engagement with critical pedagogy and social justice education in the supposedly more mundane world of education. Understandably, questions have been raised about the revolutionary potential of cultural studies—“if radical it must remain marginal, if effective it must become institutionalized” (Maton and Wright, 2002, p. 385). If we are to consider the presence of cultural studies in the academy, the picture is decidedly mixed. In terms of the disciplinarity, cultural studies has influenced several academic disciplines and achieved legitimacy and even considerably high status itself in higher education, having evolved into something of a (post)discipline itself, even as it has retained its characteristic of being interdisciplinary. On the other hand, in its epistemological and political articulations as a global discourse, cultural studies has not achieved sustained transnationalism and inclusion and adequate representation of marginal schools (Tomaselli and Wright, 2008; Wright, 2016; Wright and Xiao, 2020).

Finally, taking cultural studies seriously in education involves (or should involve) a critical departure from European/Euro-American cultural superiority and Western-centric cultural imperialism, and making space for the emergence and prevalence of alternative polycentric ways of knowing and being in the world. For Kenyan writer and cultural critic [Ngugi \(1986\)](#), language carries the culture, and the “mental universe of the colonized” was dominated in part by the use of colonizers’ language and literature which “resulted in the alienation of a child from the child’s history, geography, music and other aspects of culture” (pp. 36–37). Ngugi holds, therefore, that to write in African languages in the African context is to engage in an anti-colonial struggle. In the context of African epistemologies and Blackness, [Wright and Xiao \(2021\)](#) call for “a parallel process of localization, Africanization, Third Worldization of knowledge” in order to decolonize and replace both the Eurocentric body of knowledge and, more importantly, Eurocentric epistemology (pp. 42–43).

Examining modernity and coloniality in the context of Latin America, Walter [Mignolo \(2007, 2009, 2011\)](#) argues that it is important to delink from colonialist hegemonic conceptions of epistemological order, world order, “modernity”, “underdevelopment”, and “otherness”, which collectively position the so-called “underdeveloped world” as having produced only “culture” but not science nor philosophy ([Mignolo, 2007](#), p. 273). He also advocates that the Third World eschew the Cartesian “worldview” for a more holistic “world sensing” not just through the eyes and the mind but by utilizing all the senses and embodied knowledge. For Taiwanese cultural studies scholar, Kuan-Hsing [Chen \(2010\)](#), examining the changing representations of “Asia” in its own contingent historical, cultural, and geopolitical meanings enables deeper understandings of “Asia as method”, a method that invites the intellectual undoing of Cold War logics, continuation of decolonization, and a move toward global deimperialization. While these ideas have been taken up in various educational contexts (e.g., [Carter-Ényì and Carter-Ényì, 2019](#); [De Lissovoy, 2019](#); [Lin, 2012](#); [Lee, 2019](#); [Martín-Díaz, 2017](#)), decolonization is an incomplete process and demands serious understanding of Indigenous approaches to culture. The next section will then focus on the relationship between culture and Indigeneity, involving culturally rooted education, land education, and an ethics of incommensurability.

Culture and indigeneity: culturally rooted education, land education, and an ethics of incommensurability

In *Decolonizing methodologies*, Maori scholar Linda Tuhiwai [Smith \(2012b\)](#) emphasizes the political nature of knowledge production, and the importance for Indigenous communities—while undoing the penetration and surveillance of Western imperialist gaze—to reclaim an ethical theorizing of origins as Indigenous people with various aspects of linguistic and material culture. Culture, in this vein, is necessarily part of the Indigenizing and decolonizing movements in “struggling to make sense of our own [Indigenous] world while also attempting to transform what counts as important in the world of the powerful” (p. 88).

One movement relates to projects about “culturally rooted education” ([Alfred, 2011](#); [Hare et al., 2011](#)) for Indigenous cultural pride, heritage, and revitalization. In the face of ongoing colonialism that erases Indigenous ontological and epistemological presences, Taiaiake [Alfred \(2011\)](#) from Kahnawá:ke in the Mohawk Nation insists that “being Indigenous and being a warrior are one and the same” (p. 7), and culturally rooted education—as a central strategy of anticolonial struggles for Indigenous futures—means to teach Indigenous youth their histories and languages, to see, feel, and think with Indigenous eyes, hearts, and minds. Through Indigenous-led scholarship, pedagogy, and community initiatives, culturally rooted education is manifested in projects such as visual pedagogy for urban Indigenous youth to expose the legacy of the Indian Residential School System, wholistic educational practices provided by non-profit Indigenous youth organization, culturally relevant assessment model for Indigenous students in college, and Indigenous young women circles of leadership for cultural and linguistic revitalization ([Hare et al., 2011](#)). Further in the direction of reclaiming Indigenous cultural and epistemological power in/for education, [Archibald Q’um Q’um Xieem \(2008, 2019\)](#) proposes and elaborates on a foundation of “Indigenous Storywork”, that Indigenous story making, storytelling, and the cultural meanings of stories are valuable knowledge and serious intellectual work, and that decolonizing education involves ethical, pedagogical, and methodological principles working with Indigenous peoples, knowledges, and stories. Originally based on the multi-year research process with Coast Salish/Stó:lō Elders, cultural knowledge holders, and educators from Indigenous communities in British Columbia, Canada, Indigenous Storywork has been taken up by educators across Canada, Australia, and Aotearoa New Zealand, and has been utilized in diverse disciplines (e.g., mathematics education, literary studies, films aesthetics, geography, gender studies, legal practices, etc.).

Land education emerges as a concurrent and sometimes interrelated movement. The interrelated notions that “Water is life; Land is our first teacher” ([Smith et al., 2019](#), p. 1) invite people to think about the deeply cultured relationships between Indigenous people and the Land, as well as the non-anthropocentric, land-based context of learning. Land education not only values ecological interdependence and land as everyday pedagogy, but also recognizes land as alive and relating to Indigenous stewardships, sovereignties and futurities. It is a critical intervention in and departure from conventional environmental education and place-based education that do not seriously address colonialism and in particular settler colonialism and tend to “skip ahead to some neutralized ahistorical, guilt-free, pain-free, romanticized version of environmental education” ([Tuck et al., 2014](#), p. 14). As an Indigenous philosophical construct, Land (capital “L”) is more than physical geographic space or the diaphanousness of inhabited memories—instead, “Land is spiritual, emotional, and relational; Land is experiential, (re)membered, and storied; Land is consciousness—Land is sentient. Land refers to the ways we honor and respect her as a sentient and conscious being” ([Styres, 2019](#), p. 27). With this understanding, land education opens up educational spaces that respect, recognize, and center Indigenous culture (languages, histories, identities, knowledges, cosmologies, and relationships to the places) in ways that affirm Indigenous ontological and epistemological accounts of the land ([Smith et al., 2019](#)). Noting how Indigenous peoples and cultures are constantly

struggling against colonial violence, erasure and reduction, Alex Wilson from the Opaskwayak Cree Nation uses the “cultural iceberg” analogy to call for a deeper understanding of Indigenous cultures in connection to the land: while many people’s knowledge of Indigenous cultures is restricted to visible and material aspects (i.e., the tip of the iceberg being severed from its bottom), decolonization requires restoring the relationships between visible and material culture and “the deep knowledge, value systems, philosophies, cosmologies and other invisible aspects” of Indigenous cultures—the immense bulk of iceberg which cannot be seen, restored, and recognized without “land-based knowledge” (Wilson and Laing, 2019, p. 136).

“Literacies of Land” (Styres, 2019) is an inspiring idea of how Indigenous cultures and land are intimately interrelated, through landscapes, soundscapes, languages, histories, fauna, flora, spirituality, cosmology, wellness, aesthetics, activities, and stories. Connecting language and land-based representation, Rasmussen and Akulukjuk (2009) insist that when discussing environmental education, the crucial question is, “what language does the environment speak?”: in Nunavut, “the land speaks Inuktitut” (p. 285), as language is not simply developed in isolation in human brains, but “in relationship to land and water” (as quoted in Tuck et al., 2014, p. 19). Within diverse Indigenous communities, language is also deeply and foundationally related to specific places, territories, embodiment, and senses of belonging. This explains, for example, why Swampy Cree member and language speaker Kevin Burton felt dislocated and disembodied in making a Vancouver-based documentary (where he translated the place names in Coast Salish territories of the Musqueam/Tsleil-wau-tuth/Squamish to his Cree language), and how he felt more culturally congruent and integral in making a second documentary based in his Cree home territories, using his Cree language. Beyond language, literacies of land enables a holistic, Indigenous-centered reading of and engagement with the land: for example, the non-academic and informal education common among Diné people and their horses (John, 2019), Torres Strait Islanders and their knowledge connected to coral reefs and totemic sea animals (Whitehouse et al., 2014), and Māori people’s nurturing of the harakeke plantation that links together daily life, medicine, wellness, family relationships, plant conservation, and cosmology (Pihama et al., 2019). In Styres (2019)’s words, “Land as a decolonizing praxis informs pedagogy through storied relationships. These stories are etched into the essence of every rock, tree, animal, pathway, and waterway (whether in urban or rural/natural or built environments) in relation to the Indigenous people who have existed on the land since time immemorial” (p. 29).

In Indigenous and decolonizing education, praxes of “culture” involve both epistemological/pedagogical inclusion and political/pedagogical incommensurability. There are notable inclusive, cross-cultural approaches, such as concept of “Cultural Interface” in the Australian curriculum framework (Nakata, 2011), the idea of “Two-Eyed Seeing” shared by Mi’kmaw Elder Albert Marshall in Canada and utilized in science education, environmental education and medical education (e.g., Bartlett et al., 2012), the “Meeting of Knowledges” projects in Brazil and Columbia (de Carvalho et al., 2016), and the different institutional models of “Intercultural University” in Mexico and Ecuador (Cortés, 2017; Martín-Díaz, 2017). In this direction, one of the forefronts is science education at the intersection of Indigenous cultures, community knowledge, and holistic transdisciplinary learning (e.g., Newberry and Trujillo, 2019). While genuine recognition of Indigenous cultures means a rejection of Western-only or Western-centric sciences, it is not a rejection of sciences. To speak with Cajete (1994, 2018), to understand the foundations of Indigenous science, one must participate with the natural world and “must become open to the roles of sensation, perception, imagination, emotion, symbols and spirit, as well as that of concept, logic and rational empiricism” (Cajete, 2018, p. 16).

In a radical vein, “decolonization is not a metaphor” (Tuck and Yang, 2012) is a statement not so much on inclusion/integration, but really on why decolonization must involve sustained praxes (instead of easy adoption of the decolonizing discourse by educational projects) that will lead to the repatriation of Indigenous land and life, as well as center the cultural and political futurities of Indigenous peoples (instead of settlers). Taking decolonization seriously, Tuck and Yang (2012) forward “an ethic of incommensurability” that recognizes what is distinct and what is sovereign for projects of decolonization, which could be incommensurable with some objectives in social justice, critical methodologies, or approaches that decenter settler perspectives. This has important implication for the meanings and methods of education for decolonization. For example, reflecting on critical theory, critical pedagogy, and Indigenous worldviews/pedagogies, Grande (2010) advocates for “Red Pedagogy” that does not retain core Western assumptions, does not center Marxist theory, and does not retain measures of anthropocentrism. Although anti-capitalism and anti-colonialism are not mutually exclusive, Red Pedagogy centers struggles around the broader construct of colonization, in a way that “shifts the pedagogical goal from the critique and transformation of capitalist social relations of production (i.e., democratization), toward the critique and transformation of colonialist relations of exploitation (i.e., sovereignty)” (Grande, 2010, p. 203). Reviewing discourses of decoloniality and in particular the praxes of decolonization in higher education, Wright and Xiao (2021, p. 31) distinguish between “decolonization light” and “true decolonization”: while the former is a softer, reformist approach that includes Indigenous perspectives and cultures in the environmental studies curriculum and assumes epistemological commensurability, the latter is a more radical approach that centers Indigenous epistemological and ontological accounts of land, and assumes ontological incommensurability between settlers and Indigenous peoples in an era of colonialism, especially when it comes to cosmology and the relationship to the land.

Outlining 25 Indigenous projects involving Indigenous and non-Indigenous peoples around the world, Smith (2012a) shows how decolonizing knowledge, research and education might look like for Indigenous communities, such as storytelling to sustain oral cultures and as a culturally appropriate way of representation; repatriating artifacts, remains and other cultural materials stolen or removed and taken overseas; organizing survivance (in the form of story, popular music, cultural events, etc.) that accentuates the degree to which Indigenous peoples and communities have retained cultural and spiritual values and authenticity in resisting colonialism; revitalizing Indigenous languages, arts and cultural practices through school-based, media-based, and community-based education; changing the practices of mainstream science teaching in schools to counter the history of hostile attitudes toward Indigenous cultures and the ways Indigenous students learn; understanding the beauty of Indigenous knowledge; and sharing knowledge

with appropriate cultural protocols/expectations. With these and various other projects, Smith (2012b) cogently reminds us that the imperatives of Indigenous research, learning and knowledge creation should be clear: “the survival of peoples, cultures and languages; the struggle to become self-determining, the need to take back control of our [Indigenous] destinies” (p. 238).

Conclusion

This essay has pointed to the complex relationship between culture and education, especially in the articulation of critical, social justice oriented forms of and approaches to education. In terms of the disciplines, it has focused on how culture intersects with and operates within critical streams in the sociology and anthropology of education. While sociology and anthropology are the disciplines in which that interrelation is most dominant, the relationship between culture, the cultural and education exists in other disciplinary sub-fields of education as well. For example, psychology of education includes concepts such as “cultural development”, “cultural security”, and “cultural barriers” (e.g., Hviid and Mårtens, 2019); in history of education the view of culture as “a society’s way of life and way of thinking” (Giorgetti et al., 2017, p. 2) is important for some progressive historians, and in geography of education there are new perspectives on the cultures of workplace, technology, training, landscape, and the meanings of ‘progress’ (e.g., Mills and Kraftl, 2016). Beyond individual disciplines, culture plays a strong role in the articulation of interdisciplinary and transdisciplinary work in education and the essay has addressed the relationship between culture and education and the formation of cultural studies of education as a primary example. Much of the work addressed is about how education addresses identity and sociocultural diversity in ways that embrace representation and social justice. The essay went beyond the disciplinarity therefore to address culture and the cultural in the form of multiculturalism and multicultural education. Another example taken up was the ways in which Indigeneity specifically is being asserted in education in the forms of Indigenous and decolonial education (including land education and the ethics and politics of incommensurability).

The essay opened not only with the complexity of conceptualizing culture but also with the deceptively basic idea that culture involves a whole way of life and a holistic approach to communicating and learning and this reconception of culture carries through much of the essay in the ways in which the relationship between culture and education is articulated. Paradoxically complex and basic, emphasis has been, throughout, on culture as critical and on critical education, on approaches to both that assume that neither culture nor education are neutral. In this sense the essay has emphasized that culture and education and the relationship between them are not free from but are in fact sites of engagement of power, politics, ethics, meanings, worldviews. Engaging the relationship between culture and education at the current historical juncture involves a background of or better yet active work on and hope for representation of and justice for the historically colonized, oppressed, marginalized, trivialized and exploited. It is in short, education for equity and social justice-at the local, national and global levels.

Glossary

Anti-colonial is the precursor to all decolonizing movements. Anti-colonial evokes political social movements resisting imperialism. Anticolonial movements in former colonized nations worked to overthrow the direct rule of European powers over much of Africa, Asia, and South America.

Colonialism is an (en)forced practice of domination, which involves the subjugation of one people to another.

Colonialization is a state-initiated process by which a political power from one territory exerts control over a different territory. It involves unequal power relations and includes policies and/or practices of acquiring full or partial political control over other people or territory, occupying the territory with settlers, and exploiting it economically and socio-culturally.

Colonial Education is a key mechanism of colonialism that inculcates the children of colonizers in the epistemological institutions housing and circulating systems of power and knowledge of the colonizer.

Colonial violence is the forceful and systemic mental, psychological and physical means of subjugation of one people over another.

Decolonial is a movement to dismantle structures and institutions of oppression garnering the ongoing subjugation colonized peoples.

Decoloniality refers to the departure from the logic, metaphysics, ontology and matrix of power created by the massive processes and aftermath of colonization and settler-colonialism.

Decolonization is long-term process involving the bureaucratic, cultural, linguistic and psychological divesting of colonial power. The term is currently used in the context of Indigenous struggles of self-determination in settler colonial nations.

Epistemicide refers to the systemic silencing, elimination and destruction of ontological, religious, cultural and land-based knowledges of colonized peoples.

Emancipation is the act of freeing oneself or one's people of political, social, legal oppression (i.e., slavery).

Liberation is the act of freeing oneself or one's people of colonial oppression.

Settler colonialism is distinct from the global colonial projects of Empire in that it refers to the specific take-over of Indigenous lands for the purpose of replacing these populations with colonial subjects.

Speculative Future(s) speculate on silenced, erased and subjugated histories to imagine another future world of consentience and cohabitation.

Traumatic colonial history refers to the present-day transgenerational effects of those witnessing the violence, mass degradation, killing, and destruction wrought by previous colonial powers on colonized people.

Introduction

The history of anti-colonial, decolonial, and post-colonial movements arise with liberatory movements in the colonies during and after the fall of European colonialism. Anti-colonial struggles in the former colonized nations reached their height after the Second World War. Colonial occupation and conquest were enacted across continents in the global South and in the Americas. In other words, across the world, wherever European powers invade, occupy, and settle lands that were not originally their own, calls for purging the power and effects of colonization persist. Anticolonialism, like other movements, refers simultaneously to the historical political movement, critical apparatus and schools of thought and action generated from the collective revolt, struggle, and

reclamation of land and way of life of colonized people. In the contemporary moment, struggles continue to eradicate colonial rule and influence in Global South and settler colonial nations.

Anti-colonialism forms the basis for decolonial and postcolonial intellectual movements. Anticolonial critique predates contemporary theories of globalization that present it as a new development of history. Despite its manifestation in local contexts, colonialism has always been a form of globalization requiring the flows of ideas, people and capital to operate. With contemporary globalization, local calls and struggles to decolonize human systems, cultures and relations consolidate into a global movement, particular in a time of pandemic, war and ongoing environmental catastrophe.

As a political project, anti-colonial movements were unevenly successful in ejecting the presence of colonial rulers from their territory. As with decolonial processes, anti-colonial movements are particular to geographic region. These nations continue to mitigate the after-effects of colonial modernization institutionally, legally, educationally and socio-culturally. However, these mitigations are tempered by the necessity or compulsion to compete in the global economy (Soudien and Cornelise, 2000). Moreover, often colluding with colonial power, national elites of the “de-colonized” states continue to uphold colonial institutions of education. Although anti-colonial struggles continue in some parts of the world, for the most part, many scholars and activists has turned to decolonial strategies.

Education is both a mechanism of colonization and liberation for colonized peoples. On the one hand, policies such as residential schooling, assimilation and eradication of native epistemologies continue to hold and have ongoing and deep consequences for selves and societies subject to the educational dehumanization of colonial systems. The supremacy of the white and European cultures continues to be circulated and reinforced through English as the lingua franc and language of capital, ideas, culture, and communication. On the other hand, colonized peoples have recognized the importance of enacting an education that dismantles and puts forth Indigenous and other visions by which to learn, live and be. The recent reclamation of language and educational practices (i.e., powwow) for Indigenous peoples is one such educational horizon that might bring about new forms of humanizing education.

This entry will discuss some of the strategies that proponents of decolonial frameworks advance to combat the violent and powerful cognitive, linguistic and cultural effects of colonial education European colonizers, and particularly, the British Empire. The global “Commonwealth” policy was particularly successful in using education as instrument of knowledge/power to secure the assimilation of first colonial and now world subjects. Decolonial approaches to global British/European metaphysical Empire grounding modern education proves to be the primary site of inquiry, retrieval, speculation, and emancipation for those calling for alternative futures through education in formerly colonized nations (Asher, 2009a,b).

Decolonial and education

The worldwide movements to decolonize nations colonized by European powers were initiated by formerly colonized peoples in Asian and Africa post World War II. These movements were liberatory, seeking to reclaim nation states by, at times, violently taking back political power from the colonial elite and proxies. These liberation movements failed as their leaders did not consider the long-term and lasting effects of soft state apparatus: law, language, education, and culture invading the populations at large. They somewhat naively believed, as Scott (2004) remarks, that a change in power would automatically lead to a change in society. However, a century of colonial rule instituting religious and modern epistemologies in the hearts and minds of colonized subjects would require more than a replacement of heads of states of the modern nation. Or, as Nugugi (2018) insists: “History moves on, theories of liberation march alongside it but without our languages, we will remain trapped in, what literary critic Adam Beach calls the English metaphysical empire” (np).

Education, through language and literacy, is a key mechanism of colonization, particularly for the British Empire. Educational colonization enacts an insidious and onto-epistemological form of rule over the mind and bodies of its subjects. The effects of colonial education are long lasting as they garner assimilation of native populations into the ways of life of the colonizer such that the colonial subject no longer recognizes what Franz Fanon (1961/2004) conceives as “his true nature” (p. 198).

As John Willinsky (1999) documents in *Education After Empire*, winning over the hearts and minds of colonial subjects through cognitive, affective, linguistic, religious and cultural force was a formative pedagogical instrument of the British Empire. Education formed a significant aspect of colonial policy in India, as documented in Maccauley’s minutes of 1816 where the policymaker espoused the “intrinsic superiority of Western literature” over that of ancient Sanskrit and sacred texts foundational to a centuries long civilization in the South Asian subcontinent.

Maccauley’s (1835) imposition of the “English language and literature” into the education of Indians was designed intentionally to assimilate the minds and habits of Indians. “We must,” he writes,

at present do our best to form a class who may be interpreters between us and the millions whom we govern, –a class of persons Indian in blood and colour, but English in tastes, in opinions, in morals and in intellect. To that class we may leave it to refine the vernacular dialects of the country, to enrich those dialects with terms of science borrowed from the Western nomenclature, and to render them by degrees fit vehicles for conveying knowledge to the great mass of the population.

A version of this class of interpreters, what are now teachers and educators, converting native populations into “Englishmen” was replicated with peoples in every Commonwealth outpost in the world, including Indigenous peoples of the Settler Americas. Supplementing the conversion of colonized peoples, was the enslavement and indenturement of the poor and dispossessed for capital gain. With the rise of the American Empire and its media, cultural and commercial technologies of education, English and racist capitalism was exported across the world such that Anglo/American culture has instituted itself as superior to all others as McCauley terribly designed. The effect of this formation of an elite class of English subjects who gain privilege from an English education and its privileging of white cultures (Adichie, 2009) set the course for the triumph of the superiority of the West, whiteness, and English-Medium systems of education across the world.

At its core, decolonial education addresses the dismantling of colonial metaphysical and cultural systems imposed on and internalized by a peoples through instruments of power. It does this in two ways: first, decolonial education seeks to counter the dehumanizing logics of subjectification used to dismiss and silence the knowledge and way of life of colonized people. Second, decolonial education seeks to recover these subjugated and erased knowledges and ways of life as educative in of itself. Decolonial education is an intentional project that aims to emancipate colonial subjects by liberating schooling institutions used as apparatuses of colonial power. In every formerly colonized nation, there are ongoing efforts to decolonize schools, universities and other public educational sites. Decolonial interventions cross a range of institutional, curricular and socio-emotional registers of modern public and higher education.

Decolonial struggles manifest differently in localized nation-state contexts subject to myriad and shifting forms of imperialist, settler and empire colonialism. For countries colonized by the British Empire, decolonizing is especially a double-bind: the linguistic and cultural tools and English education affords its subjects are now highly coveted capacities and knowledges across the world and, yet, one’s assent to an English education seals one’s implicatedness in ongoing structures of oppression. Influential children, who often have no say in the matter of their schooling, are implicated in colonial, and now capitalist and commodifying systems through compulsory public English medium schooling (Coetzee, 2021).

Decolonial education is put forth by many scholars as a means of mitigating the colonial-capitalist foundations underpinning modern education. Approaches by educational scholars and researchers are largely curricular, aimed at countering canonical and representational knowledge as a means to decolonize education. For example, in *Decolonizing Education*, Marie Battiste (2019) calls for the revitalization of Indigenous principles and worldviews of knowledge in educational classrooms.

In her book *Red Pedagogy*, Sandy Grande (2015) looks to Indigenous and decolonizing methods to counter and purge colonial imposition on Indigenous knowledge and way of life. In the historical context of Anti-Black racism, George Dei (2006) has called for a retheorization of “blackness” through indigeneity to interrupt categorical understandings of curriculum grounded in racialization. Nina Asher (2009a,b) looks to rethinking one’s selfhood and homeland as a means to delink self from one’s Western education. And Bettina Love (2019) calls for abolition as an epistemological framework that can bring about educational freedom for Black people and their descendants in the Americas colonized through enslavement.

Recently, the term decolonial is reclaimed by Indigenous scholars as politics rather than as epistemological intervention. Seeing that movements in mainstream educational institutions have failed, Tuck and Yang (2012) sought to reinvigorate the term by calling for what anti-colonial scholars did a century before: demanding the repatriation of land to Indigenous peoples. Tuck and Yang argue that “decolonization is not a metaphor” claiming: “When metaphor invades decolonization, it kills the very possibility of decolonization; it recenters whiteness, it resettles theory, it extends innocence to the settler, it entertains a settler future” (p. 3). Tuck and Yang rally those who use the term loosely to reserve and reclaim it for Indigenous struggles to reclaim land appropriated by settlers.

In “Slavery is a Metaphor,” Garba and Sorentino (2020) argue that Tuck and Yang’s (2012) bid to reclaim and resituate decolonizing in the native-settler colonial nexus occludes the existence of the historical, material and political ongoing realities of the descendants of enslavement and racialized people subject to anti-Black racism. Garba and Sorentino (2020) position highly politicized identity-based arguments as dangerously a-historical and ironically a-political.

By centralizing political ontology precisely as the problem of the relationship between history and contingency, materiality and the symbolic, we attempt to account for the genesis and structure of modernity, and propose slavery as the code that functions as “the a priori or ground of the history to which it gives rise.

(p. 11).

Contra to Tuck and Wang, Garba and Sorentino suggest the uncertainty of metaphor carried by decolonial movements opens to a way forward for an education that liberates. They lean on Mignolo’s (2007) argument of delinking colonial epistemology from epistemology proper as educational in of itself. Eschewing decolonizing as an enactment of the reclamation of land and undoing of settler innocence, Garba and Sorentino call for engaging the failures of decolonizing movements to expunge from epistemologies the logics of Anti-Black and other racisms. They suggest a rethinking of the metaphoric and material conditions of enslavement in relation to the ongoing effects of colonialism founded in the violent capture of racialized peoples elided with colonial notions of property as land.

Toward decoloniality

As Garba and Sorentino (2020) predict, decolonializing has become hyper-metaphoric in educational and mainstream North American culture. Without dismantling or abolishing the metaphysical and Anti-Black moorings of neoliberal capitalisms, decolonializing movements like the anticolonial ones before them, are stuck in a war over positions and representation (Gilroy, 2014; Mishra Tarc, 2015). Decolonizing movements continue to fail to address the ongoing racist and material effects of colonization and harness the imaginative power of rethinking an education that frees rather than subjugates. Rather than advancing a radical education, the term decolonizing is disturbingly taken up in many neoliberal and managerial campaigns as a rhetorical substitute for social change and justice. Equity, Diversity, Inclusion and Decolonizing (EDID) mandates, warriors, and slogans abound in educational and corporate institutions. Ironically making decolonizing a literal politics of land reclamation that is cut off from education, has made what was once an epistemological and educational emancipatory project, easily accommodated and mobilized by capitalist politicians, institutional leaders and neoliberal PR firms.

As calls for EDID as decolonization mount in pluralistic nations, the histories of struggle underpinning specific decolonial movements are emptied of meaning. To recover the decolonial is to return to an understanding of the purpose of education itself which is onto-epistemologically colonial in Western contexts. The educational end to make children particularly human has a long history of signification that requires rethinking education in terms of what Franz Fanon positioned as rereading the human toward the pedagogical praxes of generating new socialities. A hermeneutics of the human requires a reading and rereading of the self under formation as caught in colonial and racist histories. Pedagogy refers to a sociogenic analysis and intervention into colonial subjectification as an ongoing praxis of undoing colonial structures. For Fanon, to decolonize was to begin the process of creating a new species of men (sic) and forms of life in the quest for being human in the ways each are all uniquely meant to be. This struggle for humanizing and the humanity of us is political, onto-epistemological, social and pedagogical, in other words, educational.

Following Fanon, Achille Mbembe (2020) suggests we might view decolonization not as politics or project, but “as an act of refusal turned into an act of self-assertation, an act of rebellion turned into an act of refoundation,” one “imagined as a kind of relation to the future” (p. 11). The future here is not teleological or projected on to unborn children as per our modern understandings. Rather this horizon of the possible aligns to the category of the future as advanced by Indigenous and Black scholars. The future as human potentialities are “another name for the force of self-creation and invention” (p. 17) in search of new modes of beyond human existence. As Mishra Tarc (2015) argues in *Literacy of the Other*, this relational pedagogical force of self and societal determination, in the first place, grounds the impulse for resistance and revolt of the colonizing impositions of the other. It is this specter of another future that sustains movements to decolonize the mind and societies from the violences of Eurocentric modernity, racism and other colonial systems.

The decolonial in education has yet to find full form in the way first envisioned by Fanon (1961/2004): a collective fight as a species to reclaim and remake our humanity from the forces of domination and oppression that continue to subjugate and confine one’s mind and our human potential to the violence of, supremacist and racist metaphysics of being. In many ways, Fanon’s (1961/2004) plea to colonized subjects to understand “The European game has finally ended” and to “find something different” toward the intentional and profoundly pedagogical struggle to “set a new history of the human” (p. 311) has yet to be initiated. Scholars of education and the academy prefer to wage territorial and turf knowledge wars rather than turn their critical view to the world wracked with disasters produced by the delusional supremacist logics of Empire itself (this “preference” of course is itself structured by the pedigree and class positioning of university scholars). In the moment of the pandemic, world wars and climate catastrophe perhaps we are more directly witnessing the undeniable consequences of maintaining Eurocentric modernity to the point that our humanity may not recover and find its way back to what Fanon (1961/2004) calls its Originary native being and citizenship.

Mobilizing the decolonial

Acknowledging historical failures, wrong turns, and that “decolonization is a messy, uneven process”, Andreotti et al. (2015) look to decoloniality and its tools as pedagogical interventions to the established “vocabularies” and vernaculars of modernity (p. 22). Following Black and Indigenous critical educational scholars engaged in the futures of the decolonial, Andreotti et al. call for speculative approaches grounded in specified histories of colonial oppressions. They find the constructing of social cartographies that can present numerous ways of attending to “the violences of modernity” that might, in turn, lead to a “mapping of different visions of decolonizing in higher education” (p. 22). Andreotti et al. emphasize that the pedagogical provides the possibilities of non-normative or interruptive knowledges, ideas, encounters and experiences unlike projects of education that follow the colonial and instrumental impulse to assimilate, habituate or form subjects into particular ways of thinking and being.

Ngugi’s (1981) call to “decolonize the mind” is a precursor to the decoloniality movements advanced by Walter Dignolo and others in the South. Decoloniality is primarily an educational means by which to undo colonial structures deeply embedded in the social-political, institutional, and cultural organization of formerly colonial people. According to Dignolo (2017):

Decoloniality means first to delink (to detach) from that overall structure of knowledge in order to engage in an epistemic reconstitution. Reconstitution of what? Of ways of thinking, languages, ways of life and being in the world that the rhetoric of modernity disavowed and the logic of coloniality implement (np).

For Mignolo, decoloniality does not reject modern knowledge as these disciplines provide critical means by which examine colonialization, settler colonialism and its intersections with white cultural superiority and racial capitalism. Mignolo (2011) instead calls for sustained and critical engagement of the procedures, discourses, culture and other colonial mechanism continuing to steer hierarchies of economic being across the globe today. As he indicates:

although knowledge-making is a common human endeavour ... the racialization of places and people in the formation and transformation of the colonial matrix of power not only established hierarchical ranking between languages and categories of thought, but also built economic and political structures of domination and oppression based on the geopolitical and hierarchical organization of knowledge (p. 141).

To truly embark on decolonizing colonial structures from modern institutions of knowledge and education, Mignolo recommends that we de-link from universalizing Eurocentric epistemologies, to engage other knowledge, perspectives and cosmologies as a “pluriverse” (see also Grosfoguel, 2007).

Decolonial scholars and researchers examine the modes of epistemicide colonial knowledges enact on their subjects through the erasure of linguistic and cultural knowledge systems to lift up those systems as key to the revitalization of a de-linked knowledge (Mignolo, 2007; Grosfoguel, 2007). Or as Mignolo (2011) insists: “The decolonial option does not simply protest the contents of imperial coloniality; it demands a delinking of oneself from the knowledge systems we take for granted (and can profit from) and practicing epistemic disobedience” (p. 122). Along with encouraging disobedience, myriad approaches to the decolonial reject monolingualism and culturalisms and the epistemological and national methodologism(s) tied to territorial modernity and or specified supremacist logics of English and/or European metaphysics. Rather, the decolonial disrupts and destabilizes that link to insert colonized and erased ways of life for modern potential and possibilities of reviving old-new worlds eradicated by Empire.

As with Mignolo, Sylvia Wynter (in Snaza and Mishra Tarc, 2019) turns to education and study to call for decoloniality as the key mechanism by which the colonial structures of knowledge/power can be exposed, unraveled and weakened. She argues that racialization founding European colonization remains its most pernicious effect, one that requires a systemic dismantling from the concepts, institutions, and practices upholding mythologies and ideas of the white man as the human par excellence. Wynter insists that categorical norms and names for the human along registers of phenotype, sex, and ability as contributing dehumanize those who identify and are visibly identified by hierarchical markers of social difference. Wynter (2003) calls for a direct and studious confrontation with the histories of colonialism and their vicious after-effects through sustained critique of the ever morphing racist-capital systems of knowledge-power keeping white, male supremacy intact.

Challenges abound for Indigenous and Black scholars of education engaging a reclamation of eradicated knowledge through decolonial frameworks. Unlike formerly colonized subjects residing in nations with long oral, symbolic, and documented traditions of languages and educational systems, these systems were near-terminated and finitely eradicated for Indigenous and Black peoples in Settler colonies. These peoples are put upon to excavate reclaim, revive language and cultures expunged from their cultural memories through cultural and linguistic epistemicide (Santos, 2014).

Another challenge that continues to negatively impact Indigenous and other formerly colonized communities, Dwayne Donald (2021) argues, the legitimizing of objective, documentary, and scientific methods to determine the worth of knowledge. For Indigenous communities where words do not identify and mark but rather embody philosophical ideas and knowledge, Western knowledge continues to institute diminishment and erasure of relational thought-being systems Indigenous people rely on to understand and live in the world. This thought violence to entire communities of Indigenous people goes unrecognized in modern systems privileging instrumentalization and valuation of knowledge. The eradication of the onto-epistemological or relational knowledge has brought about an ethnic cleansing of Indigenous and other worldviews and knowledge systems (Santos, 2014), and also the very means by which Indigenous encounter others, beyond human others, and the world.

An ongoing challenge faced by Indigenous and Black schools is an over-dependence on the archives, methods, and products of Western modernity to excavate and reconstruct their eradicated experiences and knowledges. In his work on Black speculation and futurity, cultural critic Mark Fisher (2014) opts for epistemologies not tied to identities and institutions, or nations and histories, and turns to the ephemera of speculation and hauntology as frameworks for critical and scholarly enquiry. For Fisher the only way to decolonize the future is to look for its appearance in histories of the past. Embracing a similar politics of the future, Ferreira Da Silva (2014) turns to art and aesthetics to speculate the possibility of conceiving knowledge as “poethics”, a mode of epistemology that resists and exposes the Western epistemological default of positioning the racialized subject as other rather than tethered to the colonial one.

Alongside these “future-looking” and “disobedient” gestures to decolonize are student grassroots movements. In March 2015 students at University of Cape Town sparked the #RhodesMustFall movement after they organized to take down a statue of apartheid proponent, white supremacist and imperialist Cecil Rhodes. Soon after in June 2017 educational authorities agreed to a student request to take another statue of Rhodes down at Orion Campus at Oxford University in the UK (Lewis, 2019). On May 2011, students at Ryerson University in Toronto penned a letter to university officials stating they would refer to the university as X after refusing to belong to an institution named after the colonialist proponent of Indigenous residential schooling (Toronto Star, 2021). Through these revolts against the symbols of a colonialism not yet past, decolonializing becomes part of a larger futurist movement of public pedagogy, a living collective form of education through grassroots calls for redress.

A myriad of scholars and students engage new frameworks of the future to chart decolonial pathways that do not replicate Western systems and traditions of knowledge that they argue continue to do harm to the earth and its inhabitants. In a collaborative piece Andreotti et al. (2016) call for a new charting of cartography through sociality rather than territoriality as way forward. Stein et al. (2020) similarly embark on a study of decolonial futures through a myriad of speculative and post-human frameworks, as means of generating thinking that exceeds the man-centric systems of knowledge grounding Western colonial knowledge systems. The numerous un-named student groups calling to decolonize the universities are also leading the way in scholarly communities. These new intentional and ground-up collectivities call for a future rid of colonial logics past to advance the decolonializing impulse as the key movement of thought and of thinking the possibilities of “another world” for a scorched and reeling earth and all its inhabitants (Roy, 2003).

Conclusion

The decolonial in education is at a crossroads between reckoning with the effects of the traumatic colonial past and charting new forms of “beyond human” educational modes, forms, forums, and imaginaries. As the political, social and existential effects of colonial powers come to roost in this volatile and precarious historical moment, we are seeing increased need and calls for collective thinking and action between educational scholars, students and activists. These collectives coalesce around the need for an education to dismantle the habits of mind, the violent logics of property and the commodity and racial identification conceived and enacted by European empire.

Clearly, in education there is a need to move the decolonial beyond localized politics and projects to a larger, relational world-view such as those advanced by Fanon, Mignolo and Sylvia Wynters. Many educational scholars such as Snaza and Mishra Tarc (2019), Love (2019), and Andreotti et al. (2016) recognize the need to ground the decolonial in its historical antecedents and deploy it through speculative approaches oriented by new onto-epistemologies that can withstand the violence of the past fueling and coupled with uncertainties of the present day. Forging new educational institutions, arrangements and collectives the decolonial can guide our thinking, knowing and learning between the past and dead futures to engage a metaphysics of being untethered to race, patriarchal heteronormativity, capital and territory.

Introduction¹

Citizenship is commonly understood as a legal category. For example, the name of the state that defines one's passport is often seen as an important signifier of identity.

Legal citizenship status is certainly significant, as this is often pivotal in determining certain rights and protections in relation to states. Legal citizenship status can be one signifier for national identity, including feelings of patriotism that have proven to be central to many political acts such as wars, occupations, settler colonialism and border controls (Anderson, 2006; Wolfe, 2016). However, a focus on national identity regarding citizenship risks blurring the complexity of differences and the intersections within, across and between identities (Crenshaw, 1991; Carastathis, 2016).

Legal status is actually only part of how we think about the many facets of citizenship, including borders, belonging, relationships, and interactions with other identities or peoples who are non-citizens. Citizenship, and its relationship to identity and difference, suggests a series of processes more complex and varied than a passport, or other symbols like flags or currencies. This complexity is indicated when we consider certain questions, such as why everyone, or every nationality, does not have a recognized passport, and many lack legal status in a given country. Other related questions include: who is deemed a citizen of a state and who is not? How are citizens of the same state treated differently, and why? Why are some citizenship statuses considered important, while others are treated as diminished or even threatening? And how and why are some populations denied rights of citizenship through violence and dispossession?

Importantly, citizenship for some always occurs against a background of non-citizenship for others. Citizenship elevates borders and related power relations when the line between citizenship and non-citizenship is defined (Stasiulis and Bakan, 2005). Citizenship, therefore, is actually better understood as a spectrum of negotiated and contested rights and obligations among people and states. This spectrum includes features of both state repression and protections, which are changing and unstable. The spectrum of citizenship and non-citizenship, varies greatly over time, place and populations. This reveals tensions between the universalistic discourses and discriminatory impact of policies and practices of modern democratic states (Stasiulis and Bakan, 2005). Legal citizenship in states in the global north – such as Canada, the United States, or the states of Western Europe – for example, are considered to represent political memberships that are elevated in a global hierarchy, whereas citizenship in countries of the global south are different, often altered by patterns of colonialism and imperialism. Moreover, within states of the global north, large sections of the populations – including for example Black, Indigenous and racialized populations, sexual and gender minorities, and those living with disabilities – also have differential access to rights of citizenship.

The spectrum of citizenship and non-citizenship generates various types of differences, and multiple identities. In what follows, drawing on the example of Canada as a case study, the discussion addresses contradictions and tensions regarding the citizenship/non-citizenship spectrum from the perspective of differences and identities. Canada is a notable example because it is widely seen as a state modeled on successful, inclusive citizenship. In fact, such a rhetorical promise of universality stands in contradiction to reality, and the gap between the promise and experience of multiple exclusions reveals the ongoing character of Canada as a colonial settler state.

While Canada, like all states, indicates unique features and a specific history of economic, political and social experiences, as a liberal democratic state which belies the promise of inclusive citizenship it can serve as an important entry point to wider comparisons. The focus of this chapter is specifically on the exclusionary impact of racism in Canada, grounded in a political economy of exploitation and colonialism (Bakan and Dua, 2014; Dei et al., 2000; Dei and Kempf, 2013; Galabuzi, 2006; Bannerji, 2014; Thobani, 2007; Razack et al., 2010). The Indigenous and Black populations of Canada are particularly impacted (Monture-Angus, 1995;

¹Some parts of this chapter are based in Abigail B. Bakan (2016) "Multiculturalism and its Contradictions: Education for Citizenship and Social Justice in Canada", in *The Palgrave International Handbook of Education for Citizenship and Social Justice*, eds. Andrew Peterson, Robert Hattam, Michalinos Zembylas and James Arthur (UK: Palgrave), 347–368.

Canada RCAP, 1996; TRC, 2015; McKittrick, 2006; McKittrick and Woods, 2007; Walker, 2010), as well as, most notably in the years since September 11, 2001 (9/11), those ascribed to be associated with the Muslim faith or of Arab origin (Abu-Laban and Dha-moon, 2009).

This discussion proceeds by first considering the Canadian state as an example of “multiculturalism”. The rhetoric of multiculturalism will then be considered against the realities of difference and oppression, with a focus on racism and dispossession. Then, turning to the contemporary period, with a focus on immigration and the period from 9/11 through the pandemic of the 21st century, the ways in which certain crises reveal and exacerbate these contradictions will be addressed. The chapter will conclude with a consideration of the implications for education for citizenship.

The Canadian State and multiculturalism

The context in which contested notions of citizenship, identity and power emerge is significant. Canada is a federated state, where the federal, central government shares power according to specific terms with elected provincial parliaments or assemblies. The central parliamentary government in the nation’s capital city, Ottawa, resides in the province of Ontario, and manages the overarching affairs of citizenship according to designated powers. Subject to this central authority, other governing powers specific to certain regions rest with Canada’s provinces and territories (Franks, 1987; Tully, 1995). Provinces have specific regulatory authorities regarding education, employment, health care, language and residence.

Multiculturalism was adopted as the official policy of the Canadian federal government in 1971. This was preceded by the report of the Royal Commission on Bilingualism and Biculturalism from the 1960s (Haque, 2012); the policy adoption was followed by the passage into law of the Canadian Multiculturalism Act in 1988. The Multiculturalism Act also followed the repatriation of the Canadian Constitution in 1982, which included a Charter of Rights and Freedoms (Canada, 1982). Significantly, the Multiculturalism Act notes in the preamble that the Canadian state recognizes diversity among its citizens – specifically regarding race, ethnic or national origin, religion and color – and indicates a commitment to preserving and enhancing this multicultural heritage. The Multiculturalism Act also commits the state to working to achieve “equality of all Canadians”, in every aspect of citizenship, including the economic, social, political and cultural dimensions (Canada, 1988, preamble, 2).

The language presented by the Canadian state, both domestically and on the world stage, is bold in its claimed assurance of inclusiveness and equity, noting that multiculturalism is “fundamental” and “encourages racial and ethnic harmony and cross-cultural understanding, and discourages ghettoization, hatred, discrimination and violence” (Canada, 2022). The Act has also been the subject of intense critique, noting the gap between the bold rhetoric and the experiences of ongoing and intense discrimination within Canada.

A number of examples indicate the gap between promises and reality. Millions of Canada’s citizens have left their homes of origin and all that is familiar to them to seek permanent residence in Canada. Canada has one of the highest rates of immigration in the world, measured in terms of both overall and net migration (IOM, 2022). Moreover, Canada also has one of the highest rates of naturalization of any country, with a large majority of those who immigrate successfully obtaining legal status of Canadian citizenship (Picot and Hou, 2011a, p. 171). In terms of formal educational success, second-generation immigrants to Canada measure highly compared with international indicators (Picot and Hou, 2011b).

These numbers, however, belie experiences of systemic, structural discrimination evidenced in the formal education system. This contradictory pattern, where the promise of inclusion for diverse communities is halted by powerful barriers to equity in education, is characteristic from primary through to university levels, with lifelong implications (Cunningham, 2007, p. 153; Razack, 1998; Maynard, 2017). The official context of formal inclusion associated with multiculturalism serves to mask continuing and deepening exclusionary barriers to equal citizenship for marginalized sectors of Canadian society. Historic contextual factors include formal colonialism, racial slavery and the genocidal residential schooling of Indigenous children. The contemporary context continues to enforce patterns of racism and colonialism, even in an age of redress and a political climate of recognition (Coulthard, 2014). The patterns of discrimination in Canadian citizenship practices remain deeply entrenched, based on class, ability, gender, language and ethnicity, among other factors (Razack, 1998, 2015; Stasiulis and Bakan, 2005; Titchkosky, 2003; Little, 1998; Malhotra and Rowe, 2014).

The contemporary period can be traced to Canada’s policies during World War II, through to the period of the “war on terror” following 9/11 and related policies, and the contemporary period of COVID-19 pandemic.

Rhetoric versus reality: racism and dispossession

The specific historical context of Canada’s claim to multiculturalism is significant. Canada was established as a white settler state, officially founded in 1867, where British subjects were privileged to be eligible for the legal status of citizens (Abele and Stasiulis, 1989; Stasiulis and Jhappan, 1995; Thobani, 2007).

Imperialism is a system of state power based on empire, where the rulers of one state own and control the land, resources, rights to population and products of labor of another state, whether through formal policy and politics or military force, or both. As Edward Said notes, “[m]odern imperialism was so global and all-encompassing that virtually nothing escaped it ... [and] the nineteenth century context over empire is still continuing today” (Said, 1993, p. 68). Colonialism, the policy of imperialism based on dispossession and colonization, takes various forms. It continues today even where formal governmental autonomy has been achieved in former colonies (Coulthard, 2014).

Multicultural policy followed from debates about the nation's linkages to European empire and colonialism. The Royal Commission on Bilingualism and Biculturalism was commissioned in 1963, under the Liberal government of Prime Minister Lester B. Pearson, in response to a rise of French-Canadian nationalist sentiment in the province of Quebec (Gagnon, 2004). Among the Commission's key recommendations was that Canada adopt both French and English as official languages; this recommendation was accepted and made into law under the administration of federal Liberal Prime Minister Pierre Elliot Trudeau (father of Canadian Liberal Prime Minister Justin Trudeau) in 1971. Second in size only to Ontario, and constituting about one-third of the Canadian population, Quebec is the only one of ten provinces where French is the first language for 80% of the population. While recognizing the significance of Canada's historically excluded and oppressed Francophone population, the Commission's report came under heavy criticism for its Eurocentric focus on those of English and French descent as foundational to the Canadian nation. Multiculturalism emerged as a counter-point to "biculturalism", largely because "non-British, non-French, and non-Aboriginal Canadians – especially those of Ukrainian origin – challenged the symbolism of a bicultural and bilingual Canada" (Abu-Laban, 2007, p. 140). As multiculturalism advanced as a dominant governmental initiative, and as a public narrative of Canadian nation-building, its limitations – absencing Indigenous rights and languages, absencing Canada's Black population and privileging European colonial settlement – have become the subject of substantive critique, in scholarship, policy and social movement activism (Stasiulis, 1988; Tully, 1995; Day, 2000; Mackey, 2002; Galabuzi, 2006; Abu-Laban, 2007; Thobani, 2007; Kernerman, 2005; Dhamoon, 2009; Haque, 2012; Coulthard, 2014).

The Canadian state's close association with British imperial policy is well-documented and widely recognized, originating from a federation of colonial territories in North America. Indeed, Canada is, to this day, a constitutional monarchy. The connections to the British Crown are symbolically central to national cultural signifiers including anthems, currency, cultural practices and holidays, citizenship law and the structure of parliamentary governance. This fact of Canada's foundational history is not subject to contention. However, the details of the colonial experience and the implications of this association and its continued impact on contemporary issues of social justice and citizenship are key issues of ongoing debates, influencing social, economic, cultural and political spheres.

The process of settlement included centuries of conflict among European empires. This included competition over North America with France, whose prisoners were among those exiled to colonial North America where the Catholic Church was a primary actor (see Gagnon, 2004). The Indigenous peoples of the land of Turtle Island (North America, before contact) encountered these European strangers variously over the period from first encounters, with some sections of French settlers interacting with Indigenous peoples, emerging into the population of Canada's Métis (Lawrence, 2004; Lischke and McNab, 2007). However, current historical studies demonstrate that violent European colonial dispossession, theft and occupation of Indigenous land, suppression of language and culture, violence toward children, and the denial of rights were foundational to the Canadian state project (Tully, 1995; Green, 2001; Coulthard, 2014; Simpson, 2014; Maynard, 2017; TRC, 2015).

The context of Canada's history regarding European colonialism, white colonial settlement and severe oppression of the Indigenous population is shared with its neighbor to the south, the United States (USA). The 13 colonies that rebelled against the Kingdom of Britain in the American Revolutionary War (1775–83) were not joined by the colonies that were to form Canada, despite rebel invasions in the regions of Quebec and Nova Scotia (Ryerson, 1975, 1983). The federal Dominion of Canada was formed through the confederation of several North American British colonies in 1867, just two years after the US Civil War. Three British colonies (the United Province of Canada, New Brunswick and Nova Scotia) became the first four provinces of Canada (Ontario and Quebec, New Brunswick and Nova Scotia), later to be joined by others to constitute the federated state of Canada today.

A common national narrative in Canada is that only in the USA was slavery instituted, while Canada was a place of freedom. This is a myth, as slavery was widespread in Canada. While Canada organized slavery differently from the US in terms of political economy, in both states institutionalized slavery was central to the settler state accumulation projects (Maynard, 2017). Particularly relevant to the historical context regarding social justice in Canada, the United States incorporated and recognized plantation slavery in its core political economy until the end of the American Civil War (1861–65). But the construction of national historical memory is a central feature of modern nation-making (Hobsbawm, 1992). The mythologized notion that Canada has a history of freedom from slavery is consistent with this type of constructed historical memory, one that fits well with the advancement of contemporary multiculturalism.

The historical record, however, runs contrary to the dominant narrative. The colonial territory that is now Canada was, in fact, formally committed to slavery until 1834, when abolition in the British colonial empire was decreed, and enforcement of slave freedom was limited (Winks, 1997; Walker, 2010; Clarke, 2006; Cooper, 2005). Indeed, Canada's first Prime Minister, Sir John A. MacDonald, was a firm supporter of the US South, which was committed to plantation slavery, in the Civil War. A lawyer by profession, MacDonald was the hired advocate for the Copperhead conspirators – an organization which advocated for the victory of the US South by committing vigilante acts of arson and raids on northern cities (Ryerson, 1983, pp. 334–335; Bakan, 2008, pp. 18–19).

Canada's racist practices toward Black residents – many of whom emigrated originally to Canada from the United States as slaves of British loyalists – as well as toward more recent immigrants from the Caribbean, Africa and other regions, is well-documented (Tennyson, 1990; Winks, 1997; Henry and Tator, 2002; Stasiulis and Bakan, 2005; Cooper, 2005; Galabuzi, 2006; McKittrick, 2006; Walker, 2010; Maynard, 2017). Anti-black racism was, and is, consistent with colonial patterns of dispossession and occupation, and the historic commitment to "civilization" as an explicitly European, white settler project.

Canada's original Indigenous population, was, and continues to be, victim to extreme racism and violence. The system of forced residential schooling for Indigenous children has, after considerable denial, finally been acknowledged, most notably in an extensive report by the Truth and Reconciliation Commission of Canada (TRC) (TRC, 2015). Following decades of active organizing among survivors of the residential schools, in 2008 then Prime Minister of Canada Stephen Harper formally apologized to the survivors of this abusive system. The Truth and Reconciliation Commission report concluded, however, that this "promise of reconciliation" had "faded" through inaction (TRC, 2015, p. 8).

The main finding of the TRC was that the residential school system was consistent with the central goals of Canada's policy toward Indigenous, or Aboriginal, peoples, and this was a policy best described as "cultural genocide" (TRC, 2015, p. 1). The schools, as the report noted, were not about education as we commonly understand its meaning. Instead, they were "created for the purpose of separating Aboriginal children from their families" in order to weaken their relationships, and "to indoctrinate children into a new culture – the culture of the legally dominant Euro-Christian Canadian society" (TRC, 2015, p. v). The schools, more like prisons for children, were in place for over a century. They were already established by churches in Canada prior to the country's origin in 1867, and were supported through the 1870s by the Roman Catholic and Protestant missionaries as the settlement project moved across the west and north of the continent. In 1883, the policy of the residential schools was formally endorsed and advanced with federal government support (TRC, 2015, p. 3).

Canada's inclusive multiculturalism stands in an uncomfortable, and contradictory, relationship with a long-denied history and continued daily violence and discrimination against the original inhabitants of Turtle Island (North America) (TRC, 2015, p. 3). Many issues regarding Indigenous peoples in Canada, not only historic but ongoing in present times, have remained unaddressed and unrecognized for decades. For example, a campaign to seek justice for the victimization of Indigenous women, who have gone missing or been found murdered in their hundreds, was met with minimal state and media attention (Razack et al., 2010; Amnesty International Canada, 2022). Only in 2015, after a mass public campaign and the election of Liberal Prime Minister Justin Trudeau, did the federal government announce a commitment to advance a national public inquiry. The findings were published following a contentious process fraught with considerable controversy (Canada, 2019). Ultimately, there were extensive consultations through the National Inquiry into Missing and Murdered Indigenous Women and Girls (MMIWG), including 2386 participants. Among these were 1484 family members and survivors of violence who participated in 15 community hearings and provided testimony; 819 individuals sharing artistic expressions; and the contributions of 83 elders, knowledge keepers and officials (Canada, 2019). Between 1980 and 2012, Indigenous women were estimated to comprise 16% of all female homicides, despite representing only 4% of the female population. This is a number reported by the Royal Canadian Mounted Police (RCMP) and considered to be an underestimation (Canada, 2019, p. 55). Indeed, the Final Report of the National Inquiry concluded that the Canadian state's acts against Indigenous people, "including violence against Indigenous women, girls and 2SLGBTQIA people", were consistent with the definition of "genocide" (Canada 2019, p. 54).

For too many, however, the consultations were far too late, as many lives were lost in the years of advocacy when the government refused to even acknowledge the reality of the violence (Palmater, 2021). This is illustrative of a pattern of reluctant, partial and limited accommodation to long-standing demands for Indigenous rights, forwarded in the language of recognition. The pattern marks a form of colonial politics that continues, and has become the subject of considerable analysis and challenge (Coulthard, 2014; Simpson, 2014). There are numerous other examples to confirm this pattern of inclusive rhetoric belied by experiences of overt racism and dispossession, only a few of which can be addressed in this brief discussion. This brings us to consider the wider systemic features associated with citizenship, identity and difference.

From immigration to security to pandemic politics

Canada's original infrastructure is seeped in colonialism and racism. The extensive railroad system, built by the Canadian Pacific Railway through the early 1880s, depended on tens of thousands of laborers from China who worked in dangerous conditions without legal rights. Fearing that these workers, almost all male, would immigrate to Canada permanently, a prohibitive head tax was levied by the federal government, through the Chinese Immigration Act of 1885. Decades later, the Act was superseded by the Chinese Immigration Act of 1923, also known as the Chinese Exclusion Act (Fernando, 2011). This act was repealed in 1948. Only in 2006, however, after decades of organizing and demanding redress, was a formal apology and some compensation extended by Prime Minister Stephen Harper (Prime Minister's Office's, 2006).

While the case of the Chinese head tax is one example, the practice of formal state restrictions of unwanted immigrants is widespread. It has affected numerous communities in Canada and internationally. Taking another example, in May of 1914, a ship arrived on Canada's western shore, in the city of Vancouver, British Columbia, with 376 Sikh, Hindu and Muslim passengers from the Punjab, India. The Komagatu Maru was not allowed to disembark, despite a concerted legal challenge raised by Vancouver's South Asian community. After being docked with its passengers in the harbor for two months, the ship was forced to return to India. Immigration from India was virtually frozen for the next 25 years (Miki, 2004, p. 22; Dhamoon et al., 2019; Coloma and Pon, 2017). Anti-Asian racism has continued in Canada, increasing in times of crisis such as the COVID-19 global pandemic (Claxton et al., 2021).

Immigration controls have often tightened in times of crisis, on claimed grounds of security, or protection of limited employment opportunities. But what has also increased is discrimination against those considered to "look like" immigrants, regardless of legal citizenship status. During World War II, when Canadian soldiers participated with the Allied powers, Japanese Canadians were treated as enemies at home. Between 1941 and 1943, a series of federal orders-in-council denied equal rights to Japanese Canadians.

These rulings required the registration, fingerprinting, forced movement to designated “protected” areas, confiscation of property and the deportation of Japanese Canadians. These actions were ostensibly on grounds of security, on the unfounded assumption that sympathy with Japan and the Axis powers could be assumed by racial profiling. Significantly, no charges were laid, but trials or hearings were held ([Canadian Japanese Internment Camps, 2011](#); [Johnson and Enomoto, 2007](#)). Neither was this experience of racial profiling, however, invented when security threats were asserted. There is a long earlier history of provincial and federal legal restrictions of Asian Canadians, including the 1897 British Columbia Elections Act which denied the franchise to citizens of “Asiatic” origin ([Fernando, 2011](#)).

In 1988, after decades of organizing to demand an apology and compensation, the National Association of Japanese Canadians saw the federal government, under the administration of Prime Minister Brian Mulroney, sign the Japanese Canadian Redress Agreement. This agreement was signed in the aftermath of the 1982 Constitution Act, which included the Canadian Charter of Rights and Freedoms. The Charter was explicitly noted in the redress agreement, which was understood to afford minority communities the right to protection against the recurrence of discriminatory treatment ([Miki, 2004](#), pp. 317–318; [CRRF, 2022](#)).

The wartime history of Canada holds other examples of such contradictions in terms of social justice and citizenship. The public claim to be committed to protecting democracy from Hitler’s Nazis during World War II was not matched by compassion for victims of anti-Jewish racism, or anti-Semitism, at home. In fact, the Canadian government’s policy toward the plights of Jewish refugees fleeing the Nazi Holocaust was summarized in the statement of Frederick Charles Blair, the director of the Immigration Branch of the wartime government of Liberal Party Prime Minister William Lyon Mackenzie King, as “None is too many” ([Abella and Troper, 1983](#)).

Over the course of the post-war years, Canada’s immigration policy was amended to meet the demands of a growing labor market. But still, this was not universal, as some sectors, such as foreign live-in domestic care workers, saw working conditions in Canada decline as other migration options for women workers from countries in the global South tightened ([Bakan and Stasiulis, 1997](#); [Stasiulis and Bakan, 2005](#)).

The Canadian economy as a whole has greatly benefited from the labor of millions of new immigrants, while changes in Canada’s political economy have affected the contemporary context ([Kellogg, 2015](#)). The 1960s saw a period of reform in immigration policy, with high demand for foreign labor, particularly skilled labor. Considered on a world scale, Canada is a nation where there is a relatively high level of acceptance of new immigrants ([Kymlicka, 2010](#), p. 7). Yet, these indicators belie other trends in immigration, including restrictive policies in other states globally, and unequal conditions among immigrants to Canada based on class, gender and race ([Galabuzi, 2006](#); [Stasiulis and Bakan, 2005](#)). Though certain categories of immigration, particularly those geared to family unification, opened opportunities to communities from countries of the global South that had historically been unwelcome to reside permanently in the country, this was neither universal nor consistent over time.

Canada’s immigration and citizenship policies have generally tightened in the 21st century. Issues regarding immigration and citizenship have been influenced by public debates on security. Racial profiling of Black and Indigenous Canadians, regardless of citizenship status, continues despite documentation of clear violation of principles of human rights ([TRC, 2015](#); [Maynard, 2017](#)). Neither is there a linear progression of increasing rights over time. The Canadian government readily allied itself with the United States and other Western powers following the 9/11 attack on the Pentagon and the World Trade Center. However, policy amendments relied on racial and cultural stereotypes, rather than protection of Canadian civil and human rights ([Thobani, 2002](#)). A significant example is the case of Maher Arar, a dual Canadian and Syrian citizen, who, while traveling in 2002, was detained by US authorities on suspicion of being a member of Al Qa’ida, the terrorist organization associated with the 9/11 attacks. The details of Arar’s experience are significant. His story struck a chord with many immigrant and Canadian Muslim families in Canada, who expected to be welcomed and recognized as part of the multicultural state ([Dhamoon and Abu-Laban, 2009](#)). Arar had immigrated to Canada from his native Syria at the age of 17, where he received a post-secondary education and, by the age of 32, was established as a highly skilled telecommunications engineer. He was married and the father of two children. On September 26, 2002, Arar was traveling on a Canadian passport, returning to his home in Canada by way of New York, following a family holiday in Tunisia. He was detained in the Kennedy Airport in New York by US officials and held in solitary confinement until October 2, 2002. Despite the interventions of his family and a US-based lawyer, US Immigration and Naturalization Services officials advanced accusations that Arar was a member of Al Qa’ida. On the basis of these unfounded accusations, he was deported and remained in prison and tortured in Syria until October 5, 2003 ([Abu-Laban and Nath, 2007](#)). Only following a concerted campaign led by his wife, Monia Mazigh, and other supporters, was Arar released and returned to his home in Ottawa, Canada. Public support to investigate the case and clear Arar’s name continued, resulting in several formal investigations ([Abu-Laban and Nath, 2007](#)). As a result of the findings, Arar was eventually cleared of all wrongdoing. In 2007, then Canadian Prime Minister Stephen Harper issued an official apology and financial compensation for this act of extraordinary rendition to another state, in recognition of the damage caused to Arar and his family.

While security claims have continued to be adopted to justify discrimination against racialized groups rendering more difficult the transition for immigrants to full legal citizenship status, all forms of inequality have been revealed and intensified in the conditions of the pandemic virus COVID-19. The global pandemic, declared by the World Health Organization in March 2020 ([WHO, 2020](#)), has revealed this pattern internationally, and Canada has been no exception. While the virus threatens lives universally, those in precarious work and living situations, with limited access to healthcare, and suffering from poor health associated with discrimination and poverty have face heightened risks. Internationally, there has been a marked rise in anti-Asian racism, including racial profiling, hate crimes and social media targeting ([He et al., 2021](#); [Gover et al., 2020](#)). Moreover, persistent social and economic inequalities have proven life-threatening in pandemic conditions, indicating ethnic minorities, the poor and the elderly are

particularly vulnerable (Ali et al., 2020). Black, Indigenous and people of color populations have disproportionately suffered from COVID-19 in Canada as well as internationally (Dei and Lewis, 2020). Black families face significantly higher rates of poverty in Canada, with approximately 50% of the Black Canadian population “categorized as low income, with that number jumping to 65% for new Black immigrants” (UN General Assembly Human Rights Council 2017, p. 12).

Conclusion: implications for education for citizenship

These historical and contemporary contexts regarding identities, difference and citizenship suggest important implications for education.

Canada’s national project has been strongly aligned with the achievements of British colonialism. At the same time, the country’s growth has been centrally dependent on immigration, largely from nations in the global South, to fuel its expanding labor force and population. An historic reliance on an assimilationist conception of citizenship was expressed largely through the education system (Heath, 2002). Loyalist notions of Christianity, patriarchy and state authority were carried by educational theorists such as Egerton Ryerson (1803–82), after whom a major Canadian university was named (see Pearson, 1988; Dellaire and Ellis, 2021). Indeed, Ryerson’s commitment to public education for children of Canadian settlers was coincident with his advocacy for residential schools for Indigenous children, understood as two sides of the colonial project (Dellaire and Ellis, 2021). Schools have therefore been sites of deep contention, with teachers, students, parents and scholars leading movements for increased access and equality for marginalized communities, and for redress and measures to mitigate acknowledged patterns of discrimination (Banks, 2004). Following consistent pressure raised within and beyond Ryerson University for over a decade, a university task force to investigate the legacy and implications recommended changing the name of the institution, to no longer recognize a person so deeply implicated in the system of residential schools and related discriminatory and harmful acts. In 2022, the university adopted a new name, as Toronto Metropolitan University. This is a limited reform, but it is reflective of the pattern of transformation following concerted efforts and resistance.

Formal citizenship education has expanded in Canada. While ideals of social justice, diversity and inclusion are more common in educational curricula, these goals are compromised by an emphasis on a singular, uniform Canadian national identity (Pashby, 2014), one which continues to perpetuate systemic discrimination (James, 2007; Mujawamariya, 2007; Dei et al., 1997). Scholars of social justice have forwarded innovative theorizations to address these contradictory trends, positing the concept, for example, of negotiated citizenship (Stasiulis and Bakan, 2005). Citizenship, as argued here, needs to be understood as more than legal status alone, existing “on a spectrum, involving a pool of rights that are variously offered, denied, or challenged, as well as a set of obligations that are unequally demanded” (Stasiulis and Bakan, 2005, p. 2). Viewed in this way, citizens and non-citizens can be seen to continually challenge various restrictions and barriers, while also collectively negotiating to advance rights and freedoms.

Within education broadly defined to embrace experiential learning beyond the school classroom, there are also contested ideas. The adoption of formal multiculturalism policy in the 1970s and the expansion of constitutional rights in the 1980s are notable markers. The contradictions between policy and reality however, have generated significant resistance, and this is a story that is still in the telling. Canada is the chosen home of millions of people from around the world, while it also remains the place of residence to Indigenous peoples from time immemorial. For those born in other nations, obtaining legal citizenship in Canada requires meeting a series of complex requirements, ultimately including an affirmation of an oath of loyalty. This oath calls for a promise to “bear true allegiance” to Her Majesty Queen Elizabeth II, “Queen of Canada”, as well as to her heirs and successors, and to observe the laws of the land. The oath, along with various other rights and responsibilities of citizenship, is described in Discover Canada, the study guide for those seeking citizenship published by Citizenship and Immigration Canada (Canada, 2022). While the content of this text emphasizes multiculturalism, gender equity – including same-sex marriage and women’s rights – and diversity, the commitment to the Queen as the sovereign personified reveals the contradictory character of Canadian citizenship and the continued colonialism in theory and practice. This complex spectrum demands continued study and research, and a central commitment to the theory and practice of social justice education.

While the country case study of Canada is specific, the experiences of colonialism, dispossession, racism, exploitation, sexism and gender discrimination, are painfully common among nations and populations across the globe. Indeed, the case of Canada is notable, arguably, as a “best case” scenario of modern neoliberal capitalism in terms of its promise of inclusive democracy and equality. Canada is widely taken as a model state, raised as an ideal type to be emulated and with exemplary lessons that can be shared internationally (Stasiulis and Bakan, 2005). This is demonstrated, for example, in the elevation of a school of Canadian political theory, drawn from examples of multiculturalism in Canada and generalized to apply to liberal democratic states as a model of governance (see for example Kymlicka, 1995, 2001, 2010; Taylor, 2004, 2009). Canada is framed as a place of refuge, and certainly it is the home to many thousands who have fled onerous and often life-threatening conditions. It is precisely this elevated status, however, that compels a closer look at the realities of oppressive and colonial practices in Canada, not least to expose the realities and intransigence of systemic discrimination. As the discussion presented above has demonstrated, the rhetoric outstrips, and covers for, a very different reality, and merits continued action and support for profound social transformation. Surely, a better world is possible.

Introduction

The world has observed the expanding scale and pace of international migration for the past decades, although this is not phenomenon unique to this time. As of 2019, the total number of international migrants is 271.6 million, which accounts for 3.5% of the world's population ([International Organization for Migration, 2019](#)). The number of international migrants has increased approximately by 50 million every ten years in the 21st century—173.6 million in 2000, 220.8 million in 2010, and 271.6 million in 2020 ([United Nations, Department of Economic and Social Affairs, Population Division, 2019](#)).

Migration has become a major indicator of the ever-increasing interdependencies and complexities of global society. The expansion of global trade, integration of labor markets, and proliferation of supranational governing organizations collectively signaled the acceleration of large-scale migration along with the diminishing power of individual nation-states and increasingly permeable borders. Given that migrants have often been subjected to the unwarranted accusation that they are a source of social problems and a threat to national security, their historical and contemporary contributions to countries of origin as well as countries of destination have long been overlooked. Migration has been proven to play a significant role in economic growth, technological innovation, social dynamism, and cultural diversity across the world ([International Organization for Migration, 2019](#)).

In light of the increasing migration flow worldwide, a sense of urgency about reconceptualizing what it means to be a citizen, and how to implement citizenship education has grown. Ideas regarding citizenship and citizenship education, “once solely and firmly the domain of national citizens,” have come to transcend national boundaries, being “reconstituted around a constellation of multiple affiliations including race·ethnicity, gender, place, and class to name a few” ([Gaudelli, 2009](#), p. 69). Assimilationist practices rooted in the dominant form of citizenship education in the 20th century requesting migrants to abandon their ethnic, linguistic, and cultural characteristics for the sake of unity and social cohesion of the host society, and resulting in the marginalization and discrimination of migrant learners in school turned out to be dysfunctional ([Banks, 2017](#); [Coloma, 2017](#); [Suárez-Orozco, 2019](#)). Nation-centric approach to citizenship education has been warned to be harmful to domestic-born mainstream learners as well who might lose significant opportunities to explore some of the most pressing issues at home and abroad and thus fail to develop into informed, competent, and caring global citizens ([Patterson and Choi, 2018](#); [Subedi, 2013](#)).

Global citizenship education has evolved as a discursive space, curricular approach, and practical suggestion for responding to the renewed educational agenda in the era of globalization ([Gaudelli, 2016](#)). From scholars and educators to governments and corporations, many diverse educational stakeholders have discussed the responsibilities of schools and the roles of school curriculum in preparing the next generation to survive and thrive as global citizens. Mindful that school curriculum is a manifestation of the expectations for its citizens and a carrier of official knowledge in a society, (re)orienting what it should look like and how it should work in the critical time of globalization has become a significant task in many countries ([Apple, 2014](#); [Ross, 2014](#)). Despite decades-long scholarly discussions, multi-level policies, and onsite practices, the ultimate question of global citizenship education “whether or not it should be taught and if so, then how” has remained unanswered ([Goren and Yemini, 2017](#), p. 170). The term “global citizenship education” has been utilized with different political, economic, sociocultural aims of multiple stakeholders, which in turn allowed confusion, skepticism, tokenism, and/or disorientation of global citizenship education in practice ([Patterson and Choi, 2018](#)).

The COVID-19 outbreak which plunged the world into fear and confusion added another layer of uncertainty and complexity to this issue. Unlike prior predictions of ever accelerating globalization and increased migration flow, the unexpected worldwide pandemic resulted in border closures, local lockdowns, travel restrictions, and quarantine requirements across the globe. A historical low for international migration was observed in 2020, while the expansion of human mobility has been put on hold ([OECD, 2020](#)). Discourses on migration, citizenship, and school curriculum, collectively as well as respectively, presuppose that human beings live as members of society through relationships with others. At a time when schooling has been disrupted and distancing has become the new norm, educators’ role in rethinking longstanding approaches to citizenship education and constructing more resilient, sustainable communities from the local to the global level have become more critical than ever before.

This chapter explores the intersectionalities of migration, citizenship, and curriculum, placing global citizenship education at the center of its discussion. Through a review of literature on global citizenship education published in the past decade, this article examines the following inquiries: From a theoretical standpoint, what scholarly approaches have emerged in the discourse of global citizenship education? From an empirical view, have official curriculum in different parts of the world portrayed global citizenship, and if so how? Given the COVID-19 pandemic causing a dramatic change and challenge in the realities of migration and globalization in the recent years, uncertainties, complexities, and controversies related to discourses on citizenship education and curriculum are discussed as thoughts for future research.

Theoretical discourses on global citizenship

The growing scale and pace of global migration is a key indicator demonstrating the world's heightening interdependencies, complexities, and transformations. The diversified facets of globalization including globally integrated labor markets, innovative technologies in media and communication, and convenient and affordable cross-border transportation have widely led the escalation of migration across the globe (Suárez-Orozco and Suárez-Orozco, 2010). People living outside their country of birth reached approximately 272 million as of 2019, a number close to the national population of Indonesia (International Organization for Migration, 2019). 38 million of these are international migrants below the age of 20 (United Nations, Department of Economic and Social Affairs, Population Division, 2019). Further attention must be given to the fact that the number of refugees and asylum seekers has continuously risen (United Nations, Department of Economic and Social Affairs, Population Division, 2019). Unresolved issues from local to global including, but not limited to, political insecurity, socioeconomic inequalities, human rights violations, and environmental degradation, have repeatedly caused the forcible displacements of people.

Scholarly discourses on citizenship education have considerably been diverse, convoluted, and contentious. Given the complex, fluid dimensions of globalization and migration, there seems to be a general consensus on the need to expand traditional notions of citizenship beyond national boundaries and to prepare the next generation to live as a global citizenry (Banks et al., 2016; Hahn, 2020). Global citizenship education emerged as a noble idea, worthy goal, and agile response to the urgent agenda of reformulating citizenship education, drawing a wide range of interest and popularity among the general public, scholars, and policy makers in places around the world (Cho and Mosselson, 2017; Yemini et al., 2018). Yet, what an ideal global citizen should look like, how global citizenship can be defined, and what how to whom schools should teach for it have been envisioned differently by a range of educational stakeholders with diverging ontological, epistemological, and ideological stances (Oxley and Morris, 2013). A nationalist hegemony in company with free-market values emphasizes nurturing "productive, self-employable, and competent beings" (Choi and Kim, 2020, p. 2) ready for competition in the globally integrated market as well as framing global citizenship as an extension of national citizenship. On the other hand, critiques call for a systematic reexamination of global hegemony and its associated inequity, oppression, and dehumanization (Banks et al., 2016; Dill, 2013; Evans, 2015; Giroux, 2013). A seemingly apolitical, controversy-free conceptualization of global citizenship education by UNESCO, "building the knowledge, skills, values and attitudes that learners need to be able to contribute to a more inclusive, just and peaceful world" (UNESCO, 2015, p. 15), has been widely cited in scholarly publications, policy documents, and curriculum standards. Yet the term "global" itself has long been a target of criticism by conservatives as a radical, value-laden concept that uproots national sovereignty and state authority (Lourenço, 2018). Scholars and educators have eagerly sought to unpack the multiple meanings, purposes, conceptions, and approaches of and surrounding global citizenship education, drawing upon alternative as well as complementary lenses in efforts to propose more nuanced theoretical frameworks and contextualized curricular models.

This article outlines some of the most influential, widely-used typologies of global citizenship education. In what follows, Andreotti's (2006) soft vs. critical framework, Gaudelli's (2009) heuristics of global citizenship, and Oxley and Morris's (2013) typology identifying eight conceptions of global citizenship education are introduced in sequential order. These broadly recognized, highly-cited works offer a useful overview of diverse theories and curricular approaches shaping the contemporary discussions and practices of citizenship education in the age of globalization and migration.

Andreotti (2006) identifies a twofold framework of soft vs. critical global citizenship education, contrasting opposing views, ideals, and approaches in the field. Soft global citizenship education, currently the dominant form in practice, seeks to raise awareness of the world and cultural diversity at large. It suggests economic progressivism as a solution to the problems in question, while referring to the individual level of moral responsibility and humanity as a ground for change (pp. 46–47). Critical global citizenship education advocates empowering learners to reflectively analyze the Western, colonial legacies of global power relations and intellectual production, and to participate in informed, responsible, and ethical actions for problem solving (pp. 46–47).

Gaudelli (2009) provides a heuristics of global citizenship, identifying five distinctive approaches that shape contemporary scholarly discussions and curricular implementations. These five approaches center around national, neoliberal, Marxist, world justice and governance, and cosmopolitan conceptions. According to this model, the national (building on inviolable sovereignty of national governments and promoting a sense of shared national belonging) and neoliberal (rooted in nationalism yet framing people as transformative agents who can make the most of the global economy, thus emphasizing utility-based knowledge) approaches have been hegemonic forms of citizenship discourses (pp. 69–72). Meanwhile, the Marxist (advocating empowerment of the oppressed as a resolution to the exploitative nature of globalization and featuring critical pedagogy as its method), world justice and governance (prioritizing universal humanity and peace by means of codified human rights and institutionalized civil

actions), and cosmopolitan (seeking further imaginary, dialogic, and esthetic modes of discussion of civil identities, cultural pluralism, and moral values) views, though being marginal in practice, have emerged as meaningful counter-narratives to the former ones (pp. 73–77).

Oxley and Morris (2013) propose a comprehensive typology of eight conceptions of global citizenship in an effort to map out disparate theoretical underpinnings in the field. This typology features two broad types of citizenship ideals, each with four distinctive conceptions. The cosmopolitan type, often interpreted as a neo-imperial form of global citizenship, includes the following: political (envisioning a well-ordered world through the strengthening and democratizing of supranational institutions), moral (promoting global ethic on the basis of universal humanitarianism), economic (focusing on international development in favor of capitalism, neoliberalism, and/or corporate philanthropic activities), and cultural (celebrating multiculturalism and pursuing the globalization of arts, media, languages, sciences, and technologies) conceptions (pp. 305–311). The advocacy type refers to a more holistic, anti-individualistic views, which incorporates social (being attentive to the intersectionalities of multicultural identities and marginalized voices), critical (calling for action to challenge prevailing inequalities, discriminations, and oppressions around the world), environmental (supporting sustainable development based on human responsibility toward nature), and spiritual (finding meanings in the non-scientific, immeasurable aspects of human relations; namely, love, care, and emotions) conceptions (pp. 311–315).

Such scholarly endeavors contributed to enrich our understanding of the global citizenship education theories that have emerged in the context of increased migration and globalization. These frameworks, synthesizing and visualizing multifariously intricate arguments and imaginaries in the discursive space of global citizenship education, have been applied extensively as useful analytic lenses into educational policies and curricular practices. They have also served as guiding principles for many subsequent models in the field (Goren and Yemini, 2017). Complications within and across these multiple models are evident, yet interpretable as encouragement, instead of trouble, aiming toward more open debates and inclusive conversations in the scholarship.

Although drawing upon diverse methodological approaches and utilizing different methods of categorization, these aforementioned typologies in common feature the limits and dangers of neoliberal rhetoric and nationalist visions of citizenship. Scholars have warned that such “subtractive” (Valenzuela and Brewer, 2010) notions not only fail to reflect the realities of an integrated world and people, but also limit the opportunities of all learners to thrive as informed, competent, and caring participants of the globe (Banks, 2016). A self-reflective criticism of the scholarship itself has also been identified; namely, that it is geared toward a Western, Northern, liberal democratic subject as the desirable norm of global citizenship given the overrepresentation of existing literature from English-speaking, Western countries (Pashby et al., 2020). Subsequent theoretical research has tended to put emphasis on the need for (post-)critical approaches and post-colonial imaginaries toward global citizenship education in practice (Andreotti, 2014; Stein, 2015).

Curricular practices of global citizenship education

In conjunction with the expansion of scholarly discussions, the ways in which global citizenship education is articulated through school curriculum has received a growing empirical interest. A large volume of prior research on such inquiry has dominantly been conducted in Western societies that have been traditionally desirable destinations for global migrants; namely, Europe and North America. In recent decades, global migration patterns have become more complex with a broader regional scope, while the division between sending and hosting countries has collapsed (International Organization for Migration, 2019). As the citizenship status and self-defined identities of migrants have become more diverse and fluid, growing attentions to school curriculum for global citizenship have been observable in a wider range of regions around the world (Alviar-Martin and Baidon, 2016; Goren and Yemini, 2016; Koh, 2017; Pan, 2011; Patterson and Choi, 2018; Suárez, 2008; Quaynor, 2015). The recent scholarship has largely advocated localized, contextualized global citizenship curriculum design and implementation taking into account diverse historical backgrounds, political systems, religious beliefs, economic interests, geopolitical locations, public sentiments each society has been situated within. Meanwhile, concerted international efforts toward curriculum design to ensure shared goals of peace, equality, cultural diversity, and sustainable development of the globe has been emphasized by supranational institutions (UNESCO, 2020). Topics addressed in research have become more diverse as well. Whether and to what extent global citizenship related knowledge, disposition, skills, values and attitudes are portrayed in formal school curricula has been a significant line of inquiry (Choi and Kim, 2020; Goren and Yemini, 2017; Ideland and Malmberg, 2014). In what ways migration is discoursed in the curriculum and such curriculum (dis)serves the needs and interests of migrants has been an issue of particular interest in the context of proliferating human migration (Quaynor and Murillo, 2018). A burgeoning number of empirical studies focusing on the enacted dimension of curricula, have investigated the ways in which global citizenship curriculum is experienced in the everyday realities of school (Goren and Yemini, 2016; Kim, 2019; Hahn, 2020; Rappoport, 2010; Rios-Rojas, 2018; Verma, 2017).

This section presents a sketch of literature dealing with the place of global citizenship education in the formal school curriculum around the world. Despite the significance of understanding the enacted aspects of curriculum implementation, this article sheds light on the official curriculum (e.g., policy documents, local-regional-national curriculum standards, and textbooks) to make better sense of how global citizenship education is intended and narrated in the prescriptive curriculum that mirrors the official knowledge and desired civic virtue of a given society (Apple, 2014). Drawing upon some of the most recent empirical research on the formal curriculum practices of global citizenship education around the world, this section discusses the current research findings in the field.

The ways in which the formal curriculum (dis)employs and (dis)articulates global citizenship have been actively investigated in research across the world. A significant number of studies has been published in the contexts of and by scholars from the so called 'first world', Western, English-speaking, democratic societies (i.e., the US and Canada), which have typically been the most popular destinations for global migrants. These studies in large have explored the portrayal of global citizenship and the treatment of non-Western regions and people in school curricula (Rapoport, 2009; Swanson and Pashby, 2016; Subedi, 2013). In the recent decade, various curricular approaches to global citizenship education in Western societies with diverse linguistic, political, geographical, and/or academic backgrounds for example, Australia and New Zealand in Oceania (Peterson et al., 2018) and European countries including Finland (Andreotti et al., 2015), Sweden (Ideland and Malmberg, 2014), the Netherlands (Weiner, 2018), Poland (Leek, 2016), Austria, Bulgaria, the Czech Republic, Ireland, Italy, Latvia, Spain, and Portugal (Tarozzi and Inguaggiato, 2018) have been reported. Diverse cases from and between other regions including South Korea (Choi and Kim, 2020), Singapore, and Hong Kong in Asia (Alviar-Martin and Baidon, 2016); Ghana in Africa (Arnot et al., 2018); and Argentina, Brazil, Chile, Colombia, Costa Rica, Cuba, Ecuador, Nicaragua, Peru, and Venezuela in Latin America (Poorter and Aguilar-Forero, 2020; Sant and González Valencia, 2018) have also been examined. Collectively, these examinations have enriched our understanding of how nations around the world shape global citizenship discourses via the school curriculum. Such line of inquiry has been of particular interest in countries where government-led curricular initiatives with high levels of prescription strongly impact everyday teaching and learning practices in schools.

A growing body of empirical evidence from the previous literature has argued that the position of global citizenship in formal school curricula around the world has been ambiguous, fragile, and troubling. Although there have been widely-shared commitments to global citizenship education, official school curricula in many developed nations have reportedly been riddled with simplistic, superficial portrayals of the world; apolitical approaches to highly controversial global issues; and a subtractive, instead of inclusive, ethos of citizenship with strong nationalist and neoliberal agendas (Goren and Yemini, 2017; Peterson et al., 2018). National exceptionalism along with dichotomous distinctions between tradition vs. civilization, dirtiness vs. purity, chaos vs. order, ignorance vs. morality, and helped vs. helping seems still apparent, while stories of contemporary migration as part of global and national citizenship have been largely excluded (Ideland and Malmberg, 2014; Quaynor and Murillo, 2018; Weiner, 2018). When these narratives are included, discussions of migration tend to be couched in historical and abstract terms, celebrating contributions of migrants who have seamlessly assimilated themselves into host societies (Patterson and Choi, 2018, p. 488). Concerned scholars warn that the current form of curricula is likely to inhibit opportunities for critical thinking and reflective actions, "dissuading students' analysis of their own complicity in global injustices and the moral dimensions of living in an interrelated world" (Patterson and Choi, 2016, p. 170).

The distinctive issues and concerns of the abovementioned lesser-studied regions deserve further attention. For instance, studies on South Korea, Singapore, and Hong Kong have identified a shared concern regarding the limitations of the state-approved citizenship education curriculum, which employs a narrow sense of nationalism and relies on an unquestioned utilitarian agenda (Alviar-Martin and Baidon, 2016; Choi and Kim, 2020). For these societies that share a common experience of colonial rule, that have adopted a Western model of development, and that have grown into economically affluent cosmopolitan cities, focusing their curricula on building a unitary national identity and nurturing citizens with marketable knowledge and skills in order to compete in the global age could be part of a strategic survival method, contextualized decision-making, and/or a consequence of the colonial past (Patterson and Choi, 2018).

The conflicting ethos between Western notions of the competitive, individualized, active citizen and community-oriented civic identities and virtues based on indigenous cultures appear at the heart of the postcolonial dilemmas in Ghana and other places in Africa (Arnot et al., 2018). "The mixing of national unity and patriotism with the principles of children's rights and equity and with neo-liberal agendas around individualization, enterprise and competing environmental and development goals" (p. 123) has been an uneasy task that the Ghanaian school curriculum has juggled with.

In Latin America, curricular approaches to global citizenship education have been ideologically and geopolitically divided. The concept of global citizenship is only explicitly discussed in the educational policies of some pro-globalization and market-oriented countries including Chile, Colombia, and Peru. Other countries such as Cuba and Brazil with their proclaimed notions of anti-imperialism have challenged the dominance of Western civilization discourses and the prominent understanding of global citizenship conceptualized by supranational authorities founded on imperial legacies. Instead, these countries have advocated the critical examination of the global power relations, reflecting regional voices and demands as alternatives (Sant and González Valencia, 2018).

The influence and enforcement of national policies, textbooks, and curriculum standards may vary from country to country. Yet, the limitations, dilemmas, and challenges evident in the official curriculum for global citizenship are most likely to impact how the curriculum is enacted in the realities of school. This is particularly true given the current emphasis on the importance of the accountability system and high-stakes testing (Evans, 2015). Reflecting on how the wars, imperialism, and colonial history of the 20th century affect global citizenship education and its associated curricular practices in the 21st century and searching for the commonalities and differences within and between regions having diverse historical, political, economic, and sociocultural contexts through a comparative lens can offer meaningful insights and lessons for educators envisioning how the curriculum should move forward.

Moving forward during and after COVID-19

Citizenship, curriculum, and migration, together and apart, are context-sensitive subjects that reflect both the specificities of locals and complexities of global circumstances. In anticipation of deepening globalization and expanding cross-border migration, continuous engagements in research on the fluid concept of global citizenship education along with praxis-oriented efforts to implement contextually meaningful, nuanced curricula for diverse learners have strongly been called for. The COVID-19 pandemic brought unexpected challenges, further uncertainties, and complex questions to the already confusing, divergent field of citizenship education. Throughout and since the COVID-19 outbreak, the world has experienced the most severe restrictions on and the most rapid decline in global human mobility in modern times (Chamie, 2020). As of 2020, 120 countries have reportedly ordered border shut-downs with travel restrictions on foreign arrivals (Gamlen, 2020). Anti-migrant, xenophobic sentiments appeared to intensify while migrants were accused of accelerating the spread of the infectious disease and further burdening the shrinking economy (OECD, 2020). If and how the pandemic signifies “a temporary trough in global population movements, or the end of the most recent age of migration” (Gamlen, 2020, p. 2) is a pressing question that has been receiving close attention from academia as well as the general public.

World-wide school closures as a consequence of the pandemic have reportedly yielded inequities in public education and constricted the meaning of learners as social beings and learning as a social interaction. As of 2020, over 190 countries closed all of their primary and secondary schools, though in varying periods of time, affecting 1.5 billion students and 63 million teachers (Bryant et al., 2020, April 21; Waters, 2020). Physical distancing within and outside the classroom was encouraged on days when students attended school in person. It has not been unusual that students wearing masks sit at desks with partitions as far away as possible from other classmates, and/or engaging in individual study without social contact. The pandemic has caused much more than simply the discontinuity of public schooling and the expansion of online classes. Self-directed learning emerged as trendy jargon given the expansion of remote learning, yet too often resulted in the learning loss, achievement gaps, and social isolation of already underserved students in vulnerable situations including, students of color, migrant youth, linguistic minorities, and children in lower-income families (Dorn et al., 2020 December 8; Sonnemann and Goss, 2020).

Questions, concerns, and possibilities regarding the direction of citizenship education and the roles of curriculum have risen amid the greater uncertainties and weaker sense of belonging produced by COVID-19. At a time when the fragility of linear progress and modernity has been greatly tested, will global citizenship education within and across nations remain consistent with strong positivistic, colonial assumptions? Or will it shift toward a more critical examination of human development? While borders are closed and migrants' movement is restricted under the authority of individual states, how should the ideas of citizen, citizenship, and citizenship education be revisited? Are school curricula in many countries around the globe going to fortify their existing nationalistic, patriotic focus, or will they become more inclusive and globally-oriented, emphasizing cosmopolitanism to overcome this global crisis together? In what ways will COVID-19 be taught as a global issue in post-pandemic era classrooms? How much will the treatment of and response to this issue vary in school curricula from region to region? If and how will the portrayal of migration and migrants, which have largely been marginalized or instrumentally used if included in the curricula, be transformed? Will COVID-19 fuel the proliferation of online-based, AI-assisted remote learning? Or will it restore the longstanding values of community building, social interaction, and collaborative learning in citizenship education classrooms? In the post pandemic era, will global citizenship education become an exclusive domain of affluent learners with access to advanced communication technologies and able to travel internationally? Or will it be more accessible to individuals from underprivileged regions, providing a wider range of information and greater exposure to the world?

The roles and responsibilities of scholars, policy makers, and practitioners to continuously reflect on the past, question the present, and imagine the future of global citizenship education appear more urgent than ever before in order to responsibly cope with this unforeseen global crisis and to carefully prepare for the post-pandemic era.

Conclusion

This chapter concludes with a call for educators' responsible participation in the discursive spaces of global citizenship education and its curricular implementations. In the body of existing literature on the nexus between migration, citizenship education, and curriculum, there seems to be a disparity between a critical, post-colonial focus in its theoretical arguments and, on the other hand, the nationalistic, neoliberal rhetoric dominant in the realities of curricular practice (Goren and Yemini, 2017). Citizenship education and school curricula displaying their commitment to global citizenship in many parts of the world have reportedly exhibited an overriding apolitical approach to the most controversial global issues, negligence in terms of the global citizenry's civic obligations by emphasizing national demands, and a subtractive lens with either-or distinctions limiting the voices of the marginalized. Scholars have criticized the failure of governments, policies, and official curricula to provide more democratic, justice-oriented visions of citizenship education for schools, while also searching for context-specific explanations and alternatives. This article invites committed educators at all levels to persistently question and revisit global citizenship education to ensure more humane, democratic, and ethical implementations for all learners. Moving forward, diversified curricular imaginations and pedagogical experimentations of what is possible and how it can be done from various ontological, epistemological, theoretical, and methodological lenses will be as significant as investigating the failures and complexity of curricula.

Globalizing scholarship on global citizenship education itself is also strongly encouraged. Mindful of the continuity of modern, colonial assumptions and strong influences of the “first world” in the scholarship which can be “inherently violent and unsustainable” (Pashby et al., 2020, p. 160), voices and stories from diverse regions and people that have traditionally been lesser-known in particular, are welcomed to be highlighted. It is imperative for scholarship on global citizenship education to offer more open, inclusive, and cosmopolitan discursive spaces that can enable in-depth explorations of how we teach and learn beyond Western-centric assumptions and colonial legacies. Comparative analyses on the intersections between these explorations can provide valuable insights regarding the concerted efforts that can be made by responsible educators around the world to foreground justice, equity, and, diversity in global citizenship education. Such endeavors will be even more meaningful during and after the era of deepening global instabilities and uncertainties caused by COVID-19, when the importance of international cooperation and solidarity, the protection of universal human rights and safety, and the construction of a healthy and sustainable global society are more critical than ever before.

Introduction

Before, I was not aware of my rights. Now, I am aware of all of them. I have the courage to stand up for myself and to ask for my rights when I am denied them.

Premalatha Tamilselvan (HREA et al., 2012)

Premalatha Tamilselvan is a young woman from India who participated in a human rights class in her school as a child. Organized by the non-profit organization, People’s Watch, with support from UN Human Rights, this program trained teachers to bring human rights education to their classrooms. For Premalatha, who is a member of the Dalit community, once known as “Untouchables” and the lowest caste in India, the human rights class was life changing. Now, at the age of 21, she plans to become a lawyer in order to advocate for the human rights of others (Office of the United Nations High Commissioner for Human Rights, 2020a).

Goals and concepts of human rights education

Human rights education (HRE) is a newly established field of educational theory and practice with increasing attention and significance across the globe. This effort, which has gained momentum since the early 1990s, has generated a growing body of educational theory, practice and research that often intersects with activities in other fields of educational study in schools, such as citizenship education, peace education, anti-racism education, Holocaust/genocide education, education for sustainable development and education for intercultural understanding. However, HRE is not only aimed at the formal education sector but has deep

roots in non-formal education, such as non-profit organizations and after school clubs, and also takes place in the training of professionals, such as social workers, teachers and law enforcement officials.

Inter-governmental organizations, including the United Nations, and regional human rights entities, such as the Council of Europe, have promoted HRE in policies and practices. In (UNGA, 2005), the United Nations General Assembly created the permanent and ongoing World Programme for Human Rights Education and, in 2011, passed the Declaration on Human Rights Education and Training. From the UN point of view, knowledge about human rights by all actors in society is fundamental to the virtuous cycle of people knowing and claiming their rights, and governments being held accountable for their human rights promises.

Purpose and structure of the chapter

This chapter shares a brief history and current overview of HRE today, with snapshots of HRE in practice in various contexts across the globe. First explaining HRE through definitions and models of teaching and learning, it then examines HRE with a critical eye. Following this, in connecting theory to practice, the chapter offers examples of HRE in formal, non-formal, and professional settings, as a means of instilling values, sharing knowledge, and training in skills to advocate for human rights.

Background on HRE

Definition of HRE

The most widely accepted definition of HRE is that offered by the United Nations, whose General Assembly passed in December 2011 a Declaration on Human Rights Education and Training with the following language (Article 2):

1. Human rights education and training comprises all educational, training, information, awareness-raising and learning activities aimed at promoting universal respect for and observance of all human rights and fundamental freedoms and thus contributing, inter alia, to the prevention of human rights violations and abuses by providing persons with knowledge, skills and understanding and developing their attitudes and behaviors, to empower them to contribute to the building and promotion of a universal culture of human rights.

This paragraph reaffirms the UN's long-standing definition that HRE has a place in all forms of education and training, including the formal, nonformal and informal sectors. As with other educational processes, HRE has components of knowledge, skills and attitudes, which should be consistent with recognized human rights principles and empower individuals and groups to address oppression and injustice.

The [Office of the United Nations High Commissioner for Human Rights \(2011\)](#) offers further explanation of what HRE encompasses:

- (a) Education *about* human rights, which includes providing knowledge and understanding of human rights norms and principles, the values that underpin them and the mechanisms for their protection;
- (b) Education *through* human rights, which includes learning and teaching in a way that respects the rights of both educators and learners; and
- (c) Education *for* human rights, which includes empowering persons to enjoy and exercise their rights and to respect and uphold the rights of others (Article 2, para 2) (Office of the United Nations High Commissioner for Human Rights, 2011).

This paragraph reflects the evolution of HRE practice, as education *about*, *through* and *for* human rights affirms the full spectrum of learner goals in accordance with knowledge/understanding, values, capacities and actions, with a framework of human dignity and personal empowerment. This new, extended definition also draws attention to teaching and learning processes and reaffirms the outcomes of HRE as being oriented towards taking action “for” human rights.

History of HRE

With the adoption by the United Nations of the Universal Declaration of Human Rights (UDHR) in 1948, HRE was considered crucial to the realization of human rights for all people. In the preamble to the UDHR, it states,

Whereas a common understanding of these rights and freedoms is of the greatest importance for the full realization of this pledge,

Now, Therefore THE GENERAL ASSEMBLY proclaims THIS UNIVERSAL DECLARATION OF HUMAN RIGHTS as a common standard of achievement for all peoples and all nations, to the end that every individual and every organ of society, keeping this Declaration constantly in mind, shall strive by *teaching and education* to promote respect for these rights and freedoms ... (emphasis added). (United Nations, 1948)

Soon after the adoption of the UDHR, the United Nations launched educational campaigns to promote rights. In 1951, UNESCO launched an educational campaign to dispel false and discriminatory information regarding race. UNESCO's (1974) Recommendation concerning Education for International Understanding, Cooperation and Peace, and Education Relating to Human Rights and Fundamental Freedoms, officially called for education to advance human rights. Four years later, the first official definition of HRE was created by the International Federation of Teachers in 1978, which stated:

Human rights education and teaching must aim at: (i) Fostering the attitudes of tolerance, respect and solidarity inherent in human rights; (ii) Providing knowledge about human rights, in both their national and international dimensions, and the institutions established for their implementation; (iii) Developing the individual's awareness of the ways and means by which human rights can be translated into social and political reality and at both the national and the international levels.

The definition has evolved since 1978, as noted above. Yet, both definitions share the common emphasis on fostering respect, sharing knowledge about human rights, and raising awareness about strategies to promote human rights from both an interpersonal and legal perspective.

Legal and normative dimensions of human rights

The goals of HRE are oriented around the elimination of human rights violations. Consistent with this higher aim, HRE can be oriented towards changes in the public domain (the behavior of governments) but also changes in the private domain (the behavior of individuals).

In achieving these goals, HRE has both normative and legal dimensions. The legal dimension incorporates sharing content about international human rights standards as embodied in the UDHR and other human rights treaties and covenants to which countries subscribe. These standards encompass civil and political rights, as well as social, economic, and cultural. In recent years, environmental and collective rights have been added to this evolving framework. This law-oriented approach recognizes the importance of monitoring and accountability in ensuring that governments uphold the letter and spirit of human rights obligations. Through the lens of the legal standards, it is governments (signatories to treaties) that are ultimately responsible for preventing such abuses, both through their own behavior but also through their ability to influence the actions of citizens whose conduct may be infringing on the rights of others.

At the same time, HRE is a normative and cultural enterprise. Through the lens of social change, the goals and process of HRE can also be oriented toward the hearts, heads and hands of ordinary people. The process of HRE is intended to be one that provides skills ("hands"), knowledge ("head"), and motivation ("heart") to individuals to transform their own lives and realities so that they are more consistent with human rights norms and values.

Human rights education in school settings is adapted to the age of learners and the conditions of national/local educational policies and schools. Developmental and conceptual frameworks for HRE have been developed by the United Nations, human rights and education scholars, and non-governmental organizations (NGOs). These frameworks assist in setting goals for HRE, illustrating both what it shares and what it adds to other educational approaches that address values such as social justice.

Human rights themes and content in school curricula can take the form of cross-cultural topics mandated by educational policy or it can be integrated within existing subjects, such as history, civics/citizenship education, social studies and humanities. HRE can also be found in arts programs and non-formal clubs and special events occurring in school settings.

In addition to primary and secondary schools, HRE is organized in settings of higher education; in training programs for professionals such as the police, prison officials, the military, and social workers; for potentially vulnerable and minoritized populations; as part of community development programs; and in public awareness campaigns.

Spread of HRE

As part of the expanded human rights movement, HRE has proliferated and differentiated since the 1990s. In fact, the expansion of HRE has benefited from several worldwide developments. These include not only the worldwide human rights movement but also the expansion of mass education and globalization (Ramirez et al., 2006, as quoted in Russell and Suarez, 2017).

What evidence do we have of the proliferation of HRE? Civil society networks serve an important role in disseminating ideas and norms about human rights (Keck and Sikkink, 1998). The only study on this subject indicated that the number of organizations dedicated to HRE quadrupled between 1980 and 1995 (Ramirez et al., 2006). These developments mirrored similar increases in the number of international NGOs during that time.

Human rights discourse has entered into the realms of the nation-state. The establishment of national human rights institutions is one sign of state commitment to human rights. An analysis of national constitutions from 189 countries through 2005, found that 60% mention the term "human rights" at least once (Beck et al., 2012), although we cannot say, of course, if and how the presence of national human rights institutions or human rights in national constitutions reflects actual state behavior or the emphasis on HRE. For some countries, the link is clearly stated. For example, the South African Constitution mandated the creation of the South African Human Rights Commission, which includes education as one of its core responsibilities.

The institutionalization of HRE is also reflected in the proliferation of HRE academic publications and curricula. A 2017 study carried out by Russell & Suarez found “human rights education” in the titles of 474 publications in 2013, as compared with 51 in the year 2000. In the area of curricula, more than 83 countries across different regions of the world have adopted HRE in legislation, policy documents and curricula since the 1990s (Moon, 2009; as quoted in Russell and Suarez, 2017, p. 31). Studies of textbooks have also shown a dramatic increase in the number of times that human rights is mentioned, with increases most pronounced in Africa, Asia and the West, and least pronounced – though still improved – in Eastern Europe and the Middle East (Russell and Suarez, 2017, p.33).

Hundreds of human rights-related teaching materials have been developed worldwide for use in classrooms and schools, and many of these are widely available, free of charge, on the Internet. The On-Line Resource Center of Human Rights Education Associates (HREA), HRE USA, and Novamerica, serve as good examples. As the COVID-19 pandemic of 2020 forced many education courses online, access to HRE in the virtual space, through webinars, workshops, and academic and community courses, increased remarkably that year. Moreover, bibliographies and descriptive databases of HRE materials are available through key human rights organizations as well as United Nations-related agencies (Office of the United Nations High Commissioner for Human Rights 2005; Amnesty International, 2020b; HREA, n.d.; Council of Europe, n.d.).

Impacts of HRE

The literature on HRE has gravitated towards empowerment as a key feature of successful programming. At the same time, empowerment is a multifaceted and nuanced concept that is difficult to define in concrete and observable terms. Empowerment methodologies can be easily linked with skill development. Having the opportunity to develop concrete skills, such as organizational, advocacy or leadership skills, can be considered a form of “instrumental empowerment” (Ross et al., 2011).

Knowledge itself can be a form of empowerment, for example, learning about the law and how to use it to protect one’s rights. Reflecting and recognizing that one’s personal values are consistent with those contained in international human rights standards or that one’s personal experiences of discrimination are shared by others, can also be empowering.

At the University of San Francisco, graduate students, who were also educators, enrolled in an HRE course in which they contributed to research on HRE based on their own teaching experiences. One teacher described how her students responded with feelings of empowerment when she taught HRE in her class. In particular, students whose histories were not reflected in the history textbooks found the means to challenge oppression through HRE (Adamian, 2015). Another teacher shared that her students found hope in human rights. Some of them have gone on to study human rights law and international relations, and be activists for human rights in college (Arduini, 2015). A third teacher found that HRE fosters critical thinking and action. One of her students shared that HRE allowed them to identify rights violations, recognize privilege, and understand their own ability to influence society to promote human rights (Padilla, 2015).

In India, an organization, People’s Watch, has trained teachers in HRE in nearly 4000 schools. Students shared that they were personally transformed by HRE. They used their knowledge to raise awareness about human rights, report abuses, and even to stop human rights abuses themselves (Bajaj, 2011a,b).

These studies provide just a few examples of the impact HRE programs may have on people’s lives. While additional research is needed, it is clear that HRE has the potential to empower people to take action to protect human rights.

Human rights education as an evolving practice

Evolving theories of human rights

Scholars and practitioners have identified principles of good practice for HRE, but there are no ready-made formulas. For each context, for each set of learners, HRE is customized. A term that has come to be used in the field of HRE is vernacularization or localization. It is this adjustment to content and methodologies in programming that allows the message of human rights to be brought closer to people in their daily lives. Bajaj (2011a,b) distinguishes different versions of HRE by ideology, context, constituency and locale. Tibbitts developed the HRE models of Values & Awareness - Socialization, Accountability-Professional Development and Activism-Transformation according to learner groups and strategies for promoting social change (Tibbitts, 2002, 2017).

This flexibility makes HRE a fascinating area of study. It can also create challenges in relation to developing a core literature that applies across contexts. In other words, HRE that is carefully and strategically designed to account for context and environmental specificities means that the results of studies on how learners experience HRE may provide insights locally but often have limited explanatory power elsewhere. For example, in an analysis of HRE content in South African textbooks post-apartheid, it was found that much of the content and exercises emphasized personal and communal values (Russell et al., 2019). The prominence of communal values is not a common theme across all HRE content, although it is becoming more prevalent.

Transformative and emancipatory HRE methodologies

For this reason, interactive, learner-centered methods are widely promoted. The following pedagogical methods are representative of those promoted by HRE advocates. These methods are applicable to all types of HRE but are most comprehensively implemented in popular education learning models.

Justice-oriented: centering marginalized voices, social and economic rights (in addition to civil and political rights), and the analysis of systemic injustice through lenses of critical, antiracist, multicultural, and/or social justice education ([Gibson and Grant, 2017](#));

Decolonizing: centering the contributions of formerly colonized peoples, acknowledging and rectifying the wrongs committed against them, and rejecting the dominance of Eurocentric ways of teaching and learning ([Zembylas, 2018](#))

Experiential and activity-centered: involving the solicitation of learners' prior knowledge and offering activities that draw out learners' experiences and knowledge;

Problem-posing: challenging the learners' prior knowledge;

Participative: encouraging collective efforts in clarifying concepts, analyzing themes and doing the activities;

Dialectical: requiring learners to compare their knowledge with those from other sources;

Analytical: asking learners to think about why some conditions are unjust and how they came to be so;

Healing: promoting human rights in intra-personal and inter-personal relations;

Strategic thinking-oriented: directing learners to set their own goals and to think of strategic ways of achieving them; and

Goal and action-oriented: allowing learners to plan and organize actions in relation to their goals. ([ARRC, 2003](#))

Transformative methodologies encompass and extend methodologies of instrumental empowerment. Both sets of methodologies are intended to cultivate agency in the learner. However transformative methodologies are different in two respects. The first is that the agency of the learner is cultivated with the explicit aim of social transformation through human rights activism. HRE that prepares learners to organize human rights awareness-raising or campaigning can be associated with transformative methodologies, though this can still be considered a form of instrumental empowerment.

The second way in which transformative methodologies are different than empowerment methodologies is that they can also explicitly foster personal transformation, aligned with the concept of "intrinsic empowerment" ([Ross et al., 2011](#)). Transformative and emancipatory learning approaches, drawing from critical pedagogy, invite a critical reflection on power and oppression in one's local environment, usually as part of a close community of learners. Any subsequent reshaping of one's understanding of the world can result in taking actions to combat one's own oppression in one's family and immediate environment, consistent with wider processes of (privately experienced) social change in a society. When organized on a widespread basis with and for persons belonging to oppressed groups, such personal transformations are the basis of human rights activism.

The specific methodologies of transformative and emancipatory learning are associated with critical pedagogy and [Paulo Freire \(1968\)](#). The HRE literature is strongly rooted in critical pedagogy, which encourages learners to think critically on their situation, recognize connections between their individual problems and the social contexts in which they live and to take action against oppression. Critical pedagogy was and continues to be associated with the HRE Transformation Model ([Bajaj, 2011a,b](#); [Tibbitts, 2002, 2017](#)), as this model is explicitly oriented toward a form of empowerment related to overcoming internalized oppression.

Critical pedagogies offer a means to address human rights violations due to systemic discrimination, that is, discrimination that is enmeshed in the systems and values of society. Anti-racist education is an example of a critical and justice-oriented pedagogy that can support learners and educators in disrupting racism at the individual, societal, and global levels. It provides them with the tools to examine racism on multiple levels, including their own position in perpetuating or dismantling it ([Gibson and Grant, 2017](#); [Love, 2019](#)).

HRE in the era of Black Lives Matter and the Covid-19 pandemic

Current events have human rights dimensions and the application of the human rights lens allows for conversations about structural violence and injustices, especially those affecting vulnerable groups. The Black Lives Matter Movement is a human rights movement that calls for racial justice. The movement is not only calling for the end to discrimination against individuals, but a dismantling of the structures in society that perpetuate discrimination. To address injustices fully, HRE must teach about both forms of discrimination as well, and strategies to advocate for change. Teaching about current events such as Black Lives Matter can help learners to understand the need for this dual approach to human rights advocacy.

The global health crisis of Covid-19 has revealed underlying inequalities – both within and across countries – that are affecting people's access to health care including the Covid-19 vaccine, quality education and even food and water. At the time this chapter was being written, new HRE curriculum was under development to support teachers in introducing human rights themes related to the pandemic, foster the sharing of student experiences during the pandemic, and promote taking action to address injustices revealed in the local community and on the global level ([Generation Human Rights and HREA, 2020](#)).

Critiques of human rights and HRE

Universalism

Human rights education (HRE) is one approach in secular education that has had to grapple with the concept of universal values. A traditional HRE approach promotes the universal values of the United Nations and the position that human rights are "universal, interrelated, indivisible and interdependent" ([UN, 1993](#); [OHCHR, 2022](#)). Numerous HRE resources are explicitly oriented toward the transmission of human rights values and standards. The intention is that the human rights framework will be used as a lens for

analyzing human and government behavior and as a basis for improving the realization of human rights in the everyday lives of people.

Hegemonic, western-centered and “top down”

Human rights education needs to be taught in a way that allows for questioning and dialogue. Some HRE scholars have critiqued a “declarationist” approach to HRE as promoting the values embodied in international human rights standards as absolutist, negating the possibility of genuine “dialogue” with learners in regard to their existing value systems (Keet, 2012). At best, such an HRE approach fails to fully foster the critical capacities of learners; at worst, it promotes a hegemonic, Western-centered values system. For HRE to truly be empowering and transformational, it should not be taught in a way that replicates the very rights abuses it aims to dismantle. For that reason alone, HRE necessitates the inclusion of dialogue, deliberation, and debate.

HRE lessons and curriculum aligned with the traditional, or declarationist, approach draw on some of the techniques associated with the psychological theory of intuitive ethics as well as the values clarification approach, a pedagogy that provides learners with opportunities to explore and develop their own value system (Lee, 2001, p. 33). At their core, such values clarification activities presume that the learners will already possess values that are consistent with human rights standards and respect for human dignity. From this perspective, we can see that HRE indirectly endorses the proposal that there are “common values” that operate cross-culturally. In practice, these kinds of HRE activities are also able to bring out some complexity, such as the potential tension between multiple human rights (for instance, freedom of expression in a situation where hate speech is being used).

Some scholars have identified HRE teaching and learning processes that do not allow for a genuine critique of the human rights system as a whole and have therefore promoted political correctness (Baxi, 2009; Keet, 2014). One may use even values-clarification techniques instrumentally for validating the preordained universal values of human rights. Such concerns build on those presented by relativists that the human rights framework reflects an overly dominant Western influence in relation to the ideas of the Enlightenment and the historical context of the immediate post-WWII period. Critics of a traditional “transmission” approach to HRE argue that it does not allow learners to consider these concerns and is therefore contributing to a non-reflective socialization process. These concerns are also amplified in environments where there is sensitivity to the term “human rights” for reasons related to local political dynamics.

Possible solutions for human rights critiques

Educators, scholars, and practitioners have proposed solutions to these critiques that are primarily pedagogical. Some now promote the critical pedagogy approach – established by Paulo Freire and foundational to the popular education version of HRE – for analyzing the human rights framework as a whole, not only the structures in which learners live and work. This approach can explicitly reveal and examine the Western origins and potential hegemonic influences of the human rights system, while in a learning context dedicated to applying teaching and learning systems to promote and protect human dignity. The focus then becomes not whether the human rights framework is the preferable value system to apply, but “what is to be done” to bring about change – using the value system and language indigenous to and embraced by the learner (and presumably consistent with humanistic values).

The literature calls this approach “critical HRE” (CHRE) in order to emphasize that the critique extends internally to the human rights system itself, as well as to society (Keet, 2015; Bajaj 2011a,b). A more recent development is the use of the term “transformative HRE” (THRED) (Bajaj et al., 2016), emphasizing the role of pedagogy in promoting social change and consistent with the transformative model of HRE (Tibbitts, 2002, 2017). Some scholar-practitioners have moved away from use of the term “HRE” altogether and instead promote the concept of “humanizing pedagogy” or the “pedagogy of mutual vulnerabilities” (Salazar, 2013; Keet et al., 2009). Some view such approaches as helping to ensure the emancipatory and liberating potential of HRE.

Another pedagogical response actively seeks to bridge local and transnational vernacular rights cultures. Critical interpretive pedagogy proposes more specifically that human rights must be interpreted within a plurality of cultural, religious and philosophical doctrines (Adami, 2014; Al-Duraweesh and Snauwaert, 2013). Rather than simply applying a universal set of abstract principles, rights are actively interpreted, shaped and transformed. They are thus “sutured with the multiple histories, cultures and contexts in which they are formed, and reflect a history of struggles that is both local and transnational” (Dunford and Madhok, 2015). This quasi-universalistic approach is a practical accommodation to the criticisms of universal values.

In complement with these pedagogical methods, the decolonization of HRE may ensure that HRE does not perpetuate the very oppression it seeks to undo. Decolonizing HRE means to not favor Eurocentric epistemologies to the detriment of others, particularly those from the Global South. Decolonization could include the acknowledgment and attribution of contributions to the human rights framework by non-Western countries and individuals and to share content and knowledge from non-Western scholars, practitioners, and activists. It goes beyond the classroom content, though, to include who is teaching, how they teach, and the environment in which they teach.

The HRE models and pedagogies inform teaching and learning at the practical level. HRE is implemented in a wide range of settings and contexts with diverse groups of learners. To be effective, educators must adapt their pedagogical approaches and educational content based on these variations. In the next sections, we share examples of this variety of approaches and content of HRE in action.

HRE in action

HRE is offered in formal settings such as primary, secondary, and higher education and as part of professional development. It is offered non-formally by NGOs and after-school clubs. It is even present in informal settings such as in community conversations, as public art, and around the dinner table. The online space, in part spurred on by the COVID-19 pandemic, is now flooded with HRE courses, workshops, lessons, and other resources.

HRE in National Plans of Action (Mexico)

In national curricula, HRE is included at different levels. At least 20 countries have created National Plans of Action for Human Rights Education ([Office of the United Nations High Commissioner for Human Rights, 2020a,b](#)). Another 36 countries address HRE in their National Plans of Actions for Human Rights. The inclusion of HRE in a national level plan is one sign of a country's commitment to the right to HRE. Mexico offers one example of this. The first country to include economic and social rights in its constitution in 1917 ([Sikkink, 2019](#)), today in Mexico, HRE is offered through NGOs as well as local and national commissions for human rights in order to work towards ending current and preventing future human rights violations ([Martinez Sanz, 2018](#)). Between 2013 and 2015, the National Human Rights Commission reported that public organizations had carried out at least 20,000 HRE related activities in the country. This number does not include non-profit organizations and other private sector activities ([Martinez Sanz, 2018](#)).

Even countries that do not have plans at the national level may still include HRE in their formal and non-formal educational institutions. For example, in the United States, where education is decentralized, at least 42 of the 50 states have required or recommended HRE standards in their social studies curricula ([Sirota, 2017](#)). Through these diverse and varied offerings, HRE reaches individuals and communities around the world, as described in the following examples.

HRE in the K-12 schooling sector (South Africa, USA)

In South Africa, HRE can be found in the secondary school textbooks for the subjects of social studies, history, and life orientation. In social studies and history, the HRE content is integrated into other material, such as World War II. In life orientation, human rights is offered as its own topic, though requiring only 7 h of instruction in 10th and 11th grades, and 4 h in 12th grade. In the history and social studies textbooks, HRE focuses on knowledge and values. In contrast, the life orientation textbooks include lessons to ensure learners not only know their rights and critically consider their values, but also how to advocate for human rights ([Russell et al., 2019](#)). At present, a plan is underway to include HRE in a new national teacher training program, Teaching for All, in South Africa. ([British Council, 2020](#)).

In the United States, as education is decentralized, each state sets its own curriculum standards. While HRE is in social studies curriculum standards in at least 42 states, only two states include HRE at every grade level – New Jersey and Mississippi ([The Advocates for Human Rights, 2016](#)). Where national and state mandates are lacking, local school districts may choose to include HRE more robustly than required. In Manchester, Connecticut, for example, HRE is now a required high school course in order for students to graduate ([Faipier, 2018](#)). Some schools that do not offer standalone human rights classes invest in human rights by supporting teachers' professional development through HRE organizations such as RFK Human Rights. Through the organization's program, Speak Truth to Power, RFK Human Rights has trained over 9000 educators around the world ([RFK Human Rights, 2020](#)).

HRE in higher education

Human rights centers (global, USA)

At the higher education level, as in many other areas of education, HRE has a growing presence. Human rights and HRE degrees are offered at the bachelors, masters, and doctoral levels. Universities and colleges also offer human rights as an undergraduate double major or a minor. They offer human rights concentrations or a certificate. At even more universities and colleges, at a minimum, students can enroll in individual human rights courses. In addition to degrees and courses, in recent years two special issues on HRE were published in the journals *Prospects* and the *Journal of Human Rights*. Two new journals dedicated to HRE were created – the *International Journal of Human Rights Education*, out of the University of San Francisco and the *Human Rights Education Review*, out of the University of South-Eastern Norway.

College and university human rights centers are often integral to the promotion of HRE on campus, and in the surrounding communities. In addition to overseeing and coordinating majors, minors, concentrations, and certificates, they provide offerings to the broader community within and around the institution through public events, workshops and classes. In recent years, human rights educators and center directors have established networks to support each other's work and further develop the field of HRE. In the United States, the University and College Consortium for Human Rights Education (UCCHRE) was founded in 2016. The mission of the consortium is "to further human rights learning, research, policy, and practice within and across university and college communities." UCCHRE's effort is another example of the growing cooperation in and professionalization of the field.

Practical human rights courses in higher education offer the opportunity for students to contribute to advocating for human rights by working on specific issues and learning from community members. These opportunities may be offered by professors in partnership with civil society organizations. Professor Bill Simmons teaches a course at the University of Arizona known as Problem-based Learning without Borders (PBL). He emphasizes the course's versatility: it can be taught at the undergraduate or graduate level, online and offline, with any group of students and in large and small classes. Course meetings may even be held at

a community-based setting. Students research local or global issues, working with and learning from the community-based group. Past courses have focused on human rights topics such as mass incarceration in Arizona, femicide in Mexico, and women's rights in South Sudan. The students conduct research, offer strategies to achieve the community's goals, and work with community partners to strengthen and implement those strategies. Professor Simmons' students have directly contributed to efforts to secure human rights, such as when their work was used in a legal case on femicide in Mexico which was brought in front of the Inter-American Court of Human Rights (Simmons, 2020).

Scholars at risk Student Advocacy Seminars (global, USA)

Opportunities for gaining practical skills and experiences, and contributing to the field of human rights may be initiated by NGOs in partnership with institutions of higher education. The organization Scholars at Risk (SAR) offers an example of this. SAR is an NGO that since 2000 has worked with colleges and universities around the world to host scholars whose academic freedom is in jeopardy in their home countries. In 2014, SAR launched Student Advocacy Seminars. Through these seminars which are run around the world, students spend a semester conducting research and advocating to secure the freedom of a scholar who has been wrongfully imprisoned, in violation of their human rights, often due to advocating for democracy. Students gain knowledge and skills in promoting human rights as they simultaneously apply theory to practice in advocating for the freedom of an imprisoned scholar (Scholars at Risk Network, 2020).

Universities and colleges can be resources for the general public to access HRE. The University of Arizona, University of Connecticut, Columbia University, the University of Graz (Austria), Université catholique de Louvain (Belgium) and Leiden University (The Netherlands), among others, offer human rights courses and workshops that are open to the public on current issues such as systemic racism, migrant and refugee rights and the COVID-19 pandemic, and on skills-building such as conducting research or teaching human rights.

HRE in teacher training (USA)

As demonstrated, HRE is included in regional, national, and local curriculum in primary, secondary, and higher education. Teachers receive training in HRE through multiple avenues. Teacher education in human rights may take place in universities and colleges, through non-profit organizations, at the level of the national government, or in professional development programs in K-12 schools.

Teacher education in human rights is a fairly small field at present, though in a number of places, it is readily available and robust. In the northeastern US, the University of Connecticut offers HRE to pre-service teachers and current high school teachers. For example, teachers may become certified as Early College Experience, or ECE teachers, thereby being able to teach human rights to students in their high school, who receive college credit for these classes. After their initial coursework, in order to maintain ECE certification, teachers must participate in HRE workshops at least once every two years. The number of teachers who have become ECE certified is growing. As of 2020, 25 teachers across the state were certified, with six more teachers in the midst of the certification process (Glenn Mitoma, personal communication, August 7, 2020).

HRE in the training of social workers and psychologists (Netherlands, USA, Europe)

At the heart of the UDHR is the "equal unalienable worth of a human being". The fields of both social work and psychology are essentially about the problems of human beings and human relationships. In the field of psychology, the person, couple or family unit is the unit of change whereas in social work the community and society (in addition to the person and family) can be the focus area.

In recent years, practitioners and trainers in these fields have begun to integrate an explicit human rights dimension into their work. Human rights is linked with the core dignity of each client and potentially offers a universal framework of ethics that is rooted in international law. The human rights value system is in line with the "capabilities approach" argued by Sen (1999), who sees capabilities as essential for freedom to being human, to develop and for the realization of human rights. Moreover, the human rights approach for social work explicitly recognizes community organizing as a form of community social work (Staples, 2012) that "connects people on the basis of a sense of common experiences, such as exclusion, poverty or other forms of social injustices" (Rayneart et al., 2010, p. 7).

In the social work sector, the International Federation of Social Workers has endorsed human rights as a core competency. The working group of social work trainers in the Netherlands and Flanders developed a manifesto in 2015 calling for the inclusion of HRE within the training of social workers (Raynaert et al., 2010). As of 2015, the Council on Social Work Education has as its Competency 3: Advance Human Rights and Social, Economic and Environmental Justice as a required goal for schools of social work in order to be accredited (Council on Social Work Education, 2015, p.7). This competency creates an incentive for more schools of social work to integrate these principles within their education programs. The National Association of Social Workers (2006) in the US also has a Policy on Human Rights.

Scholarship related to human rights and social work is growing, including the launch of the *Journal of Human Rights and Social Work*. This scholarship includes studies related to the application of human rights to social work policies and practices.

The Institute for Social Work at the Utrecht University of Applied Sciences (Netherlands) provides an example of the infusion of HRE. The first year of social work education curriculum now integrates human rights themes repeatedly within the program, Principles of Social Work. This approach cements several theme-centered programs where HRE is delivered in a more reflective and experiential way. The recently developed second-year bachelor pursues the same didactic structure of first year Social Work. The second

year comprises four theme-centered programs (1) social security and safety, (2) social (in)justice (community level), (3) participation, and (4) empowerment (individual level) (Reynaert et al., 2010, p. 3).

Over the years, both international and national psychology associations have endorsed the application of ethics and, specifically, human rights norms in the professional practices of researchers, practitioners and educators within psychology. This includes the following: The International Association of Applied Psychology (IAAP), the International Association for Cross-cultural Psychology (IACCP), and the International Union of Psychological Science (IUPsyS) developed and endorsed The Universal Declaration of Ethical Principles for Psychologists (UDEPP) (2008). The European Federation of Psychologists' Associations (EFPA) established a Board of Human Rights and Psychology in 2013. In addition, there are numerous national associations, like the American Psychological Association (APA), which have issued statements and principles related to human rights, psychologists and codes of conduct.

Thematic areas where HRE might be integrated within psychology education include, but are not limited to:

- International and regional human rights standards related to psychology (e.g., the UDHR and the rights of vulnerable groups)
- History of psychology/psychologists and human rights (e.g., psychological approaches to intergroup contacts, social inclusion, conflict and discrimination)
- Human rights as part of ethics/codes of conduct training
- Advocacy and root cause analysis within practicums (e.g., addressing political, social and economic conditions violating human rights and contributing to human suffering)
- Foundation of psychology – Feminist, cross-cultural and decolonial perspectives (Tibbitts and Hagenaars, 2020, pp. 254–259).

The Global Network of Psychologists for Human Rights (GNPHR) (<http://humanrightspscychology.org/>) was launched in 2020, and the website is hosted by the International Council of Psychologists (ICP, Inc). The website contains an evolving resource section to support the integration of human rights within psychology education and training. In this fast-developing area of HRE work, two publications came out in 2020 (P. Hagenaars et al., 2020; Rubin and Flores, 2020) and more are anticipated (Global Network of Psychologists for Human Rights, 2020).

HRE in the non-formal education sector

Amnesty International (global)

Amnesty International is the largest membership-based human rights organization in the world with over 2 million members and 5 million supporters (Amnesty International website). Amnesty's primary focus is research and campaigning to influence governments to abide by human rights obligations. Founded in 1961 in the United Kingdom initially to campaign for the release of political prisoners, the organization began to integrate HRE within its activities in the mid-1990s (Amnesty International, 2020a).

One key program is the "Write for Rights" (W4R) campaign, which takes place annually around Human Rights Day on December 10th. Human Rights Day commemorates the day when the Universal Declaration of Human Rights was adopted in 1948, shortly after the founding of the United Nations. Amnesty encourages people to show their solidarity with the international human rights movement by engaging in the W4R campaign.

A major part of the W4R campaign consists of a letter-writing marathon which involves millions of people around the globe. In 2017, more than 6 million actions were taken in support of the individuals and groups featuring in the campaign (Amnesty International, 2018, p. 3). Every year, supporters write two letters. "One is to the person in authority – it could be a king/queen, president or head of police – who can help make change happen. The other letter is to the person or group of people we are fighting for (and/or their family) to express support so they know we will never forget them" (Amnesty International, 2018, p. 5).

For example, one of the human rights defenders that Amnesty included in their 2018 campaign was Atena Daemi from Iran, who was serving a seven-year prison sentence in Tehran's Evin prison. She had suffered inhumane conditions and been denied medical treatment as retaliation for defending human rights, in particular for speaking out against the death penalty (Amnesty International, 2018, p. 13).

Another key HRE program carried out by Amnesty International is "Human Rights Friendly Schools", which began in 2009 and involves 16 countries. Amnesty staff and volunteers work with whole schools that "places human rights at the heart of the learning experience and makes human rights an integral part of everyday school life" (Amnesty International, n.d.). Beginning with a problem-seeking analysis of school conditions using a human rights lens, projects are undertaken to improve the realization of the principles of equality, dignity, respect, non-discrimination and participation. All aspects of school life are eligible for improvement: decision making in the school, discipline policies, relationships, curriculum, extra-curricular activities and the school's physical environment. Amnesty's Human Rights Friendly Schools program has a toolkit and builds on the literature of the whole school approach and whole school development.

A recently developed HRE area for Amnesty is its *Human Rights Academy*, an online platform for human rights learning. The initiative was spearheaded by the Amnesty team in the Middle East and North Africa in the wake of the Arab Spring, in order to support human rights defenders in the region and elsewhere. The multi-lingual learning platform includes self-paced online learning (for example, on different human rights areas, such as the rights of refugees), advanced capacity building on documenting human rights violations as well as online tools to facilitate youth activism (Amnesty International, 2020b).

Women for Women's Human Rights (Turkey)

The majority of HRE efforts carried out in the non-formal education sector are through local or national organizations. One organization with a long record of carrying out HRE is Women for Women's Human Rights (WWHR)- New Ways, which operates in Turkey. WWHR – New Ways is a non-governmental organization (NGO) that organized a legal literacy program for adult women through a 14-year partnership with the Turkish General Directorate of Social Services (GDSS). WWHR prepared GDSS staff to deliver a 16-week Human Rights Education Program (HREP) for women who come to local community centers to receive services. Based on both a legal rights and gender perspective, the 16-week program seeks to empower women to know and claim their rights both in the private sphere (including familial relations, sexual and reproductive rights, gender sensitive parenting) and the public sphere (including economic rights, political rights, organizing, and access to justice).

According to WWHR literature, the specific objectives of HREP are:

- Enable women to gain awareness of their rights as equal citizens;
- Raise women's consciousness of how customary practices, that is, 'unwritten' laws, often limit or violate their rights;
- Serve as a catalyst for women's organizing efforts on the local and national levels and support grassroots organizing initiatives;
- Support women in developing strategies for the implementation of their legal rights in daily life (Tibbitts, 2016, pp. 2–3).

As of fall 2013, nearly 9300 women had participated in the program. The results of an impact assessment study in 2012 demonstrated impacts both on the learners and facilitators. Areas of impact included their identity; knowledge, skills, and attitudes; and behaviors in their family and in the workplace. These results are demonstrated not only in the private domain, but in the women's professional roles (Tibbitts, 2016, pp. 16–17).

HRE in community development

Tostan (Senegal)

HRE programs can be embedded within community development programs and linked with skills related to self-reliance. A community-based approach to HRE can involve processes such as mapping power and leadership in a community, holding discussions about the needs of members, and deciding collaboratively which ones to prioritize. In the absence of effective state services, community members address their own problems, which may or may not involve resorting to changing formal or customary laws but will almost certainly involve human rights values. In the non-formal HRE program in Senegal, the NGO Tostan integrates HRE within their Community Empowerment Program (Cislighi et al., 2016).

Tostan is a three-year, education program that puts rural communities in charge of their own futures. The Community Empowerment Program (CEP) involves human rights-based education classes and the establishment of a Community Management Committee (CMC).

Each village runs two classes of 25–30 participants – one for adults and one for adolescents – that meet three times per week over the course of the program. These are facilitated by someone from the same ethnic group but a different village, thus someone fluent in the local language and familiar with local customs. The classes draw on “modern nonformal education techniques as well as traditional African oral traditions like theater, storytelling, dance, artwork, song, and debate” (Tostan, 2020).

In addition to the CEP classes, communities establish a CMC that is responsible for implementing development projects designed by the community. Trained by Tostan, these are democratically-selected 17-member committees, of which nine members are women (Tostan, 2020).

Human Rights Cities (global)

The global Human Rights Cities movement similarly focuses on change at the city, town and village levels. A Human Rights City may be defined as a municipality that has adopted human rights principles and laws as guiding norms of governance. In practice, it provides for an “inclusive civic engagement with city management, where people have the power to decide on policy proposals and politicians assume the role of policy implementers, hence fostering participatory democracy with solidarity and social justice. Such a commitment translates locally into an improvement in the quality of life of all residents” (Human Rights Cities, 2020).

There are human rights cities in every major global region, which are also networked. Examples include Korogocho (Kenya), Nuremberg (Germany), Porto-Alegre (Brazil), Rosario (Argentina), and Walewale (Ghana). In the cases of these cities, each process has been tailor-made, is context specific and based on individual commitments. Different degrees of commitment and responsibility exist among human rights cities, which may vary from the declaration of intention to the effective implementation of a process where residents' civil, political, economic, social and cultural rights are at the center of the city's governance and public policies (Human Rights Cities, 2020).

Human rights cities initiatives involve some degree of public awareness raising for HRE. A human rights city initiative that is formalized can involve a commitment to the Universal Declaration of Human Rights as a norm of governance, combined with other human rights conventions such as the Convention on the Rights of the Child (1989) or the Convention on the Elimination of All Forms of Racial Discrimination (1969). Key is “the establishment of a socio-political process where the community and the municipality (usually represented by a governing body) cooperate to integrate the fundamental values as a priority in the planning and governance of the city” (Human Rights Cities, 2020).

Within the community development framework, HRE fosters the changed behavior of both state- and non-state actors, that is, everyday people in their daily lives. The norms for such changed behavior can be fed through the cross-cutting (human rights)

values of non-discrimination, equality, inclusion and participation, as well as the norms associated with the human rights of specific marginalized groups.

Concluding thoughts

The Universal Declaration of Human Rights was created in 1948. Despite the fact that it has been translated into more languages than any other document in the world, over 70 years later, people around the globe still lack access to human rights education. Yet, as demonstrated, promising HRE initiatives can be found flourishing in schools, communities, and professional spaces, empowering both learners and educators. In order for it to continue to flourish, just as the UDHR has been reinterpreted over time to now include such rights as the internet and same sex marriage, human rights educators must continue to reflect on and critique HRE to ensure it adapts with the times.

Introduction

In this chapter we explore the relationship between education and development and how this has been considered in research and policy. We discuss key issues regarding how this relationship has been understood, conceptualized and monitored. In doing so, we pay particular attention to debates regarding gender equality and girls' education, and how these have been positioned in relation to a wider development agenda within global policy frameworks (such as the United Nation's (UN) Millennium Development Goals and subsequent Sustainable Development Goals), and in the work of international development organizations.

The chapter is organized as follows: first, we provide a brief overview of some of the key debates regarding the relationship between education and international development, and their position within global policy. We then turn our attention to key issues in relation to concerns with equality, inequalities and girls schooling, and look at approaches to measuring and monitoring these. Finally, we consider the implications of the current global context, and multiple, intersecting forms of crisis, for efforts to promote equitable education for all, in the context of wider global aspirations for sustainable development.

Framing education and international development

The 2030 Agenda for Sustainable for Development, which was adopted by all UN member states at the UN Summit for Sustainable Development in New York in September 2015, sets out a global vision for achieving "sustainable development in its three dimensions—economic, social and environmental" (UN, 2016), and identifies 17 Sustainable Development Goals (SDGs), which are seen as key to realizing this. Education holds a central place within the 2030 Agenda. It appears both as a goal in its own right—Goal 4 sets out 7 targets to "ensure inclusive and equitable quality education and promote lifelong learning opportunities for all" (see Fig. 1)—and as a key component of the targets of many of the other goals. Education is thus positioned both as an end and a means to development, and viewed as critical for achieving a wider vision of "ending poverty and hunger", "protecting the planet from degradation", ensuring "that all human beings can enjoy prosperous and fulfilling lives" and fostering "peaceful, just and inclusive societies" (UN, 2016).

The 2030 Agenda does not represent the first time that education has been positioned in this way within global policy on development. In the year 2000, when leaders from around the world came together in New York under the umbrella of the UN to agree the Millennium Development Goals (MDGs), which, as the predecessors to the SDGs, set out a series of goals and targets to be reached by the year 2015, education was similarly central, appearing both as an individual goal—Goal 2, to achieve universal primary education—and as a key target for Goal 3 on gender equality. Moreover, as noted by Unterhalter and North (2017, p. 2), "schooling and strategies to engage with poverty had featured prominently in post-colonial policy discussions around the world since the end of World War 2". However, while policy frameworks such as the SDGs and MDGs appear to reflect a growing consensus regarding the centrality of education within a wider global development agenda, how both education and development have been defined, and how the relationship between them is understood, is often highly debated and subject to multiple contestations and interpretations.

Development, as a term, is particularly contested. McCowan and Unterhalter (2022, p. 5) note that the emergence of the term "development" is sometimes associated with "the process of change of the less wealthy and often newly independent countries of Africa, Asia and Latin America, in conjunction with an increasingly elaborate architecture of development agencies", which arose in the period following World War 2. However, while conceptualizations of development, linked to ideas about "progress" and processes of industrialization and economic growth in lower-income countries in the global South, remain dominant in mainstream development literature, these have been challenged by a number of different groups and perspectives. Post-development,

The Sustainable Development Goals
Goal 1: End poverty in all its forms everywhere
Goal 2: End hunger, achieve food security and improved nutrition and promote sustainable agriculture
Goal 3: Ensure healthy lives and promote well-being for all at all ages
Goal 4: Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all
Goal 5: Achieve gender equality and empower all women and girls
Goal 6: Ensure availability and sustainable management of water and sanitation for all
Goal 7: Ensure access to affordable, reliable, sustainable and modern energy for all
Goal 8: Promote sustained, inclusive and sustainable economic growth, full and productive employment and decent work for all
Goal 9: Build resilient infrastructure, promote inclusive and sustainable industrialization and foster innovation
Goal 10: Reduce inequality within and among countries
Goal 11: Make cities and human settlements inclusive, safe, resilient and sustainable
Goal 12: Ensure sustainable consumption and production patterns
Goal 13: Take urgent action to combat climate change and its impacts
Goal 14: Conserve and sustainably use the oceans, seas and marine resources for sustainable development
Goal 15: Protect, restore and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, and halt and reverse land degradation and halt biodiversity loss
Goal 16: Promote peaceful and inclusive societies for sustainable development, provide access to justice for all and build effective, accountable and inclusive institutions at all levels
Goal 17: Strengthen the means of implementation and revitalize the global partnership for sustainable development

Fig. 1 The 17 Sustainable Development Goals (SDGs).

post-colonial, and decolonial scholars (e.g., Escobar, 2011; Sachs, 1997; Kapoor, 2008), for example, have argued for the need to understand development as a “eurocentric and hierarchic construct defining non-Western, non-modern, non-industrialized ways of life as inferior” (Ziai, 2017, p. 2547), and emphasized its role in the maintenance of colonial hierarchies and relationships (McCowan and Unterhalter, 2022). Meanwhile, although ideas regarding rights, equity and capabilities, as advanced in the work of scholars such as Amartya Sen (1999), have, since the 1990s, increasingly formed part of official development discourse, such normative concerns often sit uneasily alongside models and measures of development based on GDP and economic growth within the work of international agencies and other development actors (Chase and North, 2022). Education, too, can be interpreted in a range of different ways. While the term is often associated with the formal schooling of children (reflected in the focus on universal primary education in the MDG framework), a more expansive understanding of education also includes attention to learning that takes place in a wide range of formal, non-formal and informal settings (reflected in the emphasis in SDG 4 on *lifelong learning opportunities for all*), and which encompasses a range of different forms of knowledge, including non-western and indigenous knowledges (Chase and North, 2022).

These very different conceptualizations of what development and education are and mean have significant implications for understanding the relationship between education and development and how this has been conceptualized. Unterhalter (2022, p. 20), in outlining the emergence and evolution of the field of education and international development, identifies two contrasting approaches, which reflect “clear disputes with regard to how development is understood and what approaches to education policy, practice and research are entailed”. The first “mainstream” account of the education and international development field is linked to the emergence of development economics as a distinctive disciplinary area from the 1950s. Unterhalter argues that, in this account, development is understood primarily in terms of economic development, and education—mostly conceived of in terms of formal schooling—“is viewed as an aid to economic growth, which itself is initially linked with enhancing industrialization” (Unterhalter, 2022, p. 20). In this view, education is linked to supporting the “needs of the economy through building human capital and enhancing market relations” (Unterhalter, 2022, p. 22) and, more recently, “with enhancing relations of good governance, building institutions, and sometimes with addressing poverty” (Unterhalter, 2022, p. 22). Unterhalter describes such a concern with “making education effective”, which is often associated with the work of international organizations, including those associated with the UN as well as the World Bank and bi-lateral donor agencies, as the “what works” agenda, due to its core focus on “what works” for effective delivery of education and associated development outcomes.

A second, more critical account “draws out how ideas about education and development had been a strand in the expansion of colonial or imperial rule for many centuries” and sees education as a “key location for political, cultural and social contestation” (Unterhalter, 2022, p. 21). Education and international development as a field is thus linked with “many areas of subaltern and dominant knowledge, contested claims to authority, to land, to struggles over rights” (Unterhalter, 2022, p. 22). Here, education

is not simply understood in terms of the effective or efficient delivery of schooling but is a “contested terrain in which different values ... [and] stories of pain, dispossession, inequality and the effects of violence are articulated” (Unterhalter, 2022, p. 22). In this more critical view, the relationship between education and development is therefore a complex one, with attention paid to how different educational spaces and systems may play a role in reproducing or contributing to the transformation of different forms of inequalities and exclusion. Unterhalter refers to this understanding of education and international development as being associated with a “what matters” agenda, linked to concerns with supporting human rights, decolonial struggles, sustainability, and the promotion of gender and other forms of equality.

When, as 2015 approached, the global community reviewed progress in relation to the MDG goals and targets, it became apparent that, despite important gains in terms of expanding access to primary schooling around the world, and improvements in terms of the numbers of boys and girls enrolled in schooling, wider inequalities within and beyond education persisted. It was clear that the strategy of simply getting children into schools on its own was not enough to transform the wider dynamics of inequality and poverty, and the relationships that produce them, in order to deliver “development”. Rather, there was, it appeared, a need to move beyond a focus on “quick wins” (and “what works”) in terms of getting children into school, and to instead pay closer attention to work across sectors, to understanding context and the social and political relationships and dynamics of power in which educational systems and actors are located, and to engaging with the content of teaching and learning and the reproduction of inequalities within the education system itself. To some extent, this is reflected in the more expansive goals and targets associated with the 2030 Agenda, which pay attention to different spaces and levels of education, and place particular emphasis on issues of quality. SDG 4 (see Fig. 2) speaks to the need to consider different forms of inequality, and for educational spaces to be safe and inclusive. It also highlights issues of content, indicating that all learners should “acquire the knowledge and skills needed to promote sustainable development”. However, what this means in practice and how the aspirations set out in the

SDG 4: Ensure inclusive and quality education for all and promote lifelong learning:

Targets:

1. By 2030, ensure that all girls and boys complete free, equitable and quality primary and secondary education leading to relevant and effective learning outcomes
2. By 2030, ensure that all girls and boys have access to quality early childhood development, care and preprimary education so that they are ready for primary education
3. By 2030, ensure equal access for all women and men to affordable and quality technical, vocational and tertiary education, including university
4. By 2030, substantially increase the number of youth and adults who have relevant skills, including technical and vocational skills, for employment, decent jobs and entrepreneurship
5. By 2030, eliminate gender disparities in education and ensure equal access to all levels of education and vocational training for the vulnerable, including persons with disabilities, indigenous peoples and children in vulnerable situations
6. By 2030, ensure that all youth and a substantial proportion of adults, both men and women, achieve literacy and numeracy
7. By 2030, ensure that all learners acquire the knowledge and skills needed to promote sustainable development, including, among others, through education for sustainable development and sustainable lifestyles, human rights, gender equality, promotion of a culture of peace and non-violence, global citizenship and appreciation of cultural diversity and of culture's contribution to sustainable development

Means of implementation:

- a. Build and upgrade education facilities that are child, disability and gender sensitive and provide safe, non-violent, inclusive and effective learning environments for all
- b. By 2020, substantially expand globally the number of scholarships available to developing countries
- c. By 2030, substantially increase the supply of qualified teachers, including through international cooperation for teacher training in developing countries, especially least developed countries and small island developing States

See: <https://sdgs.un.org/goals/goal4>

Fig. 2 SDG 4 targets and means of implementation.

SDG targets can and should be implemented and monitored, particularly in complex and resource-poor contexts, remains an area of much debate.

In the next sections we turn our attention to some of these debates about quality, equality, and measurement, and consider, in particular, the focus on girls' education and gender equality, and how these have been positioned in relation to wider discussions regarding education in and for international development.

Quality, inequality and equality in education

Issues of power and powerlessness are embedded within the complexity of the field of education and international development outlined above. And concomitant concerns around "quality", "equality" and "inequality" in relation to education arise in varying, often contrasting and contested, ways from these longstanding and emerging debates about the meaning and nature of "development" and the associated positioning and role of education. Within the "mainstream" account of education and development, quality education has predominantly been conceptualized in instrumental terms, more closely linked with notions of efficiency and effectiveness and a focus on outputs and outcomes within formal schooling (Smith and Benavot, 2022; Wulff, 2020), underpinned by the "what works" agenda. From this perspective, equality in education has largely focused on equality in numbers, particularly in terms of equal access to education and the development (or not) of adequate skills for labor market participation through education (Sayed and Moriarty, 2020).

By contrast, within the second more complex and critical account of development, ideas around what quality education entails are generally more holistic and less linear, incorporating the intrinsic value of education and a focus on inputs, activities and experiences of education. Quality education in this account also connects with a broader understanding of education beyond formal schooling, reflecting the "what matters" agenda. It is thus a more contested notion because different things often matter differently to different people within and across different contexts. Likewise, equality in this account is also a more complex and contested notion, linked with ideas around rights, social justice, inclusivity, identity, gender equality and women's empowerment, and decolonization (UNESCO, 2005; Wulff, 2020; Unterhalter, 2022). Of course, because the distinctions within and between these different accounts of education and international development are not necessarily clear cut or disconnected from one another, understandings of and concerns about quality and equality can also incorporate ideas linked both with "what works" and "what matters" (Unterhalter, 2022, p. 27).

In whichever way education and development is conceptualized, recognizing the multiple and multi-dimensional nature of inequalities in education is important because the different ways in which these inequalities operate have different implications for policy and practice (Stewart, 2002, 2011; Picketty, 2019; Unterhalter and North, 2017). Thus, we can think about inequalities as being horizontal (relating to groups, cultures and associated forms of inclusion and exclusion in education), vertical (relating to distributions of resources, such as how much schooling people receive) or process (relating to learning and teaching interactions or an individual's ability to exercise agency) (Unterhalter et al., 2022a). We can also think about inequalities as being intersectional, whereby inequalities linked with different forms of social structure, division and discrimination, such as class, caste, gender, poverty, ethnicity or disability, can combine or intersect and amplify each other (Crenshaw, 1991). And such insight can be crucial for determining those who are most disadvantaged or marginalized (Kabeer and Santos, 2017). Crossing through these different groupings, we can identify inequalities of opportunities in terms of access to and participation in the various spaces of formal, non-formal and informal education; inequalities in experiences within education, linked with teaching and learning practices, relationships and features of quality; and inequalities of outcomes, whereby, for example, some people attain less well or better than others, or experience discrimination in the labor market. Inequalities can also operate at different but often interconnected levels – at the individual, institutional, community, regional, national or international level, depending, for example, on the efficiencies, capabilities and financing of schools and education systems (Unterhalter, 2022). And while some inequalities are relatively easy to identify (e.g., inequalities in access to formal schooling) and/or may be temporary, other inequalities (e.g., inequalities in people's experiences in education, including their experiences of violence, or their ability to exercise agency) are less straightforward (Parkes et al., 2020b) and/or may be deeply embedded and persistent.

Across all countries, gender inequalities in education are among some of the most persistent as well as the most complex and challenging forms of inequality to identify and address. Not only has this been recognized as a major obstacle for sustainable development and peaceful societies (see SDG 2030 Agenda; UNDP, 2019, p. 147), but it is also a grave matter of social injustice. Gender equality has thus been a driving principle in international development policy and practice for many decades, with girls' education, in particular, often hailed a silver bullet for development, linked to the belief that if you "educate a girl, you educate a nation" (see, for example, the 2021 G7 Declaration on girls' education (UK Government, 2021; UNGEI, 2022).

Within global policy, the Universal Declaration of Human Rights first articulated the right to education, irrespective of sex, in 1948. This was reaffirmed by the UN General Assembly in the 1989 Convention on the Rights of the Child and by the international education community in both the 1990 World Declaration on Education for All and the 2015 Incheon Declaration, which supports the 2030 SDG Agenda. Key global declarations in support of gender equality in development more broadly include the 1979 Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) and the 1995 Beijing Declaration and Platform for Action, agreed in Beijing at the Fourth World Conference on Women, which is still widely considered one of the world's most comprehensive and progressive proposals for advancing women's rights and gender equality (UN Women, 2014).

Nevertheless, despite these significant policy agreements, the achievement of substantive gender equality in and through education remains stubbornly elusive.

The many debates about definitions of gender and intersecting inequalities make the challenges for achieving transformational change in both the education field and the wider international development field even more acute. During the MDG era, the provision of free primary education to support children to attend and stay in school was a major strategy for addressing inequalities in education, including gender inequalities. Gender equality in education, meanwhile, was correspondingly seen as an issue of getting equal numbers of girls as boys in school, with an assumption that a number of beneficial social, health and economic outcomes associated with girls' education would follow (Unterhalter et al., 2022a)—an assumption supported by various quantitative studies which have outlined the beneficial effects of expanding girls' enrollment on a range of development outcomes including economic growth, fertility rates and infant mortality (e.g., Klasen, 2002; Psacharopoulos and Patrinos, 2018). Popular policies aiming to support girls' education have included conditional and unconditional cash transfers, scholarships and stipends, and free school meals (see Kremer et al., 2009; Baird et al., 2011; Baulch, 2011; Unterhalter et al., 2014; Sperling and Winthrop, 2016). Gender equality, in this sense, is narrowed down to the target of gender parity, which measures the numbers of girls/women as a proportion of the number of boys/men in different aspects of education, such as enrollment, attendance, attainment or teacher training, and provides some insight into the allocation and use of educational resources (North and Longlands, 2017). But, as we discuss below, while important, gender parity alone cannot measure the complexity of gender inequalities in and through education and is thus not sufficient to adequately inform strategies for the achievement of more substantive gender equality (Bardhan and Klasen, 1999; Unterhalter, 2015; UNESCO, 2016; Unterhalter et al., 2022a).

By 2015, although 66% of countries had achieved gender parity in primary education, 5 million more primary aged girls than boys were still out of school (UNESCO, 2016). Moreover, the focus on universal primary education was not accompanied by a similar push to provide quality education or quality educational experiences, or to ensure inequalities at other levels of education were addressed. Improvements in adult literacy rates between 2000 and 2015 (the end of the MDGs), for example, were negligible, despite being a key goal agreed by the international community—in 2014, it was estimated that 758 million adults still lacked basic literacy skills, 63% of whom were women (UNESCO, 2016; North and Longlands, 2017). By 2015, it was thus clear that significant barriers and crosscutting issues internal and external to education had not been addressed and were having the greatest impact on the most marginalized children and adults, particularly women and girls (North and Longlands, 2017).

In developing insight into the failures of the MDG period, a number of recent comprehensive reviews on interventions for gender equality and girls' education (e.g., Unterhalter et al., 2014; Sperling and Winthrop, 2015; Parkes et al., 2016; Perezniето et al., 2017) highlight the significance of the disconnect between the gender and education policy community and scholars and activists working around gender equality and women's rights, which resulted in a squandered opportunity to develop more nuanced and sophisticated understanding of inequalities in and through education and effective ways to address them (North and Longlands, 2017; Unterhalter et al., 2022a). As we explore in the next section, this has significant implications for informing development planning for policy and practice, and for identifying the kinds of information and data that are needed to monitor and evaluate progress toward sustainable and equitable development.

Education, gender equality and measurement

Detailed information drawing on a range of data is central for assessing whether progress toward achieving gender equality and sustainable development within and beyond education has or has not happened and for holding those in power accountable (Longlands et al., 2021). Yet data and measurement frameworks (including the SDGs) that have been used to monitor change in these processes have remained disappointingly inadequate due to lack of resources, definitional challenges, and debates over both the problems and the solutions (Unterhalter, 2017; Wulff, 2020). What gender equality in education means, how it is understood and articulated through policy, and how it can be measured is far from straightforward. As a result, gender parity has remained the most widely used measure to describe features of gender and education (Unterhalter et al., 2022a).

Gender parity is conceptually straightforward, simple to understand and communicate, and largely relies on administrative data, such as enrollment or completion rates, that are relatively easily and routinely collected by schools or education authorities. As such, it has been an important metric for governments and practitioners for monitoring and communicating improvements in education participation, progression and academic achievement: aspects linked with the "what works" development agenda in particular. National education sector plans (ESPs), international assessment frameworks,¹ and the SDG indicators for the targets associated with SDG 4 all use gender parity as a key indicator, despite SDG 4 presenting a broader vision of gender equality in education beyond parity. But as has been widely documented, gender parity is limited in what it can tell us about the many diverse forms and sources of gender discrimination and injustice in education systems linked with, for example, policies, pedagogy, curricula and violence, or the ways in which gender intersects with disability, poverty, ethnicity or other dimensions of disadvantage – issues that impact on people's, particularly women's and girls', day to day lives and their experiences and opportunities in and through education (Parkes, 2015; UNESCO, 2020; Unterhalter et al., 2022a).

¹These include PISA (Programme for International Student Assessment) and PIRLS (Progress in International Reading and Literacy Study).

Adequately identifying and measuring forms of gender (in)equality in education beyond gender parity is thus vital for gaining more comprehensive insight into gender inequalities in education in order to meaningfully inform effective development strategies for quality education linked both with “what works” and “what matters” agendas. Yet, as Unterhalter et al. (2022a) outline, designing a measurement framework that can do this is challenging and requires engaging with significant conceptual, political and practical difficulties. Concepts are required that can review a wide range of interconnecting relationships between individuals, institutions and processes, and consider both education systems as well as the ways in which education connects with other areas of human development (Unterhalter et al., 2022a). Moreover, the multiplicity of sites of gender inequality, complex connections between forms of inequality and the need to build alliances to support change at multiple levels, requires a measurement framework that can be multifaceted and responsive to different individuals, institutions and education systems within and across diverse contexts. And in order to develop such a framework, a wide range of debate and discussion is important for understanding these inequalities locally and nationally, for gaining insight into how gender intersects with other forms of inequality in these settings, and for assessing relevant data for identifying appropriate indicators that can measure change.

The Accountability for Gender Equality in Education (AGEE)² project, coordinated by a team of researchers at University College London, has been engaging with these complexities to develop an innovative and comprehensive indicator framework for measuring gender inequalities and progress toward gender equality in education and sustainable development. The work of the AGEE project draws on the concepts and principles of the capability approach, which support alternative understandings and measures for gender inequalities in education beyond gender parity. The capability approach is a way of evaluating equality and social justice developed by Amartya Sen (e.g., 1999, 2011), Martha Nussbaum (e.g., 2011) and other human development scholars, such as Ingrid Robeyns (e.g., 2017). While this approach has informed additional key measurement frameworks within the field of international development, such as the Human Development Index, that attempt to capture a more holistic insight into intersectional inequalities,³ the AGEE project presents the first time such a framework has been developed specifically in the field of education.

The capability approach recognizes the effects of social, environmental, institutional, and cultural structures on individual people’s agency, choices and wellbeing and is concerned with evaluating what people are able to do and the lives they are able to lead. In terms of gender equality and education, this approach entails paying attention to the complexities of the physical, political and social environment and resource distribution, and the differences in how these can be converted into individual freedoms and opportunities within and through education (Unterhalter et al., 2022a). In order to understand these complexities, a key principle of the capability approach is that collective deliberation and democratic participation must be essential components of any development process.

Thus, the AGEE project team, in consultation with key stakeholders from national and local governments, bilateral and multilateral organizations, civil society organizations, researchers, practitioners and activists, has developed the AGEE Framework. This measurement framework is designed to facilitate, at local, national and international levels, multilayered analysis of gender inequalities in and through education, and the conditions that underpin them. This represents significant progress from the basic and often distorting analyses of gender inequalities in education that have relied on gender parity measures.

The AGEE Framework⁴ identifies six key interconnected domains, in which indicators are selected that take account of conditions both inside and outside schools linked with opportunities, freedoms and agency, as well as resources and measures of subjective wellbeing. The AGEE domains are: Resources (goods and services required for a gender equitable education system); Values (the context of how policy is understood, operationalized, or contested); Opportunities (factors that can constrain or enable gender equalities in education and the ways in which these are differently converted into actual opportunities by individuals and/or institutions); Participation in Education (gender differences in the capability to participate and progress in all levels of education); Knowledge, Understanding and Skills (learning areas and levels for girls and boys in relation to formal instruction and informal formation of attitudes), and; Outcomes (gender equality in, and support for, areas of human development, including girls’ and women’s health, employment, access to support to protect from violence, political participation, ownership of assets, and legal standing). Combined, the six AGEE domains allow for assessment of horizontal, vertical, and process inequalities, as well as how successful strategies and interventions for addressing problems have been (Unterhalter et al., 2022a).

While work on the AGEE Framework and associated indicator selection is ongoing, gathering information across each of the six domains can help inform more thoughtful and locally appropriate development strategies that can capture issues distinct to education systems as well as issues that arise through the ways in which education connects with other areas of human development (Unterhalter et al., 2022a). Such engagement with the complexities of identifying, measuring and addressing the many forms of gender inequality and associated forms of injustice within and beyond education is a significant leap forward for the international development community. It is a vital component for ensuring the many international and national agendas and promises for equitable education, lifelong learning, gender equality and sustainable development are fulfilled.

²See: gendereddata.org.

³These frameworks include: the Human Development Index (HDI) (<https://hdr.undp.org/en/content/human-development-index-hdi>), the Gender Inequality Index (GII) (hdr.undp.org/en/content/gender-inequality-index-gii), the Multidimensional Poverty Index (MPI) (<https://ophi.org.uk/multidimensional-poverty-index/>), the OECD’s Social Institutions and Gender Index (SIGI) (genderindex.org) and the Women’s Empowerment in Agriculture Index (WEAI) (<https://www.ifpri.org/project/weai>).

⁴See <https://www.gendereddata.org/framework/>.

As we explore in the next section, the various environmental, political, economic and health related challenges the world currently faces makes the urgency and significance of this work particularly acute.

Complex crises, emerging issues and challenges

The increasingly complex current global context, and the different forms of intersecting crisis, associated with, for example, COVID-19, the impact of climate change, and crises linked to conflict, displacement, or poverty in particular settings, have significant implications for the delivery of education and for monitoring and evaluating progress, especially in resource-poor contexts, which are often the targets of development interventions. The existing literature points to a number of ways in which a range of economic, political, climate and health crises have contributed to exacerbating gender inequalities in and beyond education. Studies in refugee and conflict-affected contexts, for example, have highlighted high risks of sexual violence and school drop-out among girls displaced by conflict (Falb et al., 2016; Schulte and Rivzi, 2012); while research following the 2004 Indian Ocean Tsunami highlighted increased barriers to girls' participation in schooling in affected areas (Zulfika et al., 2009; Ariyabandu, 2006).

More recently, an emerging body of research has explored the interactions between the gendered impacts of climate change and girls' schooling. Several studies have pointed to the significant implications of the changing climate for girls' and women's participation in education (see, for example, Rao et al., 2019a,b). This is highlighted in a recent review of the literature on girls' education and climate change (Sims, 2021), which suggests that climate change "threatens to reverse developmental gains made in access to education over the past couple of decades" (p. 3). The report highlights the multiple ways in which climate change, and associated extreme weather events, may disrupt learning, particularly in low- and middle-income contexts, and notes the "disproportionate impact on girls as barriers to their education are multiplied by the effects of climate change and environmental degradation" (p. 3). Such gendered barriers are linked to a range of factors including "an increase in household chores and responsibilities, which are typically allocated to girls in contexts where there are gendered norms; decisions to withdraw girls from education, prioritizing their male siblings' education; and, in some contexts, difficulties in managing menstrual hygiene" (Sims, 2021). Such impacts are felt most acutely by poor girls; the report (citing Atkinson and Bruce, 2015) notes that it is estimated that at least 200 million adolescent girls living in the poorest communities face heightened risk from the effects of climate change.

The global health crisis associated with the COVID-19 has also had significant—and gendered—implications for education in low- and middle-income country contexts. While research is still emerging about the impacts of COVID-19 on education around the world, research concerned with experiences of previous health crises, including those linked to Ebola and HIV and Aids, have highlighted the gendered nature of their impacts on aspects of education and schooling for girls. For example, the HIV health crisis (c. 1990–2010) brought attention to School Related Gender Based Violence (SRGBV), highlighting the potential for schools to intensify gendered forms of inequality as well as build equalities (Aikman et al., 2008; Morrell et al., 2009; Parkes, 2015). Research on the Ebola crisis, meanwhile, has highlighted increases in schoolgirl pregnancy, and incidences of violence against women and girls (Unterhalter et al., 2022b).

A systematic review of the evidence on the impact of school closures and children being out of school for extended periods due to environmental disasters, pandemics and violent conflict "points to these processes deepening gendered and intersecting exclusions and vulnerabilities" with disruptions in learning having particularly adverse effects on children from the most vulnerable socio-economic groups (Unterhalter et al., 2022b, p. 9), and initial research on the educational impacts of the Covid-19 pandemic, and the impact of school closures in particular, suggests similarly gendered patterns. Research commissioned by UNESCO (2021) on the impact of school closures due to Covid-19 in Bangladesh, Kenya, Mali and Pakistan, for example, found that school closures have gendered effects in relation to four key areas. Firstly, participation in remote learning was affected by gendered household demands, with girls experiencing particular increases in domestic responsibilities; secondly, girls' learning was constrained by a gendered digital divide, with girls less likely than boys to have access to the Internet or a mobile phone; thirdly, available data suggests gender disparities in return to school, with girls in Kenya less likely to return than their male counterparts; finally, the report highlights the pandemic's impacts on wellbeing beyond school, noting higher levels of stress, anxiety and depression reported among girls. A World Bank study (Dang et al., 2021), which analyses household level data from six countries in sub-Saharan Africa, similarly highlights how the crisis has deepened educational inequalities, as the poorest households were least able to provide learning activities for their children during school closures, although it does not consider the gendered dynamics of this.

It is clear that the complex and intersecting impacts of the current global context present significant challenges for the equitable delivery of education in resource poor settings, many of which were already grappling with existing crises. However, there has been limited work on joined-up actions, monitoring or research, which attend to the interactions between different forms of crisis and their wider implications for education and development processes. Paying closer attention to how we understand and monitor the impacts of these intersections is clearly critical in order to "build back better" and realize the potential of education to contribute to transforming gendered and other inequalities, as envisaged in the 2030 Agenda. This is essential if the global community is to improve on its track record with the MDGs and meet the more expansive aspirations for sustainable development and global flourishing set out in the SDGs.

Conclusion

This chapter has provided some insight into the ways in which, over the past few decades, the relationship between education and development has been conceptualized and approached through policy, practice and research. In doing so, it has outlined some of the longstanding and emerging challenges linked with identifying, understanding and addressing inequalities associated with education, particularly gender inequalities—challenges that are not easily overcome. As the contemporary period of complex crisis makes strikingly clear, however, the significance of education for reframing how we think about and value each other and the world we live in, and for addressing the many short- and long-term impacts of inequalities for current and future generations, must not be underestimated. The challenge going forward is to develop coordinated, collaborative and multi-layered approaches that build on examples of good practice and take account of what research and experience tells us to develop strategies that can truly deliver substantive and sustainable change and turn global and national commitments on equality in and through education into meaningful action and practice on the ground. This requires engaging with different viewpoints, building alliances, and channeling sufficient resources into local, national and international efforts, so that rather than continuing to simply focus on changing what is easy, we can together understand and change what really matters.

This entry problematizes the relationships between education, knowledge and power but locates this debate in current relevant social processes, such as globalism, nationalism (ethnonationalism) and social justice. The present discussion provides concrete ways to analyze power in education. Power is assumed to be everywhere, but a guide on how to understand the operationalization of power is a necessary contribution, particularly in the field of education. The inclusion of this entry in the section on “diversity, democracy and social justice in education” provides different angles on the realities of territories where diversity is not always accepted, where democracy is not always an ideal and where social justice seems as though a utopic fantasy.

Ideologies and politics need to be taken seriously when educational change is at stake. The entry first presents the conceptual puzzle on education, knowledge, power, globalism, (ethno)nationalism and social justice. Then, it suggests ways to analyze their relationships and hierarchies. Finally, two case studies are presented and contrasted to show the applications and implications of this entry's content.

Power

Every social interaction is affected by power, and education is not an exception. *Discipline and Punish: The Birth of the Prison* by Michel Foucault was not the first book to discuss the issues of power and education, but it was a crucial text that broadened this debate. Other authors with critical views, the large majority of them from a post-Marxist approach, continued the conversation. These authors include Louis P. Althusser, Samuel Bowles, Herbert Gintis, Michael Apple, Thomas S. Popkewitz and Stephen J. Ball. What has been made clear is that a theory on power in education is missing, and what has been written needs to be updated and presented in a more organized manner.

Power can be identified in different ways as force, potency, act, possibility, faculty, capacity, action, authority, reactance, punishment and coercion. Also, power is related in one way or another to legitimacy, conflict, resistance and violence.

According to Giddens (1984), “Power’ is very often defined in terms of intent or the will, as the capacity to achieve desired and intended outcomes. Other writers by contrast, including both Parsons and Foucault, see power as above all a property of society or the social community” (p. 15). This assumes power in both senses, and it emphasizes the exercise of power as a human quality and a force present in all human activities. More importantly, power could help knowledge and education become spaces of social transformation.

In fact, few things are more powerful than education and knowledge. The act of deciding what should be taught to children and youngsters makes education one of the most important social activities. It is hard to find another more important activity in society. The intention of curriculum content is to establish what knowledge is valid, legitimate and useful for youth. Current debates have to do with what topics of sexuality, religion, race or history must be taught at schools, at what levels and in what types of institutions. Each country is waging its own internal battles over the degree to which its education is technological, general, Western oriented or liberal (Carnochan, 1993). Ideology and politics play major roles in such curriculum decisions. Additionally, these discussions have to do with levels (primary, secondary, high school, higher education) and age, up to the point of what professions should be taught, what disciplines must be included, or in a broader sense, what type of training citizens require.

This entry suggests a way to organize the debates on power and education. First, this work proposes four scales to understand power in education: agents, symbols, structure and processes (see Fig. 1). *Agents* include teachers, students, superintendents, deans, academics, unions, leaders, collectivities, professional associations, accreditors, academic associations, institutions, governments, countries, politicians, guilds, states, nation states, decision makers, bureaucracies, elites, civil society and stakeholders. *Symbols* include ideas, theories, policies, knowledge, ideologies, creativity, narratives, ideals, dreams, traditions, emotions, values, morals,

culture and prestige. *Structure* can include colonialism, language, rules, normativity, law, context, legacy, legitimacy, networks, economy, political systems, technology, gender, curriculum, degrees, credentials, money, infrastructure and disciplines. Finally, *processes* include learning, teaching, researching, evaluating, shaping behaviors and disciplining.

The inclusion of an element on one scale does not mean that this element cannot be part of another scale. In this scheme, agents and structure are obvious elements, since they are part of a classic sociological debate, but the inclusion of processes and symbols is an addition. The idea behind including processes is that they are exercised by agents in particular structures, but a process is difficult to capture as a single moment or circumstance. The same situation occurs with symbols. An element identified as a structure can have a symbolic heavy load, but it is important to try to differentiate between the different spaces occupied. In the case of symbols, this scale of power is less analyzed in education but one of the most powerful. This is problematic since symbols cannot be objective or measured; most symbols do not contain single meanings. Symbols are essentially embedded in the cultural background.

Second, there are some questions that will help reflect on power in education. [Zelditch and Walker \(2000\)](#) pointed out that the “adequate description of power relation will typically refer to: (1) the bases of power; (2) the means of power; (3) the strength of power; (4) the costs of power; (5) the amount of power; (6) the scope of power; (7) the domain of power” (p. 1457) ([Fig. 2](#)). This applies to education at its different levels (primary, secondary, tertiary, etc.), types (formal, informal and non-formal) and modalities (traditional face-to-face learning, distance learning, blended learning, home schooling, etc.) ([Fig. 2](#)). In the case of education, each of these aspects has different possibilities and could respond to a different question. The bases of power in education may respond to the following questions: What role does education play in society? What are the sources of legitimacy, and what is the origin of the power that every actor has in educational processes? The means of power in education are related to the following questions: What does power in education symbolize? What are the different ways power is held (prestige, authority, discipline or recognition)? Does the strength of power have to do with the different intensities of the forms of power in education? The cost of power is related to the following question: What does it take to hold power in the educational context? What is the price that different agents have to pay to hold such power? The amount of power in the context of education may respond to the following question: How much power can someone exercise? Is it possible to establish certain scales to determine the quantity for power? The issue of soft power may be incorporated here. The scope of power in education should answer the following: What is the range of power that an agent, a structure, a symbol or a process can maintain? Finally, the domain of power has to do with the spaces where power can be exercised. Can it be an institution, a country, an educational level, an educational system or a curriculum?

Power is everywhere but naming where and in what ways it is present is required. In this case, once there is a way to organize the debate on power and education, the second aspect is to consider the purpose of using power. Ideally, power must be used to challenge the present reality of education and to improve people's conditions.

Knowledge

The relationship between power and knowledge has been widely discussed in the literature. [Foucault \(1992\)](#) was one of the first to elaborate on the complexity of this relationship (as cited in [Eribon, 1992](#)). Knowledge is one of the most important human

Fig. 1 Scales of power in education.

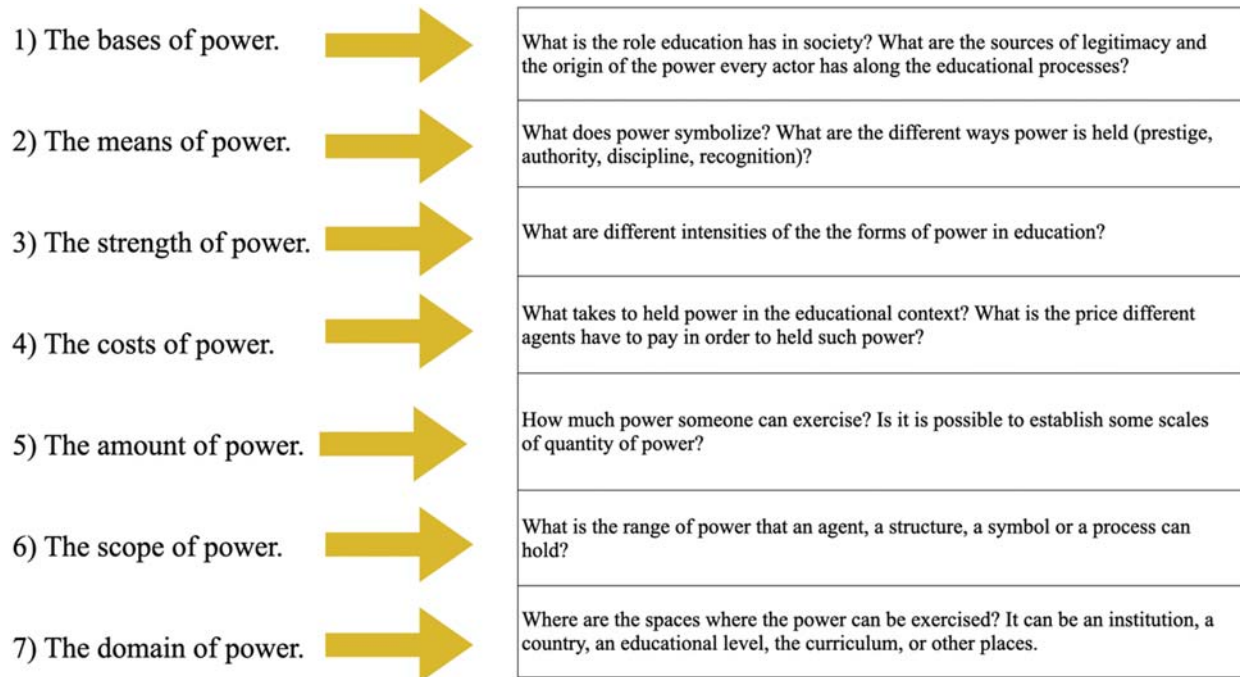

Fig. 2 Ways to analyze power in education. Based on Zelditch and Walker (2000).

characteristics, as it is attached to power in most forms. There are different types of knowledge, and it has a lot to do with legitimacy. Currently, possessing knowledge means acquiring power on different scales.

According to Plato, knowledge does not only function as reason or the state of pure intelligence; true knowledge also means the love to know and to acquire wisdom (Xirau, 1990). Knowledge is considered a commodity and a public good. This has also occurred with education, where depending on the level, education can be considered a public good, a commodity, a public service or a right. One difference between knowledge and education is accessibility. Knowledge has the quality to be a public good because its use does not prevent other people from acquiring it. Stiglitz (1999) pointed out that “a public good has two critical properties, non-rivalrous consumption—the consumption of one individual does not detract from that of another—and non-excludability—it is difficult if not impossible to exclude an individual from enjoying the good” (p. 1).

Knowledge can be considered a public good and subject to commodification as an educational product and as a product of academic research (Kauppinen, 2014). Indeed, the idea of knowledge as a commodity has become more common. The increased prevalence of this idea is related to the increase in market-oriented public policies. There is knowledge that represents more value than others. In particular, applied knowledge allows innovation and helps to develop industries. As an example of this value, the World Trade Organization (WTO) estimates that the revenue produced by the commercial transactions of intellectual property produced about \$429 billion (Maldonado-Maldonado and Cortes-Velasco, 2021). Countries tend to calculate intellectual property payments and receipts, which give an excellent idea of their relevance as not only knowledge consumers but also producers. However, this results in a paradox when considering the fact that “Knowledge knows no borders. It is freely circulated internationally, even when governments attempt to restrict its flow. The development of an international network of knowledge distribution is by no mean a new phenomenon” (Altbach, 1987, p. 65). On the one hand, the revenue produced by selling and buying knowledge is an economic measure and part of an international competition, especially among the richest and most powerful countries in the world, but on the other hand, knowledge has been part of international exchange and an element of international cooperation, and some of the most important scientific discoveries in recent times were made possible by historically established international collaborations.

In fact, the Organization for Economic Co-operation and Development (OECD) has coined the term “knowledge-based economy” to describe current economies’ dependence on knowledge production; the knowledge-based economy refers to a certain type of knowledge, particularly applied knowledge related to innovation and technology. According to the OECD (1996), there have been “trends in advanced economies toward greater dependence on knowledge, information and high skill levels, and the increasing need for ready access to all of these by the business and public sectors”.

Other international organizations have preferred to use the concept of “knowledge society”, which are

[...] Capabilities to identify, produce, process, transform, disseminate and use information to build and apply knowledge for human development. They require an empowering social vision that encompasses plurality, inclusion, solidarity and participation.

UNESCO (2005).

Knowledge is a social construction, and “knowledge is all around us” (Sloman and Fernbach, 2017, p. 13). These authors mentioned, “We have access to more knowledge today than ever before We live in a community of knowledge” (Sloman and Fernbach, 2017, p. 13). In many ways, the power of knowledge resides in such a collective characteristic. This is the same reason knowledge is used to label societies or economies that depend on its production to subsist, develop and make broader the differences among countries.

On the role of basic scientific knowledge and what it takes to produce it, Merton (1996) pointed out the following:

[...] Science is a deceptively inclusive word which refers to a variety of distinct though interrelated items. It is commonly used to denote (1) a set of characteristic methods by means of which knowledge is certified; (2) a stock of accumulated knowledge stemming from the application of these methods; (3) a set of cultural values and mores governing the activities termed scientific; or (4) any combination of the foregoing (p. 267).

Nowadays, knowledge is no longer produced exclusively at higher education institutions; there are new actors that include industries in the private sector, private laboratories or other private enterprises. However, basic science is still mostly produced at public and private higher education institutions where autonomy, academic freedom, graduate students, postdocs, financing, resources, infrastructure, the academic community and other elements facilitate the development of academic research and science. Furthermore, the knowledge production ecosystem goes beyond higher education institutions, research laboratories or centers; “It broadly includes government science ministries and research councils, certain enterprises and other private bodies, and supporting infrastructure” (OECD, 1996, p. 21).

According to Clark (1983), higher education is constituted by groups of people who carry knowledge. The more the knowledge is multiplied, refined and segmented, the more it becomes something peculiarly slippery and invisible (Clark, 1983). In the same sense, Altbach (1987) pointed out that “the educational system is one of the most important consumers and creators of knowledge” (p. xi). In particular, higher education institutions are part of the chain of knowledge distribution and some of the main publishers of scientific papers. Furthermore, “Universities are publishers, and such are direct contributors to the knowledge dissemination system. The most direct and obvious publishing activity of a university is that of the university press” (Altbach, 1987, p. 69).

Aside from scientific knowledge, there are other types of knowledge, including popular, Indigenous, intuitive and theological. Knowledge can be partial, limited, unlimited, unconditional or conditional. The OECD (1996, p. 12) highlighted four ways to refer to knowledge: know-what (facts), know-why (principles and laws of nature), know-how (skills or the capability to do something) and know-who (about the subject who knows how to do that).

There are important debates against the discrimination of certain types of knowledge, particularly Indigenous knowledge in colonized countries. Decolonial positions (Bidaseca, 2016; Dussel, 1988; De Sousa Santos, 2021) suggest that maintaining a single idea about knowledge excludes other cultural alternatives or possibilities in terms of its definition, validity and accuracy. The debate in this case has to do with whom decides on what type of knowledge is legitimate. According to Young (1995), “colonial discourse analysis was initiated as an academic sub-discipline within literary and cultural theory by Edward Said’s *Orientalism* in 1978” (p. 159). It seems to prevail a powerful Eurocentric vision about how to define knowledge, modernity and peripheries (Dussel, 1998, pp. 62–63).

One criticism decolonial authors have made has to do with the kind of voices that are represented in the debates and who has assumed the representation of “others”. As Young (1995) pointed out, “In recent years there has also been a growing unease about the tendency of anti-Eurocentric writing to homogenize not just the “Third World” but also the category of “the West” as such—by writers who are of course, very often themselves the product of that same ‘West’” (p. 165).

The dominant role of scientific knowledge over other types of knowledge cannot justify, by any means, the attack science has faced lately from religious fundamentalists, populist governments, dogmatic ideologies, authoritarian regimes, ethnonationalists and extremists, among others (Deaton, p. 326).

Ethnonationalism

The concept of ethnonationalism links the idea of the nation to a particular ethnic identity. This implies the possibility that nations share a common heritage. However, this assumption is problematic in different ways, particularly when it is used to justify wars, invasions or interventions in public policies to stop immigrants with different ethnic backgrounds from getting into a particular country because the dominant powers are afraid of what “the other” represents.

Ethnonationalism might imply the use of the same language, historical background, religion or territorial limits. It is even more problematic if it implies what can be considered a common genetic ancestry. In the preservation of these elements, the idea of ethnonationalism tends to exclude or reject the idea of multi-ethnic societies. Defining a single ethnic identity challenges the reality of geographical mobility and its impact on migration.

Nationalism is a movement defined by the construction of historical and cultural identities. Adding the ethnic aspect constrains this identity on racial or genetic characteristics that are biologically unsustainable. To provide a clear example, Nazism and other similar extreme movements have been nourished by ethnonationalist ideologies. Ethnonationalism can inspire xenophobic

responses. In less extreme cases, ethnonationalistic ideologies can provoke a hostile external environment, such as in a country like Korea, where they are surrounded by important geopolitical powers (Lee, 2009).

Young (1995) summarized how problematic the ideology of race is, as well as its implications and origins:

The ideology of race, a semiotic system in the guise of ethnology, “the science of races”, from the 1840s onwards necessarily worked according to a doubled logic, according to which it both enforced and policed the differences between the whites and the non-whites, but at the same time focused fetishistically upon the product of the contacts between them (p. 181).

Young (1995) also indicated that the idea of racism operates by “the determination of degrees of deviance in relation to the White-Man face” (p. 180), which means that the parameter of comparison, ethnically speaking, is a Eurocentric, malecentric and Whitecentric figure (always in prejudice to those who are different, to otherness). A particular ethnic group is more likely to be racist if this group feels a threat to its dominance with the incursion of other ethnic groups (Connor, 1984).

Similar to nationalism, ethnonationalism is closely related to the concept of the “self-determination” of nations (Connor, 1973). Self-determination was a way to affirm the existence of new countries. Similarly to defining a nation based on cultural heritage, defining it based on ethnic heritage is also problematic. As pointed out by Harari (2013), one key question is what legacy the nation decides to take, unless people are able to accept that it is normal to tend to choose the side of the victors or losers.

Migration, which is one key element of globalism, represents a major threat to ethnonationalism since migrants not only bring different cultures, but they look different in most cases. Migrants from developing countries are ethnically diverse compared to the traditional populations in developed countries, which are the places to which they migrate.

Globalism (or globalization)

Globalism or globalization contradicts the idea of ethnonationalism, and in general, it challenges the idea of nationalism. Globalization has to do with the diminishing of national borders, the regional integration of countries, the increase of commercial, educational, economic and political exchanges and individuals’ realisation of these processes and actions in consequence (Waters, 1995). Globalization has erased the borders between them and us, the near and the distant (Lipovetsky and Juvin, 2010). Globalism imposes the vision that the planet is one. There are global problems, global solutions, global organizations and global non-governmental organisations (NGOs) among other actors. Integration between regions and nations has increased in recent decades. Mass media, technology, transport and pop culture have accelerated the idea of worldwide interconnection (Murray and Overton, 2006).

Globalism does not mean the end of the state or the end of the idea of the nation, but as Castells (2000) argued, it does imply its transformation. This is where the element of sovereignty becomes relevant. What are the changes that national states are able to implement to become part of global processes? What are the types of concessions governments are able to make, and how do they exercise their power?

Globalism has winners and losers, and for a long period of time, many problems in the world have been attributed to this axis. This is explained by the fact that economic globalization has caused other forms of global processes, such as cultural or political globalization, to collapse (Noya and Rodríguez, 2010). The failures of the global market economy are considered a consequence of globalization. “Markets are supposed to be stable, but the global financial crisis showed that they could be very unstable, with devastating consequences” (p. xi), as Stiglitz (2012) pointed out. Castells (2000) clarified that the “global economy was not created by markets, but by the interaction between markets and governments and international financial institutions acting on behalf of markets—or of their notion of what markets ought to be” (p. 135). In any case, Deaton (2013) is very conclusive in this respect: “Globalization has made the world more unequal, that while the rich have been presented with new opportunities for getting richer, the poor of the world have gained little” (p. 257).

One of the main challenges of globalization did not come from left-wing movements but right-wing leaders, particularly populist leaders like Donald Trump (USA), Boris Johnson (UK), Jair Bolsonaro (Brazil), Narendra Modi (India) and Andrés López Obrador (Mexico). These leaders are nurtured by nationalism. Their position against globalization is to blame the global integration of the planet as the main reason for the national crisis in their countries and as a barrier against their progress.

Stiglitz (2002) argued that globalism is neither good nor bad. There are some positive aspects that have resulted from this phenomenon. For example, a global civil society has been formed to defend a global agenda, such as the fight against climate change. He sees the role of knowledge as another component that enables nations to get some advantages from globalism: “Globalization has reduced the sense of isolation felt in much of the developing world and has given many people in the developing countries access to knowledge well beyond the reach of even the wealthiest in any country a century ago” (Stiglitz, 2002, p. 4). In the same sense, Castells (2000) understands that “global technological development needs the connection between science, technology and the business sector, as well as with national and international policies” (p. 126).

Nevertheless, globalism is responsible, in part, for inequalities around the world. This is where the last concept in this entry enriches the debate.

Social justice

The scarcity of all types of goods and resources underlines the problem of what the best way to decide the fair distribution of them is. Depending on the goods and resources, scarcity can be strong or weak, natural, almost natural or artificial (Elster, 1992). The pursuit of justice is derived from the idea of fairness. There is a matter of deciding who should aspire to receive what benefits, what the role of social institutions is in making sure there is a fair distribution and what injustice a society is capable of admitting.

When the process of globalism started, it was believed that a new moral planetary consciousness was born. The possibility of creating global justice seemed realistic (Noya and Rodríguez, 2010); however, this illusion soon vanished. The question asked by Amartya Sen (2009) is very pertinent: “What international reforms do we need to make the world a bit less unjust?” (p. 25). In looking to answer this question, it can be noted that egalitarian values clash with libertarian values when interventions about how to mitigate inequalities have to be defined, including who needs to intervene to reduce gaps in equality in society (normally would be the state). Atkinson (2015) suggested that “the achievement of an equitable society depends to a considerable degree on the effectiveness of the public administration and the quality of its dealings with citizens” (p. 122). In the same sense, Stiglitz (2012) stated that “we have to rein in the excesses at the top, strengthen the middle, and help those at the bottom. Each goal requires a program of its own. But to construct such programs, we have to have a better understanding of what has given rise to each facet of this unusual inequality” (p. 29).

The ideal of social justice represents the possibility of change. Collier (2008) called attention to the bottom billion of the poorest people of the world who are trapped by socioeconomic and political conditions. The debate has focused more on inequality as the main problem to solve than on the face of social justice.

“Citizenship premium” is how Milanovic (2017) refers to the advantage someone has when the person is born in a rich country. The issue is how to avoid providing advantages to particular people just because they are luckier to be citizens of a country than others from a different nation or because they are born into a wealthier family than someone else. An accident, or fate, cannot be the only reason why some have better possibilities for development and better opportunities than others.

According to Milanovic (2017), malign and benign forces reduce inequality. Among the malign forces are wars or civil conflicts, and the benign forces include social pressure, increased education, aging and technological change—in other words, issues related to knowledge production. Piketty (2014) goes in the same direction:

Historical experience suggests that the principal mechanism for convergence at the international as well as the domestic level is the diffusion of knowledge. In other words, the poor catch up with the rich to the extent that they achieve the same level of technological know-how, skill, and education, not by becoming the property of the wealthy. The diffusion of knowledge is not like manna from heaven: it is often hastened by international openness and trade (autarky does not encourage technological transfer). Above all, knowledge diffusion depends on a country's ability to mobilize financing as well as institutions that encourage large-scale investment in education and training of the population while guaranteeing a stable legal framework that various economic actors can reliably count on. It is therefore closely associated with the achievement of legitimate and efficient government. (p. 71)

Most authors who discuss inequality agree with the importance of education, technology and knowledge to narrow inequity gaps. However, few have suggested specific ways in which this can be made possible. Even less of them have debated on the structural elements that preside over people's access to education, knowledge or technology, or recent topics such as the role of meritocracy and the real chances of having equal opportunities or an even starting point.

Atkinson (2015) wondered how much inequality is acceptable, and this is where the idea of social justice acquires relevance. Additionally, this is where power, knowledge and education became transcendent in looking for a fairer world. Sen (1999) would refer not only to looking for a better distribution of primary goods but to looking to provide capabilities to all humans, bolstering their chances to develop their potential.

Case studies

Chile and Mexico are two Latin American middle-income countries. Both are members of the OECD, and both have democratic regimes. However, there are many differences between the two. First, Chile has a population of about 19.1 million, and Mexico has a population of about 128.9 million. There are considerable geographical, economic and historical differences, but they also share the Latin American cultural identity, language, problems and challenges, and both nations were colonized by the Spaniards. In recent times, both countries have faced major political shifts with the election of left-wing presidents, but with different characteristics. Gabriel Boric, the president of Chile, was born in 1986. Andrés Manuel López Obrador was born in 1953. Boric was elected president when he was 36 years old. By the time López Obrador was 33 years old, Boric had just been born. Boric had a trajectory into politics as a student activist at the University of Chile, and López Obrador was a social activist part of the official political party that had been in power for 71 years (Partido Revolucionario Institucional, or PRI).

Both presidents have a strong agenda regarding social justice issues. This partially explains their electoral victories. Inequality is a major characteristic of most Latin American countries. There are very important segments of the population living in poverty. When Boric, López Obrador and other candidates in countries such as Colombia, Brazil, Argentina or Peru speak, they are talking

to the most vulnerable populations who have witnessed injustices, lived under the oppression of the elites, suffered scarcity and seen how they have been left behind.

Generally, political campaigners make promises, this is not new. In the case of the promises these candidates and later presidents have made, only their higher education agendas are considered here with an important clarification: by the time this entry was being written, López Obrador was in the middle of his term (third year out of six), and Gabriel Boric was just at the beginning (first year out of four), so it is hard to compare their results; instead, it is fairer to compare their proposals.

Andres Manuel López Obrador proposals

López Obrador made four key higher education-related proposals as a presidential candidate. The first was free education at all levels, including higher education and graduate education. Second, entrance examinations to higher education institutions should be eliminated. Third, which was the only one included in the official document “Nation Project 2018–2024”, autonomy should be provided to private higher education institutions. The fourth was the opening of 100 new universities (Universidades para el Bienestar Benito Juárez García). These universities were planned to be built in the poorest areas of the country (Rodríguez and Maldonado-Maldonado, 2019).

Gabriel Boric’s proposals

Boric’s presidential campaign identified six important issues. The first had to do with forgiving student debt and establishing a credit system in the short term to transition to universal free higher education. The second included rebuilding and expanding public free and quality higher education, including increasing public funds. Third, the goal was to improve free education and financing policies. Fourth was a new policy to promote access and permanence, which included the establishment of affirmative action policies. Fifth was to conceptualise and improve the comprehensive quality of higher education and refine gender policies. Sixth was transforming technical and professional education, modernising these fields and eliminating the for-profit technical and professional education (Boric, 2022).

In accordance with the four scales of power in education—agents, structure, symbolic and processes—Chile and Mexico represent two cases where the new leaderships are aiming to transform the social reality and looking to create a context where social justice should prevail. The four scales help clarify where power and education struggles take place. The agents are relevant and as follows: two leftist presidents, opposition leaders, the senate and legislatures, sectors traditionally excluded from higher education, elites, higher education institutions, academics, accreditation bodies or professional associations, among others. The processes refer to the different moments when these change projects are developing with respect to decision-making processes. The symbolic has to do with the ideologies and new narratives that have been built, such as changing the higher education systems in both countries and challenging the traditional practices of higher education institutions that have created major inequalities in access. The structures seem the most difficult change at a significant scale because they refer to the laws, norms and political and economic systems in these countries. Dissecting the different elements helps to understand the dimensions of the problem when it is a matter of creating change.

The scales, together with the questions proposed by Zelditch and Walker (2000), are as follows: What role does education play in Chile and Mexico? What are the sources of legitimacy for the two relatively new governments led by López Obrador and Boric? How do prestige, authority, discipline and recognition take place in the educational context of each society? How much power can both leaders exercise to push for changes in education? Among other questions, they can serve as a good guide for exploring the situation in each nation.

On the one hand, López Obrador decided to stay at the scale of the symbolic—the narratives and the ideals—but did not look to change structures. The policies that have been implemented are hardly going to change the stratification of the system or reduce the inequalities in access to the tertiary education sector in Mexico. For example, the so-called 100 new universities cannot be considered a success, as they do not have enough resources, the program offered are very limited, they are not located in the poorest regions of the country and they do not have enough faculty, students and infrastructure to operate, but they have been promoted as an important governmental achievement. There are a lot of concerns about the outputs of the policies implemented by the López Obrador government, particularly because the promise of free higher education seems unreachable in a country that has not looked for fiscal reform (despite the fact that his government does have the majority to pass it) and whose economic policies are continuing to reduce public spending in education and science.

On the other hand, Gabriel Boric is looking to change the taxation system and the country using a previously decided process to reform its constitution in a process that had been initiated before the presidential election. The current constitution is a relic of Augusto Pinochet, the dictator who ruled Chile for 17 years. After several political movements (some led by student activists such as Boric), most Chileans decided that on September 4th 2022, there would be a plebiscite to vote for the new constitution. The project includes 388 articles, which, if approved, would be one of the largest constitutions in the world (Propuesta: Constitución política de la República de Chile, 2022). The Constitution proposal establishes that the State will ensure access to higher education for all persons who fulfill the requirements. Access will be governed by equity and inclusion principles, focusing on historically

Fig. 3 Knowledge/power and education: ethnonationalism, globalism and social justice.

excluded groups. The fiscal reform, which looks to tax the rich to finance social rights, does not have an easy road to approval, since Boric does not have the majority in Congress. His government is in the transition phase from symbolic to structural changes.

The four scales proposed in this entry do not suggest that there is a route to follow to instigate an educational revolution, but they serve as a map to see how an educational system (in this case) operates and how to understand the roles of agents or the timing of the processes.

Populist narratives are very attractive. Promising to modify higher education entrance requirements to end the exclusion that many segments of the population have historically experienced is also appealing. Some of these narratives oppose globalism, considering that it has done more harm than good, and use nationalist and ethnonationalist ideologies to support their causes. Nevertheless, if legal, economic or political structures are not changed (because governments do not want or because there are impossibilities to do it), the symbolic scale helps a candidate get elected or get public support, but it does not help to reach social justice. A review of the other scales would help us comprehend the possibilities of change in education and how the exercise of power would make an impact.

In sum, the opportunities to exercise power to transform education and make it something more than a reproductive instrument, the dissemination of knowledge as a public good and the development of scientific research, innovation and technologies could be a way to face ethnonationalist, populist and dogmatic regimes, to find better ways to take advantage of globalism, to reduce inequalities and to search for a world where social justice is the common characteristic and not a mere accident that happens here or there occasionally. The idea behind integrating all these elements in this entry, including two concrete cases of its usefulness is to propose an approach to continue with this discussion. It is relevant to reflect on each element separately and then suggest a way to put together all the elements to move forward (see Fig. 3). The ultimate purpose is to create a more democratic and a fairer world.

Introduction

The pandemic has been a watershed in our history that will change how we live, work, and relate to each other as human beings as well as how we think of ourselves after months of confinement and continuing uncertainty. The pandemic has revealed the effects of inequality that exist among nations and within societies, and exposed major cracks in societal institutions all over the world. The lingering effects of imperialism, slavery, settler colonialism, and genocide continue through the uneven distribution of wealth, the inequality of living conditions among people of the world, climate change, and devastation (Douglass and Cooper, 2020) as well as an increase in militarization, corruption, violence, war, and human migration (Amin, 2020). In 2018, 70.8 million people were forcibly displaced around the world (United Nations High Commissioner for Refugees [UNHCR], 2019). In 2019, there were 272 million international migrants—3.5% of the world's population—living in a country where they were not born (International Organization for Migration [IOM], 2019). While the overwhelming number of people leave their home for work, family, or study, many are forced to leave to escape violence, conflict, and climate change.

Movement of people has been greatly disrupted due to responses of societies to the pandemic and the unequal ability of countries to control the COVID-19 virus and its variants. While this is likely to be temporary, migration patterns have become more complex and are likely to continue to increase in volume, scope, and diversity of populations. This is largely due to globalization and the technological revolution which have dramatically increased worldwide interconnectedness. Technological advances have facilitated travel as well as communication and education. The international movement of people has increased diversity and its complexity in societies around the world, and consequently in school populations. This super-diversity (Vertovec, 2007) involves various forms of affiliation and belonging, and different experiences due to multiple identities and their intersections. Super-diversity cannot be understood as static, because individuals' identities are changing and fluid.

Diversity implies difference, and difference is defined through identity. The interrelationship of difference and identity has played a significant role in the development of Western philosophy, and since the 1960s the topic has been prominent in cultural studies. Traditional views of identity consider the concept as fixed and unitary. Poststructuralist and postmodern perspectives view identity as being constructed relationally, and therefore, the concept has meaning only in relation to difference (Ghosh and Galczynski, 2014). The meanings given to differences based on race, ethnicity, culture, religion, gender, sexual orientation, dis/ability and other such constructs are influenced by history and structures of power. Given the changing nature of structures of power, who and what is different is always shifting. For example, one group that is seen less favorably today may be supplanted by another group which then becomes marginalized. Therefore, difference and identity are constructions that are always in a state of flux and shifting and "must be continually reinvented within new and changing circumstances" (Dolby, 2000, p. 901).

In the contemporary world, *globalization* implies global flows of people, technology, images, ideas, and money which can cause tensions between cultural homogenization and heterogenization (Appadurai, 1996). Perhaps the greatest danger of globalization is loss of identity. On the one hand, globalization results in homogenization by spreading a consumer culture that is ubiquitous and erodes local cultures and identities through mass media by "saturating the cultural space of a nation" (Schiller, 1985, p. 18). On the other hand, this cultural assault causes anxieties in individuals and groups who want to be recognized and assert their distinctive identity or culture. So, there is a tension between homogenization or sameness, and heterogenization or openness to difference due to diversity. This tension is present in all societies that have been touched by globalization and has given rise to identity politics resulting in a wide range of political activities based on different groups' experiences of injustice. With the spread of democracy, education, and awareness of human rights, the demand for recognition of different cultural identities by all groups is rising.

This chapter looks at ways educators can rethink the concepts of difference, diversity, and identity given this background of tensions caused by the global movement of people. Even in countries where there have been minimal demographic changes,

the push for inclusion has forced people to rethink existing differences among people in their societies, especially people with physical and mental challenges. The United Nation's Sustainable Development Goals (2015b) have emphasized inclusive education which focuses on those who have hitherto been excluded from societal institutions, including educational institutions, because of their differences. The chapter begins with a discussion of difference and diversity, followed by an exploration of the concept of identity. It shows the role of education in the development of identity and some of the problems that may arise when identity development is neglected or obstructed. It briefly touches on educational programs that could support positive identity development and ends with the implications of identity in teacher education.

Difference and diversity

Difference

There is an astonishing variety of difference among human beings in every aspect whether it be individual abilities and physical characteristics or social and geographical positioning. Difference is a comparative term. The Oxford Dictionary defines it as "that which distinguishes one thing from another." Several questions arise from this definition: Different from whom? Different in what way? In the context of individual and cultural identity, difference is measured against a norm and the norm is defined by the dominant group which has power and whose characteristics become the standard. Those who do not fit the model are different and become *the other* (Ghosh and Abdi, 2013).

Who is seen as different? It is *the other* who is different: the woman is different from the man; gays and lesbians from heterosexuals (Pandey, 2010). In the United States, Canada, Australian, and European contexts the black or brown person is different from the white person. In the context of education, the black student is different and the white student is the norm. Difference here is an expression of dominance and subordination, hierarchy in social, political, and economic power. In South Asian countries, the lower castes are different. Thus, the meanings given to differences is a way of legitimating, normalizing, and reinforcing hierarchical power relations (Ghosh, 2012).

But, as Hall (1991) has pointed out, difference is not a static, fixed reality; difference is always constructed. Markers of difference have mostly been race/ethnicity, gender, culture, religion, language, socio-economic class, caste in India/South Asia, sexual orientation/identification, and disabilities. Difference is based on socially created categories built on physical (race/ethnicity), biological (gender based on sex), and socio-economic (class) characteristics.

Evolutionary theory points out that group living is an adaptive strategy for the human species and critical to reproduction and human survival against hostile environments (Van Vugt and Schaller, 2008). Van Vugt & Schaller point out that groups evoke feelings of loyalty and solidarity leading to tribalism and ethnocentrism in which people are aware of within group physical differences but attach minimal importance to them. However, these feelings of togetherness also lead to rivalry and exclusion of other groups resulting in racism, hate, and exclusion of the other.

Racism, which is extremely damaging to one's identity, is generally considered "an assertion of Western cultural superiority" (D'Souza, 1995, p. 537) that is a direct result of colonialism. The classification of people into hierarchies of "races" by Europeans during colonization was based on select physical characteristics and social constructs. Similar to racism rooted in colonialism, the caste system in India is rooted in Hindu texts and is a hierarchal form of social stratification. It is hereditary, and the markers of difference are derived from religion and cultural notions of purity and pollution rather than physical differentiation. Although it originated in the Hindu scriptures, it has penetrated all religious groups across South Asia. Its impact is enormously damaging to the identity and all aspects of the lives of those who are subject to *casteism*, or discrimination based on lower caste status. The Indian Constitution prohibits discrimination based on caste but legislation has not removed caste discrimination in society, which is often violent and prevalent in many parts of the country. Similarly, the concept of race is very much alive in countries of the Global North, as highlighted by the Black Lives Matter (BLM) movement. Racism exists even when it is illegal, and despite lack of scientific basis for it. "Caste and race are interchangeable in terms of their potential for human wrongdoing or evil" (Thirumal, 2021). It should be noted that there are ostracized groups in other parts of the world such as the Burakumin in Japan and Korea, Osu in Nigeria, and similar communities in other parts of Africa (EPW Engage, 2021).

Biologically, "humans share 99.9% of the same DNA. The physical differences we observe (e.g., skin color, eye color, hair texture, bone structure) are known as clines, which do not qualify humans to be distinguished into different biological races of people" as stated in National Human Genome Research Institute (2018) and Sussman (2014) (Svetaz et al., 2020, p. 313). Nobel laureate Toni Morrison explained, "There is no such thing as race. None. There is just a human race—scientifically, anthropologically. Racism is ... a social construct ... it has a social function, racism" (2014). So, while race has no scientific basis, it is a powerful social and political force, and racism is prevalent in many areas of the world, greatly affecting the identity and every aspect of the lives of those who experience it.

Concepts of race, ethnicity, gender, and class are social constructions. They are inherently political because they result from the power to exclude and serve to form boundaries by separating groups of people whose identities are defined by the groups in power to safeguard their position of privilege. As sociological ideas, these concepts have changed over time and are not fixed. Although racism now is seen as discrimination directed mainly at non-white people, this was not always the case. For example, Eastern Europeans were subjected to racism in Canada at the turn of the 20th century because they were seen as being of a different race and ethnicity by Anglo-Saxon settlers (Ghosh and Galcynski, 2014). Viewing whites as one racial group is a recent phenomenon, and Banks (1995) points out that in the 19th and early 20th centuries in North America some white races were considered superior

to others. The classifications of race, ethnicity, gender, and class have no relevance either as a basis for assignment of rights or as grounds for prejudice and discrimination. They indicate changing power and social relations (for example, women did not always have the right to vote). They are inherently political, because they veil domination and exclusion, these classifications are symbolic of some form of underlying power struggle (Goldberg, 1992). They are also ideological because they provide the basis for action (Buchignani, 1980). Most importantly, these classifications impact identity development and the life chances of individuals and groups. As globalization and other factors impact diversity across the globe, hierarchies based on perceived differences of race, ethnicity, gender, and class continue to develop and fluctuate.

Diversity

Statistics indicate that there is tremendous mixing of the world's population. The plurality of human identities makes human beings "diversely different" (Sen, 2006, p. xiv). Globalization, wars, and natural disasters have caused large scale demographic shifts, thus increasing diversity in societies. Data on international migration shows increase in the last five decades: there were 281 million international migrants in the world in 2020 with Europe and Asia hosting 87 and 86 million respectively and North America 59 million (IOM, 2022). Of these, North America and Europe added 16% and 12% international migrants to their total populations but Asia and Europe took in the largest numbers (IOM, 2022). United States has been the main country of destination for international migrants since 1970 while India is now the largest country of origin. More than 40% of international migrants worldwide were from six countries in Asia in 2020.

Societies are now recognized to be diverse in multiple ways. Diversity implies variety but it means different things to different people, such as ideas, characteristics, values, or other factors. Demographic diversity usually suggests differences in ethnicity, culture, socio-economic status, gender, religion, language, and sexual identity and preference. Demographic diversity mainly results from the global movement of people across national borders. Immigrants have tended to concentrate in a shrinking pool of prime destination countries. Czaika and de Haas offer several reasons for this despite the globalization of migration; certain countries, for example, favor skilled or wealthy groups reflecting the "asymmetric nature of globalization processes in general" (2015, p. 319). With aging populations and rapidly declining birthrates in countries of the Global North, the need for skilled and non-skilled labor is met through immigration and refugee resettlements. Many of these countries have changed their criteria for selection of immigrants which were based on race/ethnicity and country of origin to a focus on skills and education so that immigrants are arriving from non-Western cultures and belong to religions other than Christianity (Ghosh and Abdi, 2013). In addition to immigrants, 26 million refugees worldwide, all from countries of the Global South, are fleeing war, violence, persecution, food shortages and climate change. Although 85% refugees are hosted in countries of the Global South, including Turkey, Jordan, Lebanon, Sudan, Pakistan, and others, many are also going to countries of the Global North. Germany is host to the largest number of refugees among countries of the Global North and countries assisting in the resettlement of refugees include the USA, Canada, the UK, France, and Norway, among others (Moutafis, n.d.).

As such, the global movement of people in homogenous societies have made them increasingly complex. With immigration from other European, later Asian, African and Latin American nations, countries in the Global North have become more and more diverse in ethnicity and culture, religion, language and socio-economic status in addition to contemporary recognition of gender (cisgender and LGBTQ+) identities. So, *super-diversity* (Vertovec, 2007) implies more than a focus simply on ethnicity and culture not only due to the variety of categories but also because of the complex intersection of differences in social class, gender, religion, language, etc. which result in very different experiences for any one individual or group. Differences in people's localities (historical, global) and positionalities (race, gender, language, religion, class, sexual orientation) influence diversity because where and how a person is situated in a society leads him or her to live through a particular set of experiences and to encounter distinctive power relations (Ghosh, 2019).

Identity

Human development is influenced by the context and the socio-cultural experiences of people for the growth of moral, social, emotional, and cognitive capacities. Although there are numerous studies of child and adolescent development in many non-western countries, they are usually based on western theories (Bansal, 2022). Indigenous models of development such as the Brahmanical-Hindu world view in India, Bansal points out, takes "a largely upper caste ... male centric view" (p. 42) and does not reflect the experiences of most people such as women and those who belong to other castes or those outside the caste system.

A fundamental characteristic that makes us human is our continuous search to understand who we are as individuals, what we want, what we may become. Who am I? Identity is a constructed sense of self. It is a subjective sense of oneself influenced by personal characteristics which are significant for an individual. It is who I am, my individuality. That is individual identity. Collective identity is how individuals define themselves as belonging to a group based on markers such as race, ethnicity, culture, gender, socio-economic class, religion, dis/ability etc. From the psychological perspective, individual identity refers to a person's self-concept: how I see myself in terms of the markers of difference, my attributes (self-image), how much I value myself and how I think others see me (self-esteem). Among many social identity theories, Tajfel and Turner (2001) see self-concept made up of two essential parts: personal identity (what makes one unique) and social identity (belonging to groups).

The drive for identity is a fundamental human need. Identity is extremely complex. Although we tend to identify ourselves mostly in terms of our physical characteristics (e.g., race/ethnicity), biological (sex), social (e.g., socio economic class/caste), and cultural relations (influenced by our history and social/economic conditions), we have multiple affiliations and identities. Moreover, our identities are not fixed but are influenced by our social realities which are changing. How others identify us is also complex because those shape how we identify ourselves. Self-concept and identity are formed through social interactions and social distance because of how others perceive us and how we see ourselves in relation to our history, culture, class, gender, etc.

In his influential essay, *The Politics of Recognition* (1994), political philosopher Charles Taylor points out: “Identity is partly shaped by recognition or its absence, often by the misrecognition of others ... Non-recognition or misrecognition can inflict harm, can be a form of oppression, imprisoning someone in a false, distorted, and reduced mode of being” (p. 75). As a social-psychological construct, identity is shaped by those around us, with media and technology, through government policy, our histories, and cultural expression.

In his seminal work on identity, Hall (1991) points out that difference and identity are not given; they are produced in relationship with one another. One’s identity is constructed only in relationship with another. Difference is also produced in relationship with another. Since one’s identity is defined through difference, the question then is how difference is linked to power and how it is produced and reproduced.

Post-colonial discourse disputes that there is any culture that is pure or essential. The word ‘hybridity’ borrowed from biology, where it indicates the merger of two genetic streams, had a negative connotation in colonial times. In post-colonial discourse, however, it connotes the bridging of two or more cultures. In a globalized world “all forms of culture are continually in a process of hybridity” (Rutherford, 1990, p. 211). The cosmopolitan hybrid identity is positioned not in any one culture but in a third space to include the other in a transcultural, cosmopolitan situation. Attributed to Bhabha (1994), this postcolonial theory of identity suggests that the hybrid third space is an ambivalent site where cultural meaning and representation are not fixed. By being positioned in the juxtaposition of cultures the hybrid identity can mediate between many cultures to translate and negotiate difference.

Identity is the basis of discrimination because racism, sexism, and homophobia for example, are built on differences from the norm, which is based on the characteristics of the group in power, and how people are identified in terms of race, gender, or sexual identity in comparison to that norm. Everyone has multiple identities, and these identities intersect in complex ways. Although Kimberlé Crenshaw (1989) drew attention to how social identities are configured by intersecting issues of power and oppression in the context of legal studies, it was not till a decade later in 2000 that intersectionality became an analytical lens to investigate discrimination in the social sciences. The dynamics of intersecting layers of multiple identities captures the complexity of identities by acknowledging the reality of people’s experiences, especially those who are subjected to multiple forms of oppression (McCall, 2005).

Identity crisis

Perhaps the most profound impact on individual and collective identities has been caused by colonialism. Briefly, colonization by European countries in Asia, Latin America and Africa had a very negative impact on the identity of people of the colonized countries by instilling a sense of shame and inferiority in them vis-à-vis the white colonizer. Fanon (1952) describes how the inferiority complex is internalized by the colonized through the creation of a false identity in the hope that imitating the white colonizer would give them equality, while their true identities remain hidden behind the white masks. Like Fanon, Rabindranath Tagore, in India, was more concerned about the deformation of the mind and Indian identity due to colonial education than he was about colonial rule (Ghosh et al., 2010).

Similarly, in settler colonial countries the Indigenous populations faced the same denigration of their cultures. In some cases, as in Canada and the US, the attempt was to wipe out the Indigenous identities of children through residential schools where students were subjected to extreme sexual and physical violence. But while the colonial project led to mimicry (Bhabha, 1994), or imitation of the colonizer and created a false identity in the colonized, settler colonialism forced assimilation on Indigenous people in an attempt to kill their cultural identity.

In post-colonial societies, the problem of coloniality (the identities associated with European domination) persists despite the end of colonial rule. However, in the settler colonial countries, the challenge is also the settler identity. For example, in Canada, the English population has become very diluted due to immigration. There are complexities in the “Canadian” identity which is further complicated by the French province of Quebec which has asserted its own identity through the assertion of the French language. While ideologically, Canada has created a social and national identity through its Multicultural Policy (1971) to unite its population, tensions remain with Quebec and Indigenous groups.

In postcolonial countries like India, as in other South, Southeast and East Asian countries which are collectivist societies, identity development takes place amid contradictions of tradition and modernity, traditional values and modern values, parochial culture and cosmopolitan culture, family and peer group that create confusion and inner conflict about individual’s identities (Bansal, 2022). Urban youth have access to technologies and a range of social media, consumer goods and “guiltless indulgence” and are identified by brand names (Bansal, 2022, p. 49). They are exposed to a number of alternatives and what Bansal calls “enterprise culture” (p. 50) characterized by confidence, initiative, and risk-taking. Rural youth (the majority) and low caste groups who are poor are aware how their poverty is excluding them from the opportunities offered by globalization. They experience a diminished sense of self-worth, and develop a negative identity (lazy, angry, violent delinquent) to resolve a crisis an identity (Bansal, 2022).

Children who experience caste discrimination grow up with a “stigmatized identity” (Thorat, 1979, p. 74), and yearn for equal treatment.

Identity crises are also caused by globalization, technological advances, and natural disasters when individuals and groups attempt to make sense of rapid changes and try to figure out who they are. The latest crisis is the COVID-19 pandemic and its variants which have brought a feeling of uncertainty and helplessness causing many people to question their identity and re-evaluate their life's path. This is an identity crisis.

With the announcement of a public health emergency by the World Health Organization, countries around the globe hurriedly took aggressive measures to curb the spread of the virus: lockdowns, social distancing and isolation, refusing visitation to loved ones who were dying in large numbers in hospitals, canceled events, closed institutions including schools, colleges, universities, offices and businesses, all have challenged our identities. But these measures had very different impact on the populations of different countries. The virus has infected people indiscriminately and different countries dealt with their situations very differently. In India, for example, 1.38 billion people were locked down within 4 h “The lockdown to enforce physical distancing had resulted in the opposite—physical compression on an unthinkable scale ... the poor are sealed into cramped quarters in slums and shanties” (Roy, 2020, para. 29). In contrast, “... the wealthy and middle classes enclosed themselves in gated colonies” (Roy, 2020, para. 22). The marginalized were more affected due to lack of resources and inability to safely distance themselves even in the most affluent countries. In the US, for example, while overwhelmed hospitals and overworked medical staff dealt with lack of equipment and chaos the majority of deaths due to COVID-19 were people living in poorer and more urban counties (Holmes Finch and Hernández Finch, 2020). In individualistic cultures, such as the US, media reports indicated that a sizable number of people refused to get vaccinated whereas in many poor countries in Africa vaccines were in short supply.

Collective identity—social relations with others—is challenged when isolation and social distancing cause depression and other mental health issues. The experiences are quite different for people working in urban areas in secondary (e.g., manufacturing), tertiary (e.g., service industries) and quaternary (e.g., technology and scientific fields) sectors from those in the primary sector (e.g., agriculture). Individual identity is challenged when people spend all their time at home. When individuals are constantly close to family and working from home, they start to re-evaluate their lives. In countries like Canada and US, with the disruption in normal routines obliging people to spend time alone and bringing them face to face with mortality through media reports of alarming number of deaths, loss of friends and relatives has made people ask existential questions about what is important in their lives, their goals, and priorities. As the economy and educational institutions reopen, there is a shortage of people in several service area jobs because some people are not returning to their jobs according to media reports. In countries of the South, the majority of the population is in the primary sector, and they have fallen into greater debt and poverty. For example, the havoc caused by the pandemic is expected to double India's poverty in which the rural areas are most affected (Ram and Yadav, 2021).

The global increase in rates of domestic violence, and the urgent need to focus on mental health and well-being in adults and children, both result from identity crises. Although our identities change through our daily interactions throughout our lives, the pandemic has forced us to break with the past because it has touched every area of our lives, all our identities. The vaccine has brought some normalcy, but the new normal will be very different. We will need to rebuild our identities. It will mean that the vaccinated will have the privilege to live safely by following strict regulations but know that responsibilities are part of the deal. Those who challenge the regulations, for example, by refusing to wear a mask, have difficulty coping with the challenge to their identities, unable to acknowledge that the world has changed, that their lives will no longer be the same.

COVID-19 has had a tremendous effect on education, both good and bad. Everywhere, educational institutions had to be closed suddenly and the business of educating students led educators all over the globe to resort to online learning. The delivery of education has changed dramatically. Instant communication and social media affect the way we communicate and impact the way we develop our identities. The various online teaching platforms enabled instruction when it was essential to stay at home. Yet, losing the opportunity to be close to others in a regular classroom affects the relational aspect of identity development and this is worse when some people do not show their faces when they are online. Privacy issues prevent asking students to show their faces in an online class, and by neglecting to identify their presence much is lost in student-teacher relations. While online delivery was the only option for at least a year, with educational institutions gradually opening to face-to-face instruction the new normal will have blended and hybrid modes of delivery. In this too, the marginalized suffer due to lack of computers and bandwidth, not only in economically poor countries where even electricity is sometimes lacking, but also in rural and poor neighborhoods in affluent countries where internet reception may be problematic, and bandwidth is not enough for several activities such as video conferencing.

Technology has had unprecedented significance during the pandemic, particularly in education. Technology affects the way people communicate at every level and therefore impacts the way people form their identities, both individual and collective. The pandemic has underlined the significance of social cohesion and collaboration in an interdependent world and drawn attention in education to the need for student and teacher well-being and care through a focus on individual identity and compassion for the other (Ghosh, 2022). This focus on student and teacher well-being and mental health, and to importance of social and emotional learning (SEL) is a positive outcome of the pandemic. There was a remarkable increase in collaborative webinars during the pandemic. The increase in educational reach to students who would otherwise not be able to participate, (especially in countries of the Global South and in rural and remote areas in the Global North) is a very good outcome. There was also an immense increase in online programs, platforms, and teaching methods to improve online teaching.

Education's role in the construction of identity in a diverse world

The socialization of children takes place through formal as well as informal means. Many countries, both in the geographical North and the South, have universal education through the efforts of the United Nations and its member countries that follow Education for All—EFA, Millennium Development Goals (MDG) and Sustainable Development Goals (SDG) (UNESCO, 1990; United Nations, 2015a,b). This implies that in most countries young people spend at least 10 years of their lives in schools. During the developmental age children seek to uncover their own identity, form a world view, bolster their self-confidence and search for meaning in their lives. So, the school (formal education) is an important place where identity is formed.

Education is a complex concept and is a double-edged sword. It can be used to promote positive individual identity development and thus positive self-esteem, but it can also have negative effects on identity development of children and youth who then develop low self-esteem. Education's role can be significant in the learning process because the beliefs, values, and feelings transmitted through the curricula, school environment, and classroom interactions shape the construction of each person's identity and self-concept. These values involve the whole community, teachers, administrators, parents, and others. Ideally, the community strives to provide a safe space for students and a sense of empowerment, as well as to develop critical understanding of how social relations are maintained through interaction with others (Ghosh, 2021).

As countries become more diverse, the diversity in society is reflected in schools resulting in discrimination, hate, and violence based on how students are identified. Education plays an important role in the development of racial, cultural, ethnic and gender identities (DeCuir-Gunby, 2009). Discrimination based on race, for example as in the US, exerts a profound effect on youth and children's identity development, their health, and lived experiences because, "Racial-ethnic identity is a multidimensional construct" (Svetaz et al., 2020, p. 310). While identities are constructed from the earliest stages of a child's life, Svetaz and colleagues point out that identity development is a key component of adolescence when a sense of self is crystalized (2020, p. 310). Even when racism and other forms of discrimination are not explicit, "implicit bias is a critical factor contributing to disparities" (Svetaz et al., 2020, p. 315) such as trauma. Moreover, positive well-being is an important predictor of school success (Dyrbye et al., 2006) and poor mental health can cause negative feelings about one's identity such as exclusion (Knauss et al., 2015) or the experience of a threat (Nelson, 2009) resulting in poor performance in school.

Most Western countries (such as US, Canada, Australia) are increasingly diverse in terms of culture, religion, and language in addition to existing socio-economic and gender divisions. Education can be an equalizing force, but it can also perpetuate inequities for those whose identities are marginalized due to discrimination and non-recognition so that they become disengaged (Ghosh et al., 2016). In modern democratic societies, the challenge to schools and teachers is to provide fair and equitable learning opportunities and experiences to diverse student populations that enable them to participate fully in society. This is especially difficult in cultures which have had assimilationist policies and now need inclusive, critical multicultural policies which are radically different. So, the need to deal equitably with students who are different in ethnicity, culture, language, religion becomes imperative. The shift from assimilation into the host society to multicultural and inclusive education involving space for other cultural identities is a paradigm shift. In European countries, the US, Canada, Australia, and New Zealand, the inclusion of non-Western identities—in terms of race/ethnicity, culture, religion, language—can cause nationalistic sentiments giving rise to hate and violence against groups seen as the "other".

In many countries of the Global South, like those in South Asia, different challenges such as unprecedented demand for education, intense competition, high attrition, and generally low-quality education cause tensions in educational opportunities and impact the identities of those who are underemployed and unemployed among large sections of both educated and uneducated people. In the school system, socio-economic class, gender, caste, religion, and physical/mental challenges are markers of difference which exclude children. These inequities exist both in the Global North and South but are larger in scale in the South and therefore, more critical.

Students who don't feel their identities are validated by the curriculum and school environment can become disengaged and are often marginalized. They may withdraw from participating actively in school or even get drawn to anti-social activities like joining gangs, getting involved in violence, and on occasion engaging in extremism to find validation when morally disengaged. Mental health problems not only make school experiences difficult but can lead to self-injury and even suicide. Some root causes that can trigger an individual to disengage or turn to violence are alienation, marginalization, insult or misrecognition of one's individual or collective identity, a search for validation, and the failure to understand the historical development of discrimination and other global inequalities.

What can education do? The concept of education has changed from a process of transferring knowledge from the teacher to the student (teacher-centered), to learning as the construction of knowledge by the student (student-centered). Education that involves the construction and dissemination of knowledge and values through dialogue is likely to encourage students to develop positive identities because it allows for the freedom to question, negotiate and relate one's personal experiences to the learned concepts. On the other hand, education in which knowledge is transmitted to learners through practices such as rote learning implies lack of opportunity to question or challenge ideas and develop individual identities.

Educational content and process should focus on the validation of the cultural, social, and gender differences of students and the development of their individual identities. Education can attempt to combat extremist behavior through developing values and understanding, but educational strategies are long term and aim to accomplish long-lasting objectives. It is not only the content that is taught which should reflect the diversity of the students, but the attitude of the classroom teacher as well as that of the school

administration toward students that are not from the dominant group whether it is in terms of race/ethnicity, culture, gender, socio-economic class, religion or ability.

Teachers' impact on identity development

Verhoeven et al. (2019) conducted a literature review to examine the role of schools in adolescents' identity development. Although this review of 111 studies looked only at studies published in journals in the Global North, it still gives insight into school's impact on identity development. Their findings indicated that while a stable identity is important for being resilient, reflective, and autonomous in making important life decisions with a sense of competence, this was becoming more challenging due to individualization, emancipation, and migration. By introducing new ideas, activities, and possibilities in school, teachers can help adolescents to explore the identity implications. The results of Verhoeven and colleagues literature review show that:

- (1) teachers may unintentionally affect students' identity development through the hidden curriculum. This happens through (a) selection processes for various school activities and differentiation such as grouping students. For example, the identity exploration of high-status groups are positive about their future, whereas those in lower groups are fearful of who they might become; (b) teacher strategies unintentionally inform students' identity development; (c) teacher expectations are very significant, and teachers tend to have expectations based on ethnicity and gender. So, certain groups of students may experience different opportunities which have a positive or negative impact on their identity development; (d) peer norms also affect identity development especially when some identity positions are stigmatized.
- (2) Teachers can foster identity development organizing Explorative Learning Experiences in which intentional and planned learning experiences are offered. (a) In-Breadth Exploration or exposure to on-site, hands-on unfamiliar learning experiences and content allow students to try out new identity positions and new interests as well as identify new talents; (b) In-Depth Exploration enables students to delve deep into their subjects of interest and on-site, hands-on experiences such as meeting with role models encourage them to develop a keen interest in making identity commitments. This is particularly important for STEM subjects (c) Reflective Exploration through reading and discussing topics of interest to students whereby dialogue could lead them to search for a balance in their dreams and societal expectations.

What programs exist to negotiate difference? Marsden (2017) identifies three academic approaches: the moral, social justice, and rights-based approaches. There has been rapid development in programs and courses to deal with the challenge of diversity in schools. Multicultural/intercultural/diversity and inclusive education, values education, human rights concepts, and anti-racist education increasingly permeate the curriculum. Human rights and citizenship education, social justice-based education, and values education can provide a foundation for recognizing the dignity and rights of human beings. However, if they are focused on abstract ideas of rights and values without relating student experiences to the complex social, economic, and political issues, if they are not embedded in the curriculum through an ethics of care (Noddings, 2013), students might develop "tolerance" for the other from a superior and superficial point of view rather than a caring way of relating to others. Nel Noddings' (2013) theory of an ethics of care focuses on an education based on compassion and care in relationships. Caring relationships focus on developing people as caring and relational, which plays a crucial role in developing a person's identity. What is essential is the development of relational and critical thinking. Focus on the relational aspect of human identity is important in schools since identity is formed through relationships. Jackson's (1997, 2004) interpretive approach incorporates dialogical methods, critical pedagogy, and cooperative learning with a focus on the importance of students' experiences, the context, and the curriculum. This approach helps students situate their identities through a comprehensive understanding of the complex issues related to their lives (Ghosh et al., 2016). Multiple perspectives are crucial because the failure to explore various interpretations could prevent students from engaging critically with absolute claims to truth and what is good. The interpretive approach has significant implications for teacher education programs.

In traditional educational contexts, teaching methods such as lecturing and rote learning that discourage student participation and critical thinking work against developing engaged citizens. That is why using ineffective pedagogical methods to teach social justice issues does not have the desired effect of promoting social inclusion and building on students' identities. Education programs can inadvertently close minds if they are uncritical in nature and feed into existing biases and prejudices.

With the shift in the conception of Multicultural Education from a liberal perspective to Critical Multicultural Pedagogy, the focus has moved from folklore, cultural preservation, and prejudice reduction strategies to inclusion of the identities (representing the diversity of society), anti-discrimination (such as racism) and such democratic values as equality, fairness, and inclusion. The structural barriers in society and school stifle students' identities due to the social constructions of race and gender, religion, and physical/intellectual challenges. These inequalities are intergenerational and not only affect their identities but also their identity aspirations and life chances.

Critical Multicultural pedagogy aims to develop an understanding of oppressive structures through critical examination of colonialism, slavery, imperialism, and globalization which have created the current social and economic inequalities globally (Ghosh, 2022). It also looks at contributions of various cultures (including indigenous cultures) and civilizations to the development of science and technology. The focus is on the development of critical consciousness of oneself and of others. It incorporates social and emotional aspects of learning with cognitive aspects of learning and being. The idea is to help develop students' individual identities with critical thinking for social consciousness of rights and responsibilities in society and the world we live in. Most

importantly, the negative effects of unequal treatment and the benefits of social justice and diversity affect all, not only the other (Ghosh, 2022). Critical Multicultural Education (CME) is a worldview that should permeate the curriculum in all subjects.

Dominated by a neo-liberal ideology and the commodification of education as a result of globalization, the instrumentalist form of education has obscured identification with humanistic values of compassion, an ethics of care, collective rights, human dignity, and worth. The focus of this form of education is on development of work skills and training, rather than critical thinking and global citizenship values such as human rights, social justice, interdependence, intercultural communication and social cohesion. Economic and technological skills are essential for living, but cognitive skills and social and emotional skills can also be developed alongside those in schools. What makes education different from training are the long lasting human values it instills. These skills are important for good citizenship if we seek a future which is less unequal.

The pandemic has shown that inequality in the world is not only a moral issue; it is an economic issue, an environmental issue and most importantly, an educational issue. Online learning is not accessible for those who suffer from poverty and homelessness, for those who live in many countries of the South and in remote areas of countries of the North, and for those who are physically challenged and marginalized.

Implications for teacher education

Recognition and inclusion are fundamental to human dignity. To have a truly inclusive classroom in which each student is validated, recognized, and feels cared for as well as challenged means understanding difference through a critical multicultural, anti-racist, and social justice perspective. The change from an assimilationist system of teaching and learning to an inclusive and critical multicultural perspective implies a paradigm shift in teacher education programs, a total reversal of one's worldview.

The pandemic can be a turning point for educational institutions to reinvent their pedagogies and structures. We have the opportunity in this defining moment to reconceptualize the content and methods of teaching but most of all, we need a dramatic change in worldview. The need is a philosophical rethinking and reconstruction, a new, inclusive world view that permeates all courses and activities in teacher education programs. To validate identities and provide students the opportunity to develop strong identities teachers must themselves develop a critical consciousness, take multiple perspectives, provoke students to challenge the dominant norm, and disrupt the way knowledge is processed. It is of course imperative for teachers to be introspective and examine their own ways of thinking, their biases and prejudices, and reflect on their own worldviews before they facilitate students in examining their beliefs. This is no easy task; nor is it packaged in a course. It is a way of thinking, a philosophy of life and of teaching. Pre-service and in-service teachers need to develop critical thinking and a critical awareness of how they teach. Teachers need to see the importance of global interdependence, the complexity as well as the potential of diversity, and the necessity of encouraging students to express their identities and experiences to make lessons more relevant to students' lives in a student-centered philosophy of teaching (Ghosh, 2019).

Inclusive classrooms imply making all students feel that they are part of the classroom, the school, and the society to avoid the varied effects of alienation, marginalization, and isolation (Ghosh, 2019). Teachers who deal with children from different ethnic/race, class, gender, religious, language, sexual orientations and physical or mental challenges must aspire to provide equal educational opportunities to all children irrespective of their social category. They cannot be fair to all students by ignoring their difference (e.g., being color-blind) because society is not color-blind; it privileges certain ethnic groups. It is fairness, not blindness to differences or color blindness, that is a fundamental principle of justice (Appiah, 1992). Fairness is not equal treatment but equity or equality of opportunity: it is to recognize difference without allowing it to categorize people (Ghosh and Galczynski, 2014).

Conclusion

One of the purposes of education is to enable citizens to develop strong identities to prevent and counter any action that stifles human dignity. Schools play a significant role in the construction of children's identity. Self-concept and identity are formed through social interactions and social distance as a result of how others perceive them and how they see themselves in relation to their history, culture, class, gender, etc. Identity construction has tremendous implications for educational success because it is related to self-esteem, empowerment, school achievement, and ultimately to one's life chances. Multiple diversities make identity development complex. Davies (2009) suggests the encouragement of hybrid identities so that children can see themselves as unique and distinctive with a variety of identities.

In these deeply controversial times, amid contradictory discourses, the pandemic has forced us to collectively question our identities. Face to face with an invisible enemy which is attacking people indiscriminately and devastating the most vulnerable, we are together questioning all aspects of what used to be. One of the most far-reaching global catastrophes of our time has provided an opportunity to recreate our collective identity as one human race and re-envision a world that is less divisive and more humane with less inequality, poverty, discrimination, and violence for a sustainable and peaceful planet.

"White woman" as an ideal type: the conceptual framework of racial abuse as a gendered project	94
Historical construction of white woman as ideal type	96
Historical archetype meets present day	98
References	101

The US and other parts of the world are experiencing a racial upheaval. During former US president Trump's run up to the election and the following 4 years as president, the US nation felt the racial divide perhaps only comparable in recent memory to the Nixon era. Before that, we may have to recall the Civil War. For many people, Trump's rise conjured up an old America that he and his supporters wanted to recapture, emblazoned on red MAGA hats to "Make America Great Again." His performance of toxic masculinity, curtsying to white nationalism, and exhibition of personal narcissism were difficult to miss, even to the casual observer who may or may not have voted for him.

However, a key ingredient to the formation of the New or Alt-Right is the participation of white women, without whom it would be facile to pin the upheaval on Trump, despite that he may wish for that. Pointing out a couple instances should suffice for now. White women's vote for Trump lagged behind their vote for Hillary Clinton but not as significantly as would have been predicted for the first woman presidential candidate. The appointment of several white women to important posts in Trump's administration enabled Trump to construct a Rightist (some call neo-fascist) regime that reached across the gender aisle. This included Secretary of Education, Betsy DeVos of the famous Michigan billionaire family at the head of Amway company. Last, on January 6, 2021, just two weeks before the handover of power to President-elect Joe Biden and Vice President-elect Kamala Harris, the first Black and South Asian woman to hold that title, the Capitol insurrectionists stormed congress to try to stop the process of officially counting the electoral votes that would eventually seal Trump's fate as a one-term president. At that siege, there were many white women, including those who breached the Capitol building and Ashli Babbitt, the young veteran woman who was fatally shot in a skirmish with a Capitol police officer (Barry et al., 2021).

In more "mundane" instances, the white woman phenomenon, dubbed "Karen," makes the headlines when white women summon the authorities to criminalize otherwise harmless behavior from Blacks. "Karen" is a stereotyped white woman with passive-aggressive tendencies. For example, holding an outdoor barbeque, like an incident at Oakland, CA's Lake Merritt, prompts a white woman to file a complaint with the police department (Wood, 2019). In another incident, Amy Cooper reported a "threatening" Black man, Christian Cooper, who requested that she leash her dog in Central Park, NY. Amy Cooper has since publicly apologized, faced legal charges for falsely accusing Christian Cooper, fired from her job at an insurance company, and a mental illness defense for her racist rant was been launched (Nir, 2020). The Cooper episode happened in the middle of the Black Lives Matter (BLM) Movement and the public recognition that Black men stand the chance of being killed by police officers for countless non-violent offenses, as with the case of George Floyd who wrote a bad check and was dead by the end of the day. For that matter, Black people are accused of non-offenses, as with a white woman who accused a Black teenager of stealing her cell phone in a hotel where the young man and his father were staying. Naively, which should not be confused with innocently, hailing the police is a deadly decision, weaponized by Amy Cooper and other white women who seek the protection of the racialized nation state and its racial apparatuses, including its repressive forms (see Leonardo, 2005, 2015).

It should not be lost on the reader that Amy Cooper's "insanity defense" fits two profiles. One, it reinforces an older idea of racism as evidence of an irrational mind, rather than part of whites' rational and racial interests. Two, it deploys a patriarchal image of women as hysterical or emotional to the point of madness. Of course, we may simply excuse the entire defense as self-serving and convenient, which may be the case. But consistent with our tack in this chapter, we emphasize Amy Cooper and her precursors' racialized and gendered history, like Carolyn Bryant who was directly responsible for Emmett Till's lynching. In a cruel twist of fate, Bryant has since confessed that certain parts of her accusations of Till were false (Tyson, 2017). A little too late.

As it concerns Cooper's mental incapacity defense, it may work to soften the vitriol she received since the Central Park episode, but she is diminished by her association with being insane. A white man using a similar escape hatch is more difficult to imagine, perhaps only as a last-ditch effort, because a racial patriarch is assumed to be rational even when he is racist. Although admittedly from a different era, Carolyn Bryant's husband, Roy Bryant, Emmett Till's murderer, would not have admitted to the madness of his behavior. It was considered a rational response to a perceived racial threat. On the other hand, Amy Cooper may be dismissed by the casual observer as an irrational, hysterical woman. This political trade may preserve her racial advantage but subverts her gender interests as a member of the "second sex" (de Beauvoir, 2009/1949). This brief portrait of white women's participation in race

projects happens in the backdrop of a patriarchal system that asks for their loyalty to whiteness. It serves as the poignant example of the compromises an injured group makes with whiteness in exchange for a modicum of protection from the injuries they face as a targeted group within other social relations, like gender, or class, as with the white working class. As this chapter points out, this imperfect union does not ameliorate, but rather deepens, white women's real and perceived injuries.

Education is acknowledged as a racial project on one hand, or a gender project on the other. Both lines of research have a long-standing presence in educational research and the disparities we find in each relation is remedied by suggestions around anti-racism and anti-sexism in schools, respectively. However, for the most part their engagement has remained separate from each other. Powerful explanations exist (see Crenshaw, 1991; Hooks, 1984; Collins, 2009; Pateman and Mills, 2007; Villenas, 2010; Coloma, 2012) but they have not been able to shift the general rule that race and gender analyses are developed independently of each other within education research. As a result, educational scholars lack a robust framework for understanding racialized sexism or sexualized racism as points of intersection in order to arrive at a more complete picture of subordination as it concerns students of color of any gender. For example, Critical Race Theory (henceforth CRT) in education has advanced an elegant empirical and theoretical study that favors race and subsumes a study of gender within the general predicament of racialization. Said another way, CRT in education is first and foremost a race intervention. On the other hand, feminist work in education has long been weak at addressing racial subordination in exchange for a singular attention to gender with the occasional synthesis with either race or class. With gender as primordial, race-evasive analysis constructs race as somebody else's problem, usually people of color.

Recent research in education has begun to focus on the fact that the vast majority of teachers are white, most of them being white women. This relatively well-known data point has not spurred on a concerted effort to understand the particularities of what white women bring to the raced and gendered dimensions of social life, considered as entangled within the educational enterprise. However, this bundled analysis is becoming more difficult to neglect, especially as educators predict that students of color soon will become the majority population in public schools. Said another way, more students of color will be taught by a majority white woman teaching population. With white women at the helm of most classrooms, racism does not appear general or ungendered, but arguably in a feminine form (see Leonardo and Boas, 2013, 2022; Leonardo and Gamez-Djokic, 2019; Miller and Lensmire, 2021). Although they do not call the shots in a patriarchal system, white women sometimes pull the racial trigger.

We submit the thesis that a feminized or euphemized form of racism exists in schools. White women teachers' interactions with students of color necessitate a deeper look at, or a critical theory of, the ideal type in classrooms: "white woman." Admittedly, there are different ways to be a white woman, but our task is to understand what has continued and continues to structure this educational archetype, including the role that it has played historically in how students of color experience education. As we show, white women occupy a contradictory position as both oppressor and oppressed, abuser and abused, injurer and injured. In other words, white women are targets of sexism and patriarchy even as they embody white privilege and enact racism in education. This double role is not a controversial claim but points out that an appropriate understanding of white women's place in education needs to account for both dynamics of their subordination by gender and superordination by race. We weave several lines of thought to support this analysis. In particular, we draw on historical scholarship on whiteness to overview the construction of the white woman teacher ideal type as well as critical race and intersectional scholarship, which offer insights into the contemporary structures of teaching linked to this ideal type. Additionally, and foremost, we leverage Thandeka's (2000) book, *Learning to be White*, for its generative framework of "white racial abuse," which we explain in the next section.

"White woman" as an ideal type: the conceptual framework of racial abuse as a gendered project

Few publications in the last several years have been more provocative than Reverend Thandeka's someday to be classic text, *Learning to be White*. Although it is more common and commonsensical to regard people of color as the actual victims of racial abuse, Thandeka inverts the analysis to suggest that the process of becoming white takes the form of abuse, in both the clinical and symbolic sense. At first glance, this innovation is provocative yet counter-intuitive, for it suggests a first or primary racial injury, which occurs in the psycho-social development of a child who transforms from a human to white child through cultural, psychological violence. Bearing the marks of a universal human, not unlike other children, the white child begins the narrowing process that negates their universality in exchange for the mythical status of becoming white. This is different from other forms of specificity that all humans experience as they enter an ethnic, a cultural, or national milieu, a process that integrates them into those formations, admittedly having their own set of problems. However, for the child who becomes white, they must go through *dis-integration*. Their core sense of self undergoes a fragmentation, and they sacrifice self-love for group loyalty to whiteness, treason to which either incurs more abuse or excommunication from the only community they have known thus far. Throughout the many stages of development from childhood to adulthood, being white is akin to picking up the shards of identity leftover from the broken mirror of whiteness. In modern terms, whites assume the tragic figure that would dwarf the fallen heroes in Homeric poems.

As part of partaking in whiteness, whites sacrifice human essentials, such as unconditional love from caretakers, freedom from emotional abuse, and curiosity about the other. Overall, becoming white is a process of negation and separation, sedimented in the human subject in what Thandeka calls white racial shame, or *shame*, plainly speaking. Opposite the assumption that whiteness cultivates a narcissistic self-love at the cost of loathing nonwhite others, or *blancophilogenesis* (see Leonardo, 2015), Thandeka shifts our

understanding of whiteness as *prima facie* evidence of a fundamental self-hate. In fact, in one of Thandeka's case studies of Podhoretz, a Jewish man struggling with his second-class status as a "facsimile white," Thandeka writes, "In this skewed scenario, the Negro anti-Semite becomes a mask: the blackface of Podhoretz's own white shame. His rage against the Negro masks his own white shame (or his own Jewish anti-Semitism) by making it unrecognizable" (p. 33). The convenient reasoning is that as a non-WASP, Podhoretz shields anti-semitism with feelings of anti-blackness, from which Thandeka departs by suggesting that it is instead a lifelong *intra*racial struggle within whiteness projected onto Black people. Rather than a victorious moment, becoming white is a collection of moments of defeat experienced by the child, usually perpetrated by their caretakers who should also be understood as victims of having become white. It is triumphalistic at best. This arrested development continues well into adulthood, that is, unless whites experience another upheaval, this time anti-racist.

Our main purpose in this section is, first, to introduce and interpret Thandeka's abuse framework, and second, to illuminate what appears to be an underdeveloped gender dimension to her framework. White racial abuse is a psycho-social explanation of white development at the hands of caretakers. Although it is reasonable to assume that Thandeka uses caretakers in a broad sense that includes family, teachers, the social welfare system, even one's government, the primary unit of care remains the family. Here, Thandeka does not offer care (or its cognate, love) as only a positive practice, desire, or principle. By care, she means a relation that one enters whereby a caretaker, such as parents or guardians, provides for or protects the cared-for, in this case children (concerning whites of any age, we may say they are children of the white nation). This caring act is not an unconditional good and when race enters the picture, may qualify as its very opposite: violence (cf. [Leonardo and Porter, 2010](#)). Contrary to traditional race understanding, Thandeka reinterprets the newly inducted white person as racial violence's primary target, its first victim.

There are other moments in history when claims to caring for others resulted in violence. Colonialism is one such case, or when European powers claimed to save natives from themselves by caring for their soul in the form of religious conversion (see [Coloma, 2012](#)). Caring for native souls arguably represents the highest form of concern for others, if you follow the colonizer's rationale. The logical outcome of colonial care, at least to colonizers, is gaining salvation in God's kingdom. Religious conversion and other colonial events in history happen through masculine coercion but they just as often transact through feminine persuasion, imperial western women being the favored agent of colonialism's kinder and softer form. Education was often a central, feminine mechanism of this process ([Jacobs, 2009](#)), which we discuss more fully in the following section. In short, caring becomes the primary cultural role of women, mothers, nuns, and in the case of contemporary, public education, white women teachers. Again, this does not mean that white women somehow "control" the process, because they are under the surveilling eyes of the patriarchal gaze. Thus, a caring framework is more convincing and complete when a gender component is integrated into it, something to which education is not a stranger (see [Noddings, 1984](#); [Beck, 1992](#); [Valenzuela, 1999](#)). Appropriating Thandeka's elegant framework for education necessitates integrating a gender analysis to the assertion of white racial abuse and the shame that accompanies it for the specificities of studying what [Althusser \(1971\)](#) once called the educational ideological state apparatus (ISA), reframed as a racialized ideological state apparatus (RISA) (see [Leonardo, 2005](#)) or the educational racial contract (ERC) (see [Leonardo, 2013; 2015](#)).

But there is more to it. If taken literally, then caring's ironic, violent consequences are somehow associated with white women, the primary caretakers of white children, both in the family and schools. As victims of structural gender abuse, women are targets of patriarchal violence and therefore enter the process of racial abuse as double subjects: the *abused abuser*. Any accounting for their role in caring for or raising white children includes accounting for their subjective reduction as the "caring gender" within structural, patriarchal relations. This move does not deny their part and participation in racism. On the contrary, white women, in this case teachers, must reflect on their racial compromise with whiteness, the privileges of which compensate for their gender injury by perpetrating a different kind of violence, this time directed at people of color of any gender. To Thandeka, the original abuse and the ensuing sense of being under perpetual siege or attack experienced by white humans, explains their tragic inability to understand their racial predicament. To this, we add that, in schools, understanding white women teachers' racial development is simultaneously an accounting for their gendered participation in the racial army.

To be clear, caring here should be understood as an empty signifier with a neutral status, that is, until it is filled with a political project. This is not unlike the dialectics of violence one finds in Fanon's *The Wretched of the Earth*, where violence possesses a cleansing effect, partly in its ability to inject a sense of self-respect in Black natives who become *actional* humans through the catharsis of anti-colonial violence (see [Fanon, 2005](#); for an explanation on the dialectics of violence, see [Leonardo and Porter, 2010](#)). Likewise, with respect to race history, caring is not the fuzzy, warm feeling that humans normally understand by or associate with that term. In other words, as an empty category, caring may be paired with racism, as was the case during colonization when nuns and priests "cared" for the natives' soul. Likewise, when filled with a white supremacist project, caring within the white family, schools, neighborhoods facilitates the subjective transformation of human beings into white people, which is an assault on their core sense of self. Racialized caring relation is the beginning of a lifelong process of feminized racial violence that most whites are ill-equipped to understand when they repress what it means to have undergone said transformation. White children's first and last teacher is the mother figure by virtue of a sexual contract in place ([Pateman, 1988](#)), which relegates women to the role of mothering, even if not all women are in fact mothers.

Like classical abuse, white racial injury is assimilated into the white child's psyche as a confusing set of orientations to self and others. And like such abuse, the abused often becomes an abuser of others as the cycle repeats itself if more humans are to become white, generation after generation. Focusing on childhood memories has been key to even a popular cultural understanding of psychology and psycho-therapy, so formative childhood development is for the adult that humans eventually become, racial or

otherwise. For white adults, who comprised Thandeka's participants, childhood memories of becoming white were ghostly and haunting. This racial remembering is responsible for the deep shame that follows whites well into adulthood. But their white memories were evident and Thandeka needed only to scratch the racial surface in order to elicit stories and emotions, ranging from white lessons over dinner table conversations, bringing home a Black friend, running into Black people on the street, a Black family moving into the neighborhood, or the arguably worst of all taboos, interracial dating. This means that the "white pride" calling that far Right groups use to recruit members is not that ironic, if we consider that white humiliation is part of becoming white.

Of all these emotions, Thandeka elevates the feeling of *shame* as one of the most debilitating feelings that whites experience. It is a stain that whites carry with them basically all of their life, a burdened or heavy feeling that something about the self they have become is not quite right. Its social version is felt as embarrassment because whereas it is quite natural to share childhood memories with friends or strangers, white racial memories, as recollections of abuse, come with (1) a sense of sinful confession (2) distress from potential judgment and (3) evidence of their unlovability and (4) fear of exile from one's community (on white exile, see also Leonardo, 2020). Wanting integration, they fear further disintegration; desiring connection, they are paralyzed by separation anxiety but fulfill it as the only way they have known in order to survive; craving authenticity, whites give up the reality principle for a mystical understanding of the racial world. Or as Thandeka distinguishes, feelings of guilt are evidence that one has done something wrong, whereas shame is the acknowledgment that one is fundamentally wrong.

With all of these emotions in play, it is not surprising that many of Thandeka's white respondents end up in tears. However, she reminds us that they weep not primarily because they feel shame over their ostensible racism toward people of color but over whites' own fragmentation. Theirs are not mere crocodile tears, but represent the fundamental loss associated with becoming white. Of course, white loss is a conflictual phrase since to people of color, the loss is more accurately called a *trade*, and a trade up at that. In other words, whites traded their ethnicity and language for social promotion to whiteness; for many people of color, including immigrants, such a loss simply amounts to a demotion since they received no white dividends at the end of the process. The former is a sign of shame, the latter a sham. This fact notwithstanding, white trade comes with structural value, so it comes as no surprise that it is coveted by previously non-white subjects even as it exacts its cost and demands its pound of white flesh. This is where Thandeka departs from Du Bois' (1935/1998) phrase and later Roediger's (1991) appropriation of "wages of whiteness," or the public and psychological advantages of being or perceived as white. Consistent with Thandeka's framework that stresses the cost of becoming white, Thandeka pivots from a different preposition in what she calls "wages *for* whiteness" (p. 79; italics in original). This deceptively simple prepositional replacement is replete with meaning, such that it emphasizes the cost of becoming white for the person who is abused into whiteness. Whereas "wages" is more often interpreted as the financial dividends like salaries, it may also take on a second meaning as it evokes the internal war that a white person wages by becoming white, a storm that rages in their fractured identity (see Levine-Rasky, 2016).

Teachers are often referred to as *in loco parentis* (see Dreeben, 1968) insofar as they take on the role of surrogate parents for the youth. More to our point, because most teachers are white women, they more accurately assume the specific role of *in loco mater* in public schools. This means that their *idealized* reproductive role in the nuclear family as mothers extends from the dinner chairs to the classroom seats. Their racialized emotional labor, or care, makes them central figures in the lives of both white and nonwhite children. As it concerns the former, the racial abuse that white children experience goes well beyond the private and includes the public sphere. As an extension of the matriarchal figure in white children's intimate lives, white women teachers continue the shame of whiteness that children carry, the disappointing of which would lead to a thousand small deaths in millions of small humans. In order to understand more fully the toll that racial abuse takes on white women and the children they teach, it is necessary to excavate the history that produced them as subjects, which is our task in the following section.

Historical construction of white woman as ideal type

In this section, we examine the racialized and gendered ideologies of the white woman archetype and their articulation with structures of teaching in order to examine the contemporary education landscape. Like other work on the historical construction of whiteness, Thandeka explores the classed compromises and costs involved in "the right to be white" (p. 87) and tangentially notes the subjugated position of white women. Although Thandeka focuses on the system of white racial abuse used to exploit the white working class, we illuminate the insights her framework might offer for a gendered analysis of whiteness.

Thandeka draws from legal race scholars to map the historical construction of and the socialization into whiteness. Keeping her focus ultimately on the psycho-social rather than the material, Thandeka argues that law constructs whiteness, and race more broadly, by concretizing abstract ideas and beliefs through a system of discriminatory laws, whereby material differences across racial identities are created and then maintained. As these laws create walls between racial groups, they also abuse lower status whites into a psychological allegiance to the elite, offering not protection but rather a restraint on the amount abuse one faces. While Thandeka develops a historical overview on the racial compromise of working-class whites (read: men), with caution not to flatten dynamics of class and gender into replica relations of power, here we develop we want to further develop this historical analysis in relation to gender and the racial compromises white women enter.

White women's legal identity was always constructed through their relationship with men and their rights and privileges through their gendered participation in the white racial army. Understanding the gendered and sexual politics of race laws created and used by white elite men, illuminates how white women have been produced as disintegrated subjects and socialized into the archetype of the abused abuser, at times through their explicit inclusion and at times through their absence. For example, in the fifty-two

prerequisite cases on racial differentiation leading up to the US Supreme Court cases of *Ozawa* and *Thind*, the judiciary logic never engages or names any women (Lopez, 2006). In *White by Law*, Lopez (2006) acknowledges this absence of women as evidence of the context that doubly restricted white women "as individuals and less than individuals (that is, as wives)" (p. 34). In other words, white women's whiteness became legally constructed not through their independent whiteness, but through their dependent relationship with white men (see also Mohanram, 2007). Yet, white womanhood and ideologies of femininity have been explicitly intertwined with the legal construction of race since the early US colonial laws. Thandeka notes how America's naturalization laws, which until 1931 automatically stripped white women of her US citizenship when marrying a "nonwhite" noncitizen, offer an example of how "a white is created by law" (p. 85) and how whiteness is a legal object (Harris, 1993) that may be gained and lost. In the 1600s, Maryland and Virginia made it illegal for whites and Black people to marry. Bans against interracial partnership along with the matrilineal inherited status of children functioned to restrict and regulate white women's intimate relationships, police and punish Black men, and legitimate and legalize the rape of enslaved Black women. With westward expansion, the US government broadened marriage restrictions to other non-white groups beyond Blacks, like Filipinos.

Entangled with ideas of the innocence and purity of whiteness, these laws codified gendered ideologies of race and racialized ideologies of gender. In the process, white women were defined as the symbolic opposite of Black women (Collins, 2009; Lugones, 1994). White innocence (Dyer, 1997; Painter, 2010), simultaneously gendered, cast white women as pure, at risk of corruption, or fallen victims, directly relying on the foil of Black women as strong, queer, and/or jezebels. In addition, Black men were constructed as criminal or contagion, such as the myth of the Black male rapist (Davis, 1990; Wells-Barnett, 1900). Gendered racism afforded white men a more self-righteous morality and constructed its complementarity in the form of a white "damsel in distress," needing a white male savior for protection and justifying violence against Black men. Repression and violence against indigenous people were carried out under a similar justification: to protect white women against threats of "Indian depredations" (Jacobs, 2009, p. 22).

Although governed by laws they did not themselves create, white women throughout history have worked on both sides of racism: participating in and being against it. In other words, the racial compromise white women strike with whiteness today is not new. Recent historical scholarship refutes conceptions that white women have been passive bystanders to racial violence and reveals the ways they worked for and found power within whiteness, not *despite* their gendered position in whiteness but precisely *because* of it. For example, Jones-Rogers (2019) documents various legal and extra-legal ways white women successfully wielded power to profit from slavery in the American South, despite, and at times because of, their lower gender status position, what Stepan (1986) calls the "lower race" of gender" (p. 264). In addition to full participation in the brutalities of the slave market, white women capitalized on specific feminine forms of participation in slavery, including making and regulating the market of wet nursing and the motherly duty of socializing white children into future positions of racial power. But again, whiteness exacts its moral price and white women give up profound parts of becoming human in exchange for becoming white humans. As noted, whereas Du Bois and Roediger prefer to describe this process as the accumulation of privilege, captured above by the "wages of whiteness," Thandeka (2000) turns the proposition on a different preposition with "wages for whiteness." Whites gain material wealth through whiteness, but they lose something not wholly insignificant (or more significant, depending on one's perspective). They kill their spirit, in the process. More than a pound of flesh, losing a kilo of soul turns whites into incomplete and sometimes empty receptacles. Although they may think such material wealth justifies the means, whites are the poorer for it.

This feminized participation in race projects has frequently been intertwined with schooling, both in the socialization or care-taking of children into whiteness and in the violence directed at nonwhite others. Starting in the late 1880s, Jacobs observes that "progressive" white women leveraged their gendered-racialized subjectivities as "better mothers" and morally superior caretakers at a political and interpersonal level to advocate for indigenous child removal, Indian Boarding school enrollment, and ultimately land dispossession across the United States and Australia. Twentieth century imperial feminism in the Philippines similarly forged openings for gendered authority in schooling as a mechanism for "civilization" through mixed claims of motherly benevolence and need to discipline people of color and/or indigenous peoples (Coloma, 2012). Similarly, the expansion of Common Schools in the States structured racialized-gendered ideologies and invested them with the white woman archetype of the "good teacher" (see Broderick and Leonardo on the problem of "goodness," 2016). As Common Schools expanded across the US during the 90th century in part as a way to "control," "save," and "civilize" poor not-yet-white, immigrant youth and freed Black children, white women quickly became the ideal teacher as they supplied a cheaper source of labor than their male counterparts, assumed inherently to work better with small children, and facilitated men's move into more "respectable" positions of administration and leadership (Apple, 1988; Kaestle, 1983; Tyack, 1974).

Yet, this expansion of white women's reproductive work to include the school, did not alleviate their gender injury. Despite these desirable traits, white women teachers still held a troubled position. Stereotypes that reinforced ideas of white women as caring, nurturing mothers also positioned them as weaker, non-rational actors (Ehrenreich, 2002). White women were regarded as limited in their capacity, never in full control, and needing a more rational male principal or superintendent overseer, particularly in the upper grades. Women politically active in teacher organizing were seen as a threat to the social order, departing from their core characteristics of submissive, self-sacrificing, and pious, therefore dangerous to the school system and unable to care for children (D'Amico, 2017). This gendered-racial occupational history solidified into ideas of professionalism in teaching, which mirror forms of managerial control more than the professionalism of autonomy, expertise, and status frequent in white-male-dominated industries, undergirding teacher-blaming discourses in contemporary reforms (D'Amico Pawlewicz, 2020). In short, as teaching became known as a white woman's profession, notions of professionalism were in turn restricted and always partial due to the gendered composition of teachers.

This historical white feminization of teaching structured racialized-gendered ideas of “good teaching” ultimately produced the white woman as the ideal teacher archetype, well positioned to carry out racialized care’s violent work. Understandings of “good” teaching and “good” teachers (see [Ladson-Billings, 2009](#)), as well as the structures that accompany these ideas, both produce white woman as key actors within the racialized ideological state apparatus of schooling and shapes the exclusion and displacement of Black teachers. Against the white woman norm, substantiating the work of Black teachers was deemed disruptive. For example, following the desegregation of schools post-*Brown v. Board of Education*, the authority and positioning of Black educators was challenged when white parents deemed them unfit to teach their children. Strategic federal, state, and local policies across the US in the years following contributed to Black teachers’ massive, forced pushout from the profession even when they were better educated than white counterparts ([Fultz, 2004](#); [Tillman, 2004](#); [Walker, 2001](#)). Many of those who stayed in teaching entered hostile environments that did not recognize or validate their expertise. For many Black children this meant an interruption in an epistemology of teaching whereby good teaching was previously rooted in deep pedagogical and political commitment to the community.

On the other hand, considering the histories of white women in the Civil Rights Movement illuminates limitations and contradictions of white women’s anti-racist efforts given the compromises they enter and make with whiteness. Most white women and their social organizations involved with the civil rights movement were described as far from radical ([Evans, 1979](#); [Laville, 2017](#); [Little, 2009](#); [Newman, 1999](#); [Olson, 2001](#); [Schultz, 2001](#)). They were often recruited through religious or campus organizations understood as an extension of moral or religious gendered care work, and not necessarily political. Frequently with more status, wealth, and relationship privileges to lose than their Black counterparts, most white women’s participation was what Irons calls “low-risk institutional activism” (1998, p. 698). Although Irons speaks specifically about women in Mississippi, we can draw from this to attend to the contradictions in anti-racism from doubly positioned white women.

This limited or low-risk participation allowed white women a sense of contribution to the movement while not risking their economic, social, or political positions. As [Little \(2009\)](#) and [Evans \(1979\)](#) note, moderate or even conservative institutions became instruments against white supremacy and a space for developing radical consciousness and practice against racism and sexism for some white women. Furthermore, despite frequently functioning at the peripheries of Black organizing, white women’s greatest tool, or their influence within their white familial, social, and religious spheres, was noteworthy in the larger movement. However, while white women’s low-risk anti-racism may have strained or even challenged some relationships, it frequently sought to maintain the modicum of protection afforded to them by whiteness, often through white men’s patronage (thus, the phenomenon of “Karen” has a longer history than we acknowledge). As Irons documents, when their husbands faced backlash or social pressures at work due to white women’s involvement, many women stepped down from highly scrutinized efforts and adopted less public roles in the work, sensing their “internal nonwhite zone... under siege” ([Thandeka, 2000](#), p. 23). In other words, white women’s loyalty to whiteness comes with the cost of a double alienation from an authentic relationship with one’s truer self and with non-white others, “where impulses to community with persons beyond the pale are slaughtered” ([Thandeka, 2000](#), p. 24). While relationships with Black women were tentative at best and troubled at worst, many white women and their social organizations still expressed beliefs of racialized authority and/or struggled with their organizational histories of segregation even if they expressed desires to overcome them.

Rejecting missionary activism rooted in ideas of Lady Bountiful or fair play segregationist stances, a small number of white women embraced a more radical mission and stance. Rooted in deep interracial friendships and accountability, activist training, and intraracial networks of support, their work was frequently in the background, such as raising money, creating platforms, and recruiting within white communities to support Black-led organizations ([Olson, 2001](#); [Schultz, 2001](#)). The involvement of these more radical women came with labels of social deviance as “race traitors” and “communists,” with real personal, physical, and financial risk. These experiences may even invoke feelings of shame as white women who develop race consciousness must confront their own complicity. [Thandeka \(2000\)](#) explains, “The experience of shame is thus a negative self-exposure, a revelation of forbidden desires. The self exposed is incongruous with itself. It is seen as who it is not supposed to be. It feels what it is not supposed to feel. It is aware of what it is not supposed to know ... Shame acts as a kind of Check-point Charlie” (pp. 13–27). White shame is a constitutive part of becoming and being white, most intensely felt when white women, in this case, become at odds with their whiteness as they establish solidarity with people of color. Although scholars have argued that white women’s radical race consciousness created a unique threat for whiteness because of the pretenses of protecting white womanhood to justify racial violence (see [Tyson, 2000](#)), at the heart of these white women’s effectiveness was a deep participation in the work, networks, and leadership of Black folks and a revocation of group loyalty to whiteness. In other words, this work upends individualistic notions of care and instead roots care in a political stance and radical accountability.

Historical archetype meets present day

In the preceding sections, we provided a conceptual understanding of white womanhood through Thandeka’s framework of racial abuse, specifically white women as *abused abusers*. Next, we traced the history of policies, practices, and ideologies that incorporated white women in the patriarchal-white supremacist project and the unique role they played in its structure. In this final section, we examine the white woman as an archetypal positioning within contemporary education, blurring the

line, or perhaps tracing the lineage from how things were and how things are now. We draw on critical race and intersectional scholarship to evidence of the evolution and persistence of racialized-gendered ideologies and structures of an abused-abuser ideal type in contemporary patterns and accounts of teaching. While the gendered nature of teaching as “women’s work” still shapes the structures of deprofessionalization in teaching, we can also connect lines of how public-school teaching continues to keep racialized “others” out and care for white women, instructionally and affectively, even within career conditions of constraint.

First, while our focus in this section centers around contemporary structures and ideals that protect and position white women’s race work, a double analysis also acknowledges the contemporary structural mechanisms of sexism and patriarchy within the gendered profession of education, and the compromised position of teachers today. Recent education reforms have ushered a focus on standardization, regulation, and marketization that further disempower teachers. Across competing reforms, there has been an anti-union trend and a loss of union-bargained agreements within a larger context of disinvestment and austerity (Horsford et al., 2019). As standardized testing takes on more focus and higher stakes, teachers’ work is more controlled, narrowly quantified, and deskilled. The most recent and profound inequalities that have been exacerbated through the Coronavirus Pandemic, among other dynamics, serve as a powerful reminder that women are still more easily pushed out of the workforce, burdened with expectations of and exploitation through their reproductive labor (Federici, 2014).

Within race and gender-neutral policies and structures, strong evidence of the white woman archetype endures. There are several ways this archetype endures instructionally, or how white women receive disproportionate care as it relates to their instructional recruitment, retainment evaluation, and assignment. Following the pattern of Black teacher displacement post *Brown v. Board*, as discussed above, recent years reflect a similar dismissal of the expertise of teachers of color, albeit shrouded through a race-evasive logic in a neoliberal era (Scott, 2011). The massive firing and loss of bargaining power of veteran Black teachers in New Orleans post Hurricane Katrina, and the subsequent replacement by a majority-white, novice teaching force through state partnerships with organizations like Teach for America (TFA), provide perhaps the most obvious example (Buras, 2016). In New Orleans Parish Public prior to the storm, Black teachers made up 73% of teachers in 2004–2005, nearly mirroring student demographics. Post-Katrina, that number decreased by 71% the first full year following, and by 2014, Black teachers made up less than half the teaching body (Cook and Dixon, 2013). Rather than a mournful loss of professional and community expertise, for many policy leaders and reform advocates, the devastation from Katrina was viewed as an unprecedented opportunity for education redesign through characterization (Anderson and Dixon, 2016). A similar combined prioritization of education market logics and low cultural valuation of Black teachers has been traced to the declining Black teacher percentages in other cities such as Chicago, D.C., and Philadelphia (Delpit, 2012; White, 2016).

These patterns suggest the culture of community, place-based expertise, and racial justice activism frequently descriptive of veteran Black teacher, evade dominant understandings of what characteristics make a good teacher across the United States. In pursuit of market-based educational reform and increased performance on standardized tests, they are disregarded. The pervasive narrative found within the recruitment logic of programs like TFA, is that good teachers should be selected and recruited from the “best and the brightest” (Milner and Howard, 2013, p. 537) at predominantly elite, white and middle/upper-class institutions, even if they are not going to remain in the teaching profession (Trujillo et al., 2017). In addition to recruiting within predominantly white spaces, these narratives and the practices connected with them also narrow the scope of “good teaching” to prioritize particular forms of knowledge, such as curriculum or subject-based knowledge, and enable a more short-term or contract-based workforce. While these recruiting approaches may not have a particular gendered focus, their efforts align with the larger deprofessionalizing reforms shaped by the gendered roots of the profession.

Likewise, although widespread contemporary discourse, including from TFA, has acknowledged the need for more teachers of color, these calls do not necessitate a challenge to the positioning of the white woman archetype. While there is a robust and important body of work about the effectiveness and importance of teachers of color, calling for more teachers of color is not always connected to broader efforts toward racial justice (Philip and Brown, 2020). Isolated or simplified calls for more teachers of color can act as a “symbolic buffer” (White, 2016, p. 5) or discursive alibi for institutions and/or leaders, limiting redress of racial violence or transformative change. While TFA boasts a more racially diverse corps membership since shifting recruitment approaches in recent years, there is less evidence that such changes will address the relationship of their diversifying corps demographic to the realities that teachers of color face either more broadly or specific to the region of their placement. Across these accounts, shared lip service to and even action driven agreement around the need for more teachers of color has not required challenging racialized-gendered structures and ideologies of “good teaching” that constructed and undergird the white woman ideal type.

Even in traditional certification routes, teachers of color face persistent structural barriers across the stages of a teaching career. Read another way, white women are still disproportionately cared for within these structures that are still designed for them in their double role. Within a marginalized profession, white women do not face the same discrimination and barriers toward certification and once in the profession encountered by teachers (candidates) of color (Petchauer et al., 2018; Rogers-Ard et al., 2012; Sleeter, 2017). Like other academic arenas governed by standardized tests and “neutral” evaluation protocols, certification exams are plagued by exclusionary white, Eurocentric norms and standards, and reviews of portfolios are subject to reviewer racial bias.

In addition to shaping working environment and school culture, the white woman ideal type endures in teaching practices, structures, and evaluation. Substantial research has documented the cultural bias in teacher performance assessment. Presented as race-evasive and the universal standard, ideas of “good teaching” and “best practices” continue to be grounded on unnamed white-feminized scripts and norms (Acosta, 2019; Endo, 2019). This does not mean individual white women teachers are in charge of the process. But over time as this arrangement plays out, a gendered white systematization of “good” teaching functions as a diminished form of privilege across multiple systems for those that conform and are read as such. A brief digression into empirical literature offers evidence of the institutionalization of white feminine scripts and norms through locally determined systems of teacher evaluation (Campbell, 2020; Drake et al., 2019; Grissom and Loeb, 2017), national criteria for good teaching such as National Board for Professional Teaching Standards (Irvine and Fraser, 1998), federal indicators of “highly qualified teachers” (Acosta, 2019), in standardized performance assessments (Petchauer et al., 2018) and in hiring (D’amico et al., 2017). Like much policy constructed and implemented in this era, rarely is this overt. Rather, as norms and systems interact with one another they become solidified in particular privileges.

We offer two brief examples. First, recent evidence on the race gap in teacher performance finds that teachers’ observations scores fail to account for school and classroom context-specific factors resulting in disproportionate lower rankings of Black teachers (Steinberg and Sartain, 2020). Second, beginning to counter the paucity of research on education policy’s impact attentive to teachers’ multiple race-gender identities, Campbell (2020) presents compelling evidence that Black women teachers receive lower observation ratings across and within schools than their white women counterparts, even when accounting for effectiveness, and were twice as likely to be placed on punitive development plans. While this literature is relatively new, as analysis of race and gender still largely remain separate, this work underscores how ideas of good teaching and the accompanying structures (including certification, assignment, and evaluation) are anchored in a sociohistorical construction of teaching as white women’s work and grounded in the historical construction of white womanhood.

Furthermore, the white woman archetype affectively and organizationally shapes teaching assignments and training. As teachers enter the classroom for the first time, white women matching the archetype in their gendered and racial presentation are read as simply as a “new teacher,” their gendered-racial identity subsumed into the norm. What type of teacher they will become remains unknown, to be shaped by the individual, placement, and experiences. On the other hand, teachers of color frequently encounter preconceived, essentialist teaching roles, work that they are expected to conduct because of the color of their skin and their presumed predisposition to perform particular tasks. In these “pedagogical kind[s],” (Brown, 2012, p. 297) teachers’ of color subjectivities, pedagogies, and expectations have been constructed by white colleagues and systems prior to entering the classroom. For example, Black men are normalized as disciplinarians, their value dependent on their ability to govern Black boys and Latino men are asked to embody and signal a “corrective representation” of masculinity in their positions as representational role models (Brockenbrough, 2012; Singh, 2018).

Building off of Patricia Hill Collins’ work on the controlling images of Black women as Sapphire or Matriarch, Acosta (2019) describes how Black women teachers must fight widespread caricatures of superhero or bodyguard. These caricatures objectify Black women as the other and can lead to disproportionate work overload and the undermining of their effectiveness (see also Mensah, 2019). While much of this scholarship explores the unofficial ways in which these roles reproduce, scholarship on teacher sorting reveals that teachers of color are more likely to be assigned to lower-track classrooms than their white colleagues (Kalogrides et al., 2013). These pre-set roles undermine teachers of color’s professional expertise and frequently positions them to save or discipline students of color rather than lead or co-create rigorous learning environments. Scholarship on these pre-set roles also attend to how teachers of color are also called on to save their white women colleagues from students of color. While white women may be positioned as the “better mother,” colleagues of color are asked to step in and rescue white women from students that they deem hard to teach.

This affective rescuing of white women gets invoked not only in their instructional teaching roles from their students of color, but affectively in their professional development and learning spaces as well from their colleagues of color. Even as contemporary initiatives may strive to engage deliberately with race, across teacher education and teacher professional development, the protection of whiteness, and in turn white women, remains centered. Most multicultural teacher education courses “reflect White sensibilities” (Sleeter, 2017, p. 158) in their curricular content and pedagogical approach. Racial analyses in these teacher learning settings are commonly power-evasive and rarely lead to profound shifts in teacher beliefs or practice. Much like the institutional or discursive alibi of calling for more teachers of color sans a structural change, such power-evasive trainings can blunt broader racial justice efforts and even reify institutional norms. Candidates and teachers may learn about race or racism, but white standards, identities, and communities remain intact.

Ultimately, structures of whiteness and race-gendered privileges are maintained. Even teacher trainings that take a structural approach to racial justice struggle to shift beyond prioritizing white women’s emotional needs, sensitivities, and consciousness (Kohli, 2016; Matias, 2016). Within these spaces, a plethora of accounts tell the story of a white woman feeling uncomfortable with the discussion of racial injustice, sometimes breaking down in tears and leaving the conversation, whether physically exiting or by shifting the focus and content of the conversation to center their emotions. In this well-rehearsed scene, white women’s tears function as an affective technology of to reinforce the rationality and positioning of white men to come in and save them whiteness (Hook, 2005; Leonardo and Zembylas, 2013). The parallels to the earlier examples of Amy Cooper are not lost here, where racism takes on a feminine form of helplessness, this time not enacted against students but colleagues of color.

In this chapter, we argued for greater appreciation of the role and history of white women in education. As the majority of the US teaching force, white women represent the primary subjects in the enactment of whiteness with children of color. If it were as simple as that, we could stop short of a deeper analysis. As targets of patriarchal power, white women occupy a structural position with a profound sense of ambivalence. In short, they are abused abusers whose measure of racial power and privilege is compromised by their position in gender hierarchy. However, this dual position holds out the possibility that white women teachers may yet recognize their own injury and use it as a basis to fight against racial injustices by becoming “bad” white subjects, that is, by resisting the injuring of others. That this has not happened, by and large, speaks to the difficulties of transferring insights about one form of abuse to understanding another set of relations, the complications among diverse and sometimes divergent political interests, and the challenge of a more complete social analysis. In our own attempts, we tried to unveil the contradictions found in the archetype of the “white woman,” whose whiteness is both specific to the institution of schooling as it is currently structured and the place of white women within the evolution of whiteness.

The coronavirus (COVID-19) pandemic has exposed the fragility of the US economy and the immense power disparities and systemic disadvantages built into our social contract

(The Roosevelt Institute Covid-19 Response, 2020).

These are important first steps to colonizing space and other worlds. Humankind will explore and colonize our solar system and then reach for the stars
(The Gateway Foundation).

Writing and thinking about policy studies during a global pandemic, multiple occurrences of windstorms, earthquakes, fires, flooding, and extreme heat or cold disasters, amid racist attacks and continued murder of Black persons by police, social justice movements countered by extremist tactics, months of attempts by an acting US President to overthrow democratic elections and disrupt a peaceful transfer of power resulting in the January 6, 2021 insurrection at the US Capitol—all occurring in a chorus of loud actions and messages of hate, violence, and conspiracy theories—has been, to put it mildly, overwhelming. Any of these contexts would cause reflection and analysis. When these contexts are occurring simultaneously and intersectionally, ruptures in the infrastructure of U.S. democracy, economy, and access to basic necessities of everyday life (such as clean water, food, lodging) are exposed. These exposures and dichotomies have drawn direct attention to the “systemic disadvantages built into our social contract,” a social contract based on settler colonial logics, logics not limited to Earth.

These conditions have opened up conversations across progressive and mainstream institutions and puts questions about “Who are we? What do we expect from society, ourselves, and our institutions?” to the forefront of policy studies. That is to the forefront of the social values of society, to the roles of research, the policy process, policy actors, and discourse (Ball, 1993, 2015; Rizvi and Lingard, 2010). Initially, this chapter was titled “doing policy, differently.” However, after a pandemic + year of thinking about institutional to departmental level policy needs and possibilities, I suggest it is not always about doing things differently, racing toward the next in theory, ideas, or analytics, but often it is about doing our work deeply—attending to context, process, and using strong theory and analysis. Part of doing work deeply is reminding ourselves what policy studies is, as well as what are policy possibilities, and policy studies responsibilities/response-abilities. I present feminist genealogy as an informative approach to policy studies and spend the body of the paper discussing what feminist genealogy is and can do. This is policy studies written toward remembering and a commitment to decolonial reparations for present futures (Pillow, 2017a; Webb and Gulson, 2015).

A reminder of what policy studies is & can be

Policy studies encompasses analysis of the process of policymaking, that is, the policy process itself, as well as analysis of the contents and outcomes of policy. Social and education policy reflect social values, and as a field policy studies is influenced by a range of paradigms and methods. Across any approach, policy studies has theoretical, methodological, and practice responsibilities. From a critical, feminist, poststructurally influenced lens (Pillow, 2015, 2017b, 2019), some key points of responsibility include:

- policy is about social regulation; thus, we can examine who is being regulated, how, and why, and to what effects/affects
- policy can be a source of social change and we can examine change for the values of equity, equality, social justice, reparative transformation
- policy analysis can address social injustice and policy debts (Ladson-Billings, 2006; Pillow, 2017b)
- policy studies can be dedicated to a “widened range of policy possibilities” (Roosevelt Institute Covid-19 The Roosevelt Institute Covid-19 Response, 2020).

This is a way of thinking about policy studies wholistically—considering policy philosophically as well as applied and asking how definitions of policy problems and choice of methodologies impact the shape of policy discourse and enactments (Ball, 1994; Gale, 2001, 2003; Pillow, 2004). As a field, policy studies has a responsibility to know its own history. Asking for example: How have policies supported division and invoked harm and how has a policy studies theoretical and methodological arena reproduced inequities and limited policy possibilities. I argue that with the depth of excellent policy studies work (e.g., Ball, 1993; Gillborn and

Youde, 2000; Hawkesworth, 1994; Myers, 2002; Myers and Ha, 2019; Rizvi and Lingard, 2010; Stone, 1998), policy scholars and policy actors have a “response-ability.” That is we have the resources to be able to do policy differently. Thinking about policy studies as a field with theoretical and ethical responsibilities as well as a field with the ability to apply knowledge activates policy studies.

Toward this goal, the London School of Economics and Political Science (LSE) description of social policy is very useful (Platt, 2021):

Social policy is concerned with the ways societies across the world meet human needs for security, education, work, health and wellbeing. Social policy addresses how states and societies respond to global challenges of social, demographic and economic change, and of poverty, migration and globalisation. Social policy analyses the different roles of: national governments, the family, civil society, the market, and international organisations in providing services and support across the life course from childhood to old age. These services and support include child and family support, schooling and education, housing and neighbourhood renewal, income maintenance and poverty reduction, unemployment support and training, pensions, health and social care. Social policy aims to identify and find ways of reducing inequalities in access to services and support between social groups defined by socio-economic status, race, ethnicity, migration status, gender, sexual orientation, disability and age, and between countries. At LSE, social policy is explicitly *international, interdisciplinary and applied*.

Thinking with and enacting the LSE definition requires response-ability. The past three decades of policy studies scholarship have demonstrated that policy studies is compelling and provocative. Close investigations of epistemologies, ontologies, methodologies have provoked examination of how we ask questions, what approaches are engaged, and how we might differently engage knowing/seeing/witnessing (Pillow, 2019).

The above LSE definition summarizes where policy studies is. Policy studies is theorized as temporal—always addressing past, present, futures (Pillow, 2015). Policy studies is on the ground, embodied, lived experiences, and materialities. Policy is action, text, discourse; interactive and intra-active. Policy is simultaneously theoretical and applied. Policy studies methodology of the policy process itself and/or a focus on policy outcomes offers built in spaces for critical reflection and reflexivity. Given policy is a “reflection of social values” (Rizvi and Lingard, 2010), understanding and defining policy studies in these ways is crucial to developing policy studies as a field that demonstrates a response-ability to invoke social values.

Feminist genealogy as policy studies approach

Feminist genealogy arose from my thinking with poststructural feminisms, Women of Color (WOC) feminisms, and Michel Foucault. This approach was developed as a necessity. In the 1990s, education policy studies was closely indebted to quantitative supremacy and a “rational decision making” model of reasoning (Stone, 1998). Challenges from critical, feminist, poststructural thinking were just beginning to be discussed at conferences and published in essays and volumes (Ball, 1994; Marshall, 1997; St. Pierre and Pillow, 2000; Troyna, 1994). It was a decade-plus of heated debated, often referred to paradigm wars (Denzin and Lincoln, 2008). However scholars often presented in siloed spaces presenting to and talking with those mostly in paradigmatic agreement. Certainly spaces to think with like-minded critically engaged colleagues are necessary to produce excellent scholarship (and these spaces are crucial to BIPOC, queer, under-represented persons and scholarship), but at conferences I found myself running between postie sessions, policy sessions, and sessions deeply engaged with race or intersectional WOC theory. The postie sessions mostly ignored race and systemic colonialism and treated questions of either as simply identity critiques (Pillow, 2019); mainstream policy sessions avoided feminist, race, and poststructural thinking; and the race/queer/woc spaces provided provoking analysis and discussion that fed me personally and professionally.

Academia’s disciplinary structure—a structure that desires purity logics (Lugones, 1994)—discounts interdisciplinary scholar’s splintered experiences in courses, conferences, and publishing. Certainly this is changing with programs like LSE and the growth of interdisciplinary policy studies journals and publication outlets. Yet, policy studies as a field, and policy in development and implementation, is immersed in colonial logics leading to inherent systemic biases, including a centering of assumptive heterosexuality, normative gender binary, and whiteness. Given this basis, there is a responsibility to acknowledge that policy studies needs the theoretical insights and shifts, the analytic skills of WOC, race, and queer theory in order to produce policy studies that is not mired in its own white-out ontology (Pillow, 2019). Feminist genealogy is one way to approach this responsibility.

My first moves toward feminist genealogy were deeply influenced by feminist theories of the body and embodiment (Pillow, 1997). How does policy account for, think about the bodies it seeks to define, regulate, change, control, or access? How do these bodies experience policy? This two-pronged interest drove my curiosity about both the “inscriptive” and “lived body” (Grosz, 1995) and what would it require for policy studies to consider how it thinks about inscribed bodies as well as what it would look like to analyze policy from/with corporeality of lived bodies. My key interest was: “How does paying attention to bodies change what we look at, how we look, what we ask, and what we choose to represent?” (Pillow, 1997, p. 349).

This question and feminist genealogy’s theorizations and methodological explorations are indebted to the young mother’s I spent time with and learned from. Focusing on pregnant/mothering students access to K-12 education as an education and social/legal policy issue presented many challenges and ironies including assumptions amid absences and sexualizations amid

discomfort and silences, as well as deeply racialized good girl/bad girl discursive constructions reinforced in research, policy, practice, and social attitude. Turning to the body, I argued

... can work to make explicit what is both overexposed and obscured elsewhere. Both of the exposures presented point to the inability of our theories, practices, and programs to deal with certain bodies, in this case, the pregnant teen body.

Pillow (1997, p. 360).

My close observation of pregnant/mothering bodies in schools, demonstrated how bodies are defined, assumed, and treated and these lived experiences necessitated further understanding of how and why certain bodies are treated differently. It became clear that to understand what was occurring to deflect and limit pregnant/mothering students access to public education in the 1990s–2000s, required an understanding and analysis of socio-historical racialized constructions of “unwed mothers” and how these constructions prevail in present and future ideologies of who the pregnant/mother student is and thus, how she should be treated and what she deserves (or does not deserve). That is, how certain bodies are thought is linked to past constructions, which impact present and future possibilities.

Increasingly, I saw history as key to any policy study of the present, and by 2003, I introduced “feminist genealogy” as a policy studies methodology. Feminist genealogy incorporates qualitative and cultural history methodologies with close attention to bodies and at the time what I termed “race feminisms.”

Feminist genealogy builds from the work of Foucault read through and with race-feminisms and focuses specific attention upon the discursively structured raced, gendered and sexed body. Feminist genealogy embodies policy analysis, forefronting and refiguring conceptualizations of bodies, power and knowledge in policy studies.

Pillow (2003, p. 146).

While I introduced feminist genealogy as methodology, it was and is also a theoretical approach. Feminist genealogy offers ways of “doing” policy research and analysis—close meticulous observation of how power enacts on bodies combined with socio-historical analysis of how and why regulatory, discursive power defines bodies in certain ways—and simultaneously feminist genealogy is a way to interrogate policy studies itself; it offers a way to observe and critique for example assumptions involved in determining what is a policy problem or how a policy issue is defined or how to interpret policy data.

In these ways, feminist genealogy is a constant check and challenge on the policy studies scholar, requiring us to continually question our own assumptions. Feminist genealogy thus “reinterpret(s) power, truth, ontology and subjectivity”; offers an “historical, discursive critique” of “what appears natural and necessary”; while locating “the work of genealogy as critique within the body, a methodology that embodies policy analysis” (Pillow, 2003, p. 147).

Feminist genealogy acknowledges the embedded relationality between theory, research, and practice and is a way to undo policy studies while doing policy studies. As noted above, my turn to and development of feminist genealogy was due to lacks and gaps in policy studies; policy studies theories and approaches were actively working against what I was witnessing in public schools. While I continued to work on policy and legal change for pregnant/mothering students to access education in the US, feminist genealogy also allowed me to shift my lens of analysis from young mothers as the problem, to the arena of policy studies itself. Policy studies had a problem—theoretically and methodologically—and alongside other critical, race-feminist, poststructural work, I sought to actively shift how we think policy studies:

An embodiment exposed through feminist genealogy alters what is meant by policy studies. It opens spaces for questioning the construction of the policy process, now policy studies becomes in essence the subject of analysis and challenges analytic methodological practices. Embodied analysis provides a way to speak up and speak back to the paradoxes in existing policies and expose the ineffectiveness of reliance upon assumptive, seemingly natural.

Pillow (2003, p. 156).

Policy studies present futures

As an arena of study, policy studies has a responsibility to investigate itself as a field of knowledge, research, and practice and to expand how, who, and what is theorized and how and what research is authorized. I suggest that feminist genealogy is a useful approach toward these needs. Partly what feminist genealogy can do is identify how policy studies determines and enacts what matters—what bodies matter, what issues matter, what knowledge matters, what research matters—across decades.

As Trouillot (1995) asks: “If some events cannot be accepted even as they occur, how can they be assessed later? Can historical narratives convey plots that are unthinkable in the world within these narratives take place? How does one write a history of the impossible?” (p. 73). In this I hear a challenge for feminist genealogy, a challenge to both identify and see what is hegemonically unthinkable and to identify the processes, the plots, that reproduce the unthinkable. This requires as Freeman (2010) argues an affective temporal drag of data; “a way of forcing the present to touch its own disavowed past or seemingly outlandish possible

future" (p. 78). Data as "temporal drag" offsets past-present-future absences, while also creating a drag effect and affect on how data is thought, read, and discovered in observation, in data sets, or in the archive. I raise these points to highlight that feminist genealogy, like any approach, will reproduce what and how it is thought. Feminist genealogy is only as "good," is only as useful at analyses of power, as the theorizations and provocations it is thought with.

In early work, alongside feminist poststructural scholars, I often called for thinking otherwise. However, looking back I see how these "otherwise" calls could and often did simply reproduce existing standards and structures of power. Thinking otherwise assumed a "homogenous empty time" (Ferguson, 2007), assumed that there was not knowledge and theory available to undo the identified power arrangements (the colonial logics) when in fact there was a wealth of theorizing available to "think otherwise"—it was just that this work was not part of fem-postie theorizing and not authorized in those spaces. This is a reflective looking back, which is part of our work as scholars, and in this reflexivity I am not prescribing thinking with only certain critical theories. I am identifying a gap—an ontological white-out—in that heady insightful work produced in policy studies in 1990–2010, a gap that continues but does not need to be repeated.

As theorizing continues to be on the move, policy studies would benefit from increased interdisciplinary thinking—whether thinking with critical theories in humanities, physical sciences, earth sciences, geography, etc. In order for policy studies to theorize and analyze what decolonial otherwise spaces might be, the field will continuously need to address its ontological white-outs and for that policy scholars need the depth of critique and knowledge available in Women of Color, decolonial indigenous feminism, interdisciplinary Race theory, and Queer of Color critique (Magubane, 2016).

A policy studies committed to thinking otherwise requires specific deep engagement with postcolonial studies, decolonial feminisms, and indigenous critical theory and any and all theory that helps see ontological white-outs. The intention is to have "thinking otherwise" provoked into thinking approaches that have theoretical impetus while directly addressing materialities of social injustice. Here for example, thinking otherwise becomes reparational transformation, decolonial praxis, decoloniality (Byrd, 2016; Dharmoon, 2015; Figueroa, 2015). Policy studies—across theory, research, and in practice—has a primary role in addressing societal needs, including what decoloniality does, and what can decoloniality look like in policy studies? What are elements of decolonial policy in theory, research, and practice? What are processes of decolonial policy? Feminist genealogy with its close analysis of the present as indicative of the past while articulating potential futures is a useful way for policy studies to engage with decoloniality and decolonial futures. This work is not only a global issue but a cosmological, galactic issue as governments, entrepreneurial groups, and technologies readily deploy ontologies of "space colonization" relying on nationalistic colonial discourses and practices to dominate space including unknown worlds (<https://orbitalassembly.com/>; https://www.nasa.gov/centers/hq/library/find/bibliographies/space_colonization).

Whether and how feminist genealogy is thought and utilized is up to present and future scholars, but analyses of power is at its core and feminist genealogy is not about stagnant replications of critique. In addition, the impetus of feminist genealogy to necessarily think with feminist, race, queer+ studies because these lenses are needed in order to see and interrogate colonial logics is also at the core of feminist genealogy and I suggest necessary to policy studies. The ongoing challenges of recognizing and re-theorizing colonial logics and colonial white-outs is the responsibility and the response-ability of policy studies; a response-ability to past, present, and futures.

Introduction

Indigeneity, according to [Steeves \(2018\)](#), is not as simple as an opposition to identity erasure or resistance against colonization. Rather, Indigeneity is composed of many histories and experiences. This chapter does not attempt to define Indigeneity, but to discuss and explain Indigeneity in the contexts of relationships. As [Baird \(2016, p. 501\)](#) explains, Indigeneity does not mean the same to everyone. Rather, the particular social, cultural, political, and historical contexts of different places influence the ways in which “indigeneity is being conceptualized and practiced.” For example, [Grydehøj et al. \(2018, p. 17\)](#) speak to the notion of “Indigenous” and the challenges in avoiding labels and categories imposed by colonization. Therefore, the term Indigenous would not be used by everyone. Similarly, the idea of Indigeneity is going to be understood in different ways and contexts by some people.

The United Nation states that Indigenous peoples are inheritors and practitioners of unique cultures and ways of relating to people and to their environments. Despite colonial devastations, Indigenous people continue to retain social, cultural, economic, and political characteristics that are distinct ([United Nations, 2009](#)). Indigenous Peoples, while unique, share collective ancestral ties to their Lands and natural resources from which they often are, or have been, displaced. Their lands and resources are linked to their identities, cultures and livelihoods, as well as their physical and spiritual well-being ([World Bank, 2021](#)). Indigenous Peoples are currently 6.2% of the world’s population, and they come from all regions of the globe ([United Nations Development Programme, 2021](#)). [Steeves \(2018, para. 1\)](#), points out, “diverse Indigenous communities weave Indigeneity through a multifaceted array of space and time to revive identities and cultural practices and to regain or retain land, human rights, heritage, and political standing.” The Declaration on the Rights of Indigenous Peoples (2007) affirms, and reaffirms, the unique status, distinctiveness, rights, and protection of Indigenous peoples globally. Regardless of who Indigenous People are and where Indigenous People live, there are common bonds and understanding in the Indigenous worlds that unite them.

[Radcliffe \(2017, p. 221\)](#), describes Indigeneity as a cross-disciplinary concept. The author adds that “indigeneity refers at its broadest to the quality of being Indigenous. Indigeneity can be defined as the socio-spatial processes and practices whereby Indigenous People and places are determined as distinct (ontologically, epistemologically, culturally, in sovereignty, etc.) to dominant universals.” [Matute \(2021, p. 257\)](#) examines what it means to be Indigenous in a globalized world and looks at the power relations. Furthermore, the author contends that Indigenous peoples “display... a multiplicity of indigeneities, considering different interpretations and experiences. ...” [Jaffee and John \(2018, p. 1412\)](#) remind us that the term Indigenous was used by Indigenous peoples in their quest to be recognized within the United Nation. They assert that, although there are numerous Indigenous People who have different languages, cultures and come from many different places, Indigenous People “stress a connection to ancestral Lands and a non-Western ontology which frames their kinship languages” and the ways in which their societies are organized and structured. [Dei and Jaimungal \(2018, as cited in Dei, 2016, p. 61\)](#) reports there is general agreement that there are “contestations and contentions of Indigenous and Indigeneity”, and that “there is neither a singular category which encompasses Indigenous, nor Indigeneity.” Indigeneity is therefore “constantly being redefined and negotiated,” based on the power relations at work in particular moments and time ([Postero, 2013, p. 112](#)). This chapter draws on the work of Indigenous scholars and discusses Indigeneity in the context of relationships to Land, Connection to Indigenous ways of knowing through Education, and the Indigenous world-views of reciprocity.

Positionality on indigeneity

As a rural Island person from the Caribbean, and someone who identifies as Taino, I have always understood my Indigeneity even if it had been unspoken. Macintosh suggests that the enduring existence of Indigenous people in the Caribbean into the new millennium continues to challenge popular writing and standard scholarship ([McIntosh, 1999, para 3](#)). For example, generations of

people for the past five hundred or more years grew up hearing and believing that Taino people ceased to exist after first coming in contact with Europeans. This became normalized in school texts for hundreds of years, and Taino people remain invisible today. Yet many Indigenous people in the Caribbean continue to express their Indigeneity in their own ways. Grydehøj et al. (2018, p. 14) state, Island peoples “are re-engaging and reworking their self-determination, economies, identities and relations to their territories and to mainland and global society” There is a resurgence and a reassertion of Indigeneity in the Caribbean. This is just one example of that resurgence and what I describe as “singing it out loud.” Yet, as noted, there is no one single universal form of Indigeneity. Based on my lived experiences and knowledges in a Caribbean, and specifically Yamaye, context, I understand what it means to be Indigenous.

Raddcliffe (2018, p. 443) points to the impact of colonialism, and how power dynamics are encountered in the everyday lives of Indigenous peoples, and the ways in which Indigeneity is expressed socially and intersectionality ... My lived experiences inform my Indigeneity which was given to me by my ancestors. I think about the plants that provide nourishment, including Rosemary, leaf of life, countless tropical fruits, and my relationship to my ancestral lands. The land was constantly giving to us, to our family, and we in turn love the land. Growing up in a rural part of the Caribbean Island, Land was of utmost significance, and it remains that way today. The many plants, shrubs, and food vegetation that we get from the Land is at the foundation of Indigeneity, as is the red dirt, the soil that is part of the Land where I come from. Kimmerer (2018, p. 28) explains that “plants are also recognized as our oldest teachers” and adds that plants have been around for a long time. “They know how to make food and medicine out of light and air and then they give it away. They unite the earth and the sky and exemplify the virtues of generosity, providing us with all that we need to live.”

Bishop (2001, para 1) shares the following story which also grounds my understanding of an Indigenous world. She writes about listening to the story of an Elder from the Kalahari Desert in Botswana. The Elder shared stories “about the waving savannah grasses and the endless sky of his homeland and told me that he could never leave because the land knew him”. This resonates with me because not only does the land knows me, but the land remembers me.

The critical importance of Land is intrinsically understood in my family. The Land feeds us spiritually—so much so that even when away from the Land selling it is not an option. Rather, it is imperative to have someone care for and tend to it. I have lived the experience of learning from the Land and having that connection and relationship with it. For example, corn, casava, sweet potato and beans are only a few of the food systems in the context of subsistence living that reinforce my connection to my ancestral Lands. Our Taino ancestors had food sovereignty which they derived from their Lands. We continue to eat the food that our ancestors ate. Most of these foods, given to us by the Land, remain central sources of nourishment within the contemporary context despite the more than 500 years of colonial and imperial domination of our Lands and People. In the Islands, the food that comes from the earth sources provides for the community, which is a form of recognition that the Land gives to the people. Assing (2016, para 3) explains Caribbean peoples’ own Indigenous pre-Columbian ecology, including the forests and rivers, were teeming with more life than we know to exist today. Even the sea that separates these islands was full of food. Further, Bishop (2001, Para 2) notes how the Kalahari Elder’s statement about his ancestral Lands is, political, emotional, and philosophical. It is at the heart of Indigenous Peoples’ understanding of their world. Yet, Bishop (2001, Para 2), writes “Unfortunately, the depth of this belief for traditional Indigenous people has rarely been fully appreciated”.

To examine “what is Indigeneity?” Matute (2021, p. 261) writes that it is necessary to listen to the narratives, histories, perspectives, and horizons from those who live it. The next section of this chapter looks more indepth at Land and Indigenous principle of relationships to get a meaningful understanding of the significance of Land and its connection to Indigeneity.

Indigenous land knowledge and connections

As previously emphasized, Indigenous people throughout the world have their own worldviews and cultural practices. Nevertheless, many Indigenous people have been impacted by Land loss, dispossession, theft, and displacement. However, through Indigenous peoples’ interconnection and interrelatedness with their Lands, they have found ways to challenge Western thoughts and practices (Jaffee and John, 2018, p. 1410).

Raddcliffe (2017) observes that Land is also reflected in the understanding of Indigeneity and Indigenous Peoples’ spiritual and intimate relationship with their Lands. The United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP, 2007) Article 25 affirms Indigenous peoples’ right to

maintain and strengthen their distinctive spiritual relationship with their traditionally owned or otherwise occupied and used lands, territories, waters and coastal seas and other resources and to uphold their responsibilities to future generations in this regard.

The United Nations Department of Economic and Social Affairs (2009, p. 52) report on statement of the world’s Indigenous people reinforces the commonality in worldviews of Land to Indigenous peoples globally. It stated that *Land is the foundation of the lives and cultures of Indigenous peoples all over the world.*

Another example that demonstrates the wholistic relationship of Indigenous people with the Land is the work of [Restoule et al. \(2013\)](#) which discusses a research project that looks at “honoring Mushkegowuk Cree view of Land, Environment and life in Fort Albany First Nation in Canada (p. 68).” They note that, “the term Paquataskamik is about relationship to the Lands which comes from Indigenous laws and governance, and is grounded in Indigenous Land Knowledges that have always existed (pp. 78–79).”

Significantly, [Dei and Jaimungal \(2018, p. 61\)](#) speaks about Indigeneity,

As a process of identity formation, Indigeneity is also about politics and resistance. Indigeneity is developing an Indigenousness or an Indigenous consciousness of who one is and the importance of using such Indigenous identity to resist colonial, and on-going, colonial impositions.

Dei adds, “Indigeneity has a close relationship to Land. It is about the politics of the Land that gives a people their identities.” Further showing that Land is the center for the lives, cultures, and identities of Indigenous Peoples. The United Nations Department of Economic and Social Affairs (2009) asserts that Indigenous peoples globally express and enact their inherent rights over their Lands, their territories, and natural resources to governments. Due to imperialism and colonialism, both historically and today, “Indigenous peoples have been dispossessed of their Lands or faced the threat of dispossession and forced removal, leading to increased poverty, erosion of cultures and even outright extinction or complete assimilation” (p. 54). For many Caribbean Indigenous peoples, the impact of colonialism since 1492 has been devastating. However, Taino People, and Indigenous People globally, continue to rebuild their governance systems. We are reminded that Land is where the ancestors are buried and where sacred places are visited and revered ([United Nation, 2009, p. 53](#)).

[Dei and Jaimungal \(2018, p. 18\)](#) speak to the ways in which Land is lived and felt and of its connection to Indigeneity.

The Land is also intricately tied to Indigeneity and the saliency of Indigeneity and its connection to the Land is crucial to highlight. Land is taken both concretely and metaphorically, allowing bodies to implicate space and learning. Land evokes more than a physical presence. It is a spiritual place and a spiritually centred understanding of social space.

This draws me back to reflect more on the story shared earlier by the Kalahari Elder and the intimate relationship with, and emotional attachment to, Land. Additional examples, according to [Koot et al. \(2019, p. 342\)](#), show that belonging, as it relates to Land, is of key importance to “Indigenous’ people of southern Africa, who articulate their Indigeneity in many ways” They note that “perhaps none more potently than through their struggle to demonstrate their unique connections to and interdependence with the land within these neoliberal contexts.”

Indigenous Peoples are close to the land, and many still depend on it for their livelihood ([Cajete, 2020, p. 3](#)). Throughout the world, Indigenous people continue to exercise their rights to their Lands. For example, [Koot et al. \(2019, p. 342\)](#) point to the Hai//om San who, they explain, were evicted from Etosha National Park. [Jaffee and John \(2018, p. 1407\)](#) discuss how “Land appropriation, resource extraction, linguistic genocide, forced removal, erasure, and devastation by settlers invariably wreaks havoc on the land, spirit, livestock, and bodies of Indigenous peoples.”

Yet, another example of the ways in which Indigenous people are violently displaced occurred with the removal of Batwa families from the Kahuzi-Biega Forest in the Congo. There were promises of compensation for the families, but those promises were not honored. The Batwa peoples were traumatized and were not allowed to even hunt in the park. The literature shows that they now lack food, medicine plants, “and the forest is no longer their place of worship”. As the [Report of the African Commission \(2005, p. 22\)](#) explain, “The Batwa have been culturally and psychologically shattered by the loss of their forests” ([Report of the African Commission, 2005, p. 22](#)). The Land and its forest, the ancestral home of the Batwa is critically linked to their identity and Indigeneity as Indigenous people. These examples demonstrate the dangerous and capitalistic characteristics of colonialism and the capitalistic obsession for Indigenous lands. It works similarly globally. [Barker and Battell Lowman \(2015, para 3\)](#) explain, “Settler colonial societies around the globe tend to rely on remarkably similar spatial constructs, power structures, and social narratives.” They state, “Beginning with terra nullius—the perception that Lands in long-term use by Indigenous peoples are empty or unused—settler colonization proceeds to carve up Indigenous-held lands into discrete packets of private property.”

Meanwhile a [Final Report \(2021\)](#) for the Athabasca Chipewyan First Nation provides detailed accounts of the history of the Wood Buffalo National Park in Alberta, Canada, and the relations with the Denésuliné. The report details the systemic removal of the Denésuliné from their ancestral lands. According to the report, once evicted, many people’s homes were burned down; they lost cabins and belongings” (p. 74). Like Indigenous People elsewhere, the Denésuliné’s relationship with their lands is foundational to intergenerational transmission of their knowledge systems and their lives (p. 25). Even when Indigenous People have been displaced from their Lands or have been away from it, many still feel the connection in their heart. As an example, [Warren \(2016, p. 697\)](#) speaks to the cultural and spiritual significance of the Land to the Mapuche people. The author asserts, although they will move to cities, Mapuche youth “see their relationship with nature in the countryside as what differentiates them from non Mapuche Chileans”. It is through the Land that teaching, and learning take place in many Indigenous worlds. Land and learning epitomize and personify Indigenous Education systems and their Indigeneity ([Neeaganagwedgin, 2021](#)).

Indigenous education systems

Indigenous Lands and education systems are interrelated and attached. Land is embedded in relationships with the people, plants, and other living beings. Indigenous knowledge and Education come from the Lands. According to Bishop (2020, p. 6), knowledge exchange has been happening for generations and in doing so it has ensured a continuous sustenance and abundance for people. Bishop (2020, p. 8) writes “There is no universal version of Indigenous education sovereignty, nor should there be.” Bishop states that this is because, Indigenous Peoples have many forms of education which are connected to their Indigeneity. Most importantly, for Cajete (2005, p. 71), the role and importance of the extended family, the clan and the community provide context and serve as the source of teaching. Bishop (2020, p. 7) asserts that Indigenous Education involves “intergenerational relationality; knowledge sharing through Indigenous processes.” Meanwhile, Alfred and Cornstassel (2005, p. 598) discuss how settlers continue to follow the colonial legacy of their ancestors to erase Indigenous Peoples, histories, and geographies, which is at the center of Indigenous identities. For example, Canada’s residential school system lasted for hundreds of years. Its intention was to erase Indigenous peoples from their identity and sever their ties to their ancestral lands and their Indigeneity. However, Indigenous Peoples have their own education systems which they have had since time immemorial, and certainly prior to the European sense of entitlement to Indigenous Lands through the idea of *Terra nullius*, or “the empty lands”. The settlers’ desire for Indigenous Lands historically was relentless and remain that way today. It was revealed through the European education imposed on Indigenous children and families. According to the previously mentioned Final Report (2021), Indigenous children often faced extreme hunger, disease, and physical, mental, emotional, and sexual abuse (2021, p. 39). This systemic abuse, and erasure is part of the structure of Canada’s residential schools designed to inflict genocide on Indigenous People. Sium et al. (2012, pp. I–XIII) discuss how colonialism and white supremacy have viewed Indigeneity as “different and threatening” and as something to marginalize and erase out of existence.

Moquino and Kitchen (2020) state that Canada’s residential schooling served to violently assimilate Indigenous people. They make the connection between Land theft and the assault on Indigenous sovereignty. The Canadian system continue to erase Indigenous youth through its contemporary education system which remains structured on Eurocentric models and approaches.

The education system today is still centered on the historical continuation of settler-colonial logic of elimination (Wolfe, 2006). This means that the school and education system is immersed in a system that expects everyone else to fit into it as it incessantly reproduces itself with the intent to erase Indigenous youth. Moquino and Kitchen (2020, para 20) state that the colonial schooling has functioned to maintain settler colonialism through epistemicide—the attempted killing of knowledge.

It is important to understand the purpose of education, who education is for, and which forms of education counts. Is education for assimilationist purposes? This is an important question that must be critically considered when thinking about both education and schooling (Report of the African Commission, 2005, p. 55). In 2020, The World Health Organization declared a pandemic. Bishop (2020) suggests that the coronavirus pandemic has changed how education is carried out globally. As Bishop states, it does not mean that education has not remained Eurocentric. Rather, the author points out that the response to the pandemic has shown that systemic transformation can happen, and it can be done quickly (p. 6).

Indigenous People’s right to their education are affirmed in the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP, 2007), Article 14, Number 2, states the following unequivocally. Indigenous individuals, particularly children, have the right to all levels and forms of education of the State without discrimination (p. 13). Indigenous people’s rights to their education are on an individual and collective level. Many Indigenous nations continue to implement their own education systems, and Cajete calls for the creation of community-based curricula (Cajete, 2020, p. 7), and specifically curricula that reflect Indigenous peoples’ multiple worldviews. The author provides an example of the Medicine Wheel, Corn, or Tree of Life symbolism which have deep metaphorical meanings that frame essential goals and visions of Indigenous education and sustainability.

These wholistic models of education are designed according to Indigenous ethics and models. Cajete (2020, p. 7) exclaims, Indigenous educators work with Indigenous communities and students around place Land and project-based curriculum models. Indigenous education involves developing relationships between teacher and learner and ongoing commitment and that relationality is reciprocal (Bishop, 2020, p. 10). Harris and Wasilewski (2004, p. 494) say of this reciprocity that “overlapping relationships will always take care of us. This was why there were no orphans in Comanche society”. Indigenous Education means the family is at the center of learning, teaching and relationships. Harris and Wasilewski write children were the responsibility, not just of the mother, but of the mother’s entire family and, ultimately, of the community. This is another example of responsibility emerging from relationships. This is what Cajete refers to as a “dynamic flow of interrelationship” (2015, p. 365). Indigenous Lands and education systems are interconnected and entrenched in the understanding of Land as a wholistic Knowledge system that embodies the concept of reciprocity.

Indigenous philosophies of reciprocity

Similarly, Reciprocity, like Land and education, involves exchanges and is part of Indigenous worldviews, governing systems, and Indigeneity. Reciprocity is a cyclical obligation. It emphasizes the fact that, in nature or natural law, there is a circular model approach. For instance, the seasons, life, as well as the dynamics between any two entities in relationship with each other. Once we have encountered another, we are in a relationship with them write (Harris and Wasilewski, 2004, p. 493).

According to [Cajete \(2020, p. 9\)](#), Indigenous worldview is relational. Moreover, building upon and extending reciprocity is an essential process for developing relationships. Reciprocity is then interconnected with relationships. [Alfred and Cornthassel \(2005, p. 609\)](#) assert, Indigenous identity, and interconnection, which is historical, ceremonial, and involves languages and Lands, is also about relationships and kinship networks. Reciprocity is structured within kinship which is connected to Indigenous Land and education systems. Moreover, it is through these relationships that [Bishop \(2020, p. 5\)](#) writes about Indigenous sovereignty being enacted in everyday lives through these interconnecting relationships which are immersed in giving and taking and the principle of respect. In Canada, despite the history of, and contemporary reality of, settler colonialism, as well as the history of the Canadian state's genocidal residential school systems, Indigenous people continue to transmit their knowledges ancestrally and generationally. This includes models of reciprocity of how to live the "good life" for which Indigenous peoples globally have their own terms in their own languages. This exemplifies the values of relationships and the significance of community to Indigenous peoples. What's more, intergenerational reciprocity is a reminder of Indigenous people's obligations to one another—not simply to give back, but to listen, to share, and to give forward ([Bishop, 2020, p. 11](#)).

[Postero \(2013, p. 442\)](#), writes that to understand Indigeneity as embodied in a reciprocal relationship with other-than-human beings raises questions and challenges of what constitutes knowledges and forms of knowledges. Additionally, reciprocity is about sharing, and Indigenous lived experiences are connected to Indigenous education. For instance, Indigenous lived experiences focus on the ways in which Indigenous bodies—in all their diversity—are treated in the colonial present, and how bodily experiences come to express the boundary between indigeneity and non-indigeneity ([Postero, 2013, p. 437](#)).

As Alfred and Cornthassel assert (2005, p. 609):

it is the need to maintain respectful relationships that guides all interactions and experiences with community, clans, families, individuals, homelands, plants, animals etc. in the Indigenous cultural ideal. If any one of these elements of identity, such as sacred history, is in danger of being lost, unified action can be taken to revitalize and restore that part of the community by utilizing relationships, which are the spiritual and cultural foundations of Indigenous peoples.

Reciprocity is learned through Land ethics and is lived, observed, and taught by family and the land itself symbolizes Indigenous pedagogy. Indigenous youth today practice ceremonies and Indigenous models of education regardless of where in the world they live, as they did prior to contact with European colonizers and settlers. Youth learn about the Land and plants through their everyday lived experiences. For that reason, reciprocity among people, as an Indigenous foundation, is intimately connected, interactive and interdependent on one another. It is this deep respect for relationships that embeds family relations, and community ([Cajete, 2015, p. 365](#)). These relationships inform Indigenous knowledge transfer systems generationally, but also as a site of memory within the body. [Dei and Jaimungal, 2018, p. 63](#)) emphasizes Indigenous critical perspectives, practices, epistemologies, roles, and spaces for sharing and producing local cultural knowledges and their importance to community and relationships.

For [Cajete \(2015, p. 367\)](#) the life of Indigenous community is mutually reciprocal and interdependent with the living communities in the surrounding natural environment. Although Indigenous peoples come from many different languages and cultures, these similarities in their focus on interrelationships are embodied within. Indigenous societies and knowledge systems have developed to sustain reciprocal relationships between culture and nature, and therefore they use scientific approaches that are rigorous in their own methods and rely on long-term observations ([Johnson et al., 2015, p. 8](#)). This intricate and dynamic relationship demonstrates Indigenous worldviews alive and in action. Reciprocity includes additional core Indigenous principles and philosophies. For example, [Harris and Wasilewski \(2004, p. 492\)](#) refer to these core values as the Four "R" s which include the relationship, responsibility, reciprocity, and redistribution. These Four "R" s personify Indigenous ethics that are central to Indigenous ways of life. Moreover, the authors speak about relationships as the kinship obligations to the multiple forms of life that exist and interrelate with one another.

[Cajete \(2005, p. 70\)](#) discusses the processes and principles of reciprocity between humans and all living beings and reinforces the idea that reciprocity is also grounded in relationality. Indigenous peoples, through their lived experiences and worldviews, understand how relationships shape and influences responsibilities. The relationships are grounded in Indigenous ethics of relationships and are connected to the concept of Indigeneity ([Harris and Wasilewski, 2004, p. 493](#)). Given the history and impact of the devastation of colonialism and the ways in which its destructive history and current actions have created serious implications for Indigenous peoples Throughout the world, there has been a reassertion and regeneration of Indigenous lifeways. [Kimmerer \(2018, p. 41\)](#) speaks of restoring reciprocal relationships and reengaging people with the Lands that continue to provide sustenance. This understanding is related to Indigenous identity and is rooted in the essence of the Indigeneity of Indigenous peoples globally.

Conclusion

This chapter has provided a discussion of the concept of Indigeneity, and the importance of relationships, Lands, Indigenous Education, and reciprocity to Indigeneity. Although Land is of critical significance to Indigenous Peoples regardless of where they live, many Indigenous people have been systemically removed and displaced from their Lands. Indigenous People have been impacted in different ways and at different times by this violent and systematic separation and displacement from their Lands.

As Radcliffe, 2017 observed, settler colonialism is ongoing, and it is not just a historical or single event. Consequently, Indigenous people continue to be impacted in multiple devastating ways which go beyond geography. Reciprocity with Indigenous educational approaches and the Land have also been impacted because settlers, historically and in current times, continue to have a deep obsession with, and desire for, Indigenous lands. Yet, Indigenous people are finding their own ways to regenerate and rebuild their Lands and pedagogical systems which are grounded within the principle of reciprocity.

Indigenous Peoples come from multiple places and understandings of connectedness and relationality. Therefore, it is recognized that to speak of Indigeneity is to also acknowledge that Indigenous people around the world are not uniform or static (Romm, 2015, p. 420). Indigenous People come from dynamic and fluid cultures. According to Alfred and Cornstassel (2005, p. 597), "the world's indigenous peoples in their cultures, political-economic situations, and in their relationships with colonizing settler societies are varied." However, their determination, "to survive as distinct peoples on foundations constituted in their unique heritages, attachments to their homelands, and natural ways of life is what is shared by all Indigenous peoples."

No matter where Indigenous People are in the world, it is essential and necessary to listen to them. Listening is an Indigenous educational model and approach which binds Land and reciprocity. To develop reciprocal relationships requires deep listening. To understand the Land means to be able to listen to its stories. Indigeneity begins with listening to, and honoring, Indigenous voices. Indigenous people centering Indigenous voices are creating and constituting, reciprocity, wherever in the world they might be.

There is no such thing as a single-issue struggle Lorde

Almost all social science handbooks and encyclopediae contain a chapter on intersectionality (Dill and Kohlman, 2012; Grant and Zwier, 2017; Sibbett, 2020). A number of systematic reviews also exist on the subject (Harris and Leonardo, 2018; Nichols and Stahl, 2019; Robert and Yu, 2018). In December 2013, the United Nations General Assembly adopted Resolution 68/237 which proclaimed 2015 to 2024 to be the International Decade for People of African Descent, with the theme “People of African Descent: Recognition, Justice and Development.” The theme emphasizes promoting greater knowledge, recognition of, and respect for the culture, history and heritage of people of African descent, including through research and education (UN, 2013). Considering this declaration and the global Black Lives Matter movement, we sought to focus on intersectionality research in education by people of African descent in Africa and the Caribbean whose scholarship addresses matters of Black life and well-being from an education standpoint. Furthermore, given the international charge of this volume, this chapter is devoted to an exploration of whether and how intersectionality is used in the educational research literature of these two regions as a way of inclusively and comparatively internationalizing the discussion of the concept and in this way probing some of the gaps, limitations and possibilities of intersectionality.

In our initial meetings regarding this project, we posed the question of whether intersectionality is an ‘Americocentric’ term used in social justice studies in education in the Northern hemisphere, and, perhaps even an imperial imposition of ways of knowing and being onto Global South regions. We posed the question, “What might be the correspondences in predominantly Black countries? In other words, how might African continental and African Caribbean researchers understand and theorize the complex dimensions and processes of their lives, in their own contexts? What might be the (equivalent or unique) terminologies specific to those settings? What kinds of intersectionalities can we talk about in these regions?

Intersectionality: a black feminist concept

A brief overview

In this section we review the concept of intersectionality, developed in the United States by critical feminist legal scholar Kimberl Crenshaw. The concept was first advanced in two law review articles (Crenshaw, 1989, 1991) whereby Crenshaw highlighted the ways in which African American women were misrepresented or erased in the legal system. This theorization critiqued linear single-issue agendas and additive approaches to Black women’s lives (Bilge and Denis, 2010; Bowleg, 2008). The concept stressed the multidimensionality of African American women’s experiences that include race, gender, and class and other dimensions and how they intersect in distinct ways in societal of marginalization and subordination. The dynamism and simultaneity of these social identities were not being taken into account in legal cases, causing further systemic inequalities for Black women. Intersectionality, then, was advanced as a way of analyzing these interconnections between inequalities in a complex system of power. Intersectional frameworks do not envision oppressions as competing, but rather as working mutually in and through all social relations and systems of power (Collins, 2017). African American scholar Patricia Hill Collins stresses the importance of a historical understanding of the theory and practice of intersectionality (e.g., Collins, 2000, 2015; Collins and Bilge, 2016). That is, although the term is attributed to Crenshaw who provided an analysis in her legal writing, intersectionality has been a fundamental part of Black women’s epistemology, activism, and intellectual tradition. In the United States, the “Ain’t I a woman” speech of abolitionist and former slave Sojourner Truth (1797–1883), at a women’s rights convention in Ohio in 1851 and the writings of Maria Stewart (1803–79) are two early examples of what we now understand to be an intersectional analysis. Likewise, the *Combahee River Collective Black Feminist Statement* (1977) and other Black feminist scholars wrote about the intersecting multiple oppressions and

recognized the ways in which multidimensionality and simultaneity of their lived realities in a complex system of power relations before Crenshaw's analysis, often using descriptions such as "interlocking" or "intersecting" (Collins, 1987; Davis, 1981; Zinn and Dill, 2016). Indeed, Black women throughout the African diaspora are able to describe their lived realities of power and subordination, regardless of social location. This concept has provided a tool for Black feminist researchers to broaden as well as sharpen their analyses of Black women's lives and realities and analyze the ways that their realities may vary across identities (such as class, sexuality, disability) and race and contexts (such as urban, rural, poor). Theories know no borders and thus the concept has been embraced across the English-speaking African diaspora as well as across international research communities. Time and space do not allow for a discussion of the ways that intersectionality has been "stretched" and reshaped across geographic contexts, nor its critiques (see Evans, 2016; for a discussion in the UK, especially among young people.).

Intersectionality across disciplines

Since the 1980s, intersectionality has increasingly been applied to academia, applied professions, and justice-oriented praxes to critically analyze and change systems and processes of inequity and marginality. Intersectionality has been subject to much critique, such as lacking theoretical clarity (McCall, 2005) becoming diluted and depoliticized (Bilge and Denis, 2010), being coopted by White women, thereby erasing Black women's theoretical and political traditions (Mugabo, 2022; Nash, 2017). Canadian sociologist Sirma Bilge (2020) writes that intersectionality has become, "an empty shell onto which scholars of all stripes can project their own concerns and feel legitimate to do so" (p.1). At the 2014 American Studies Conference, on a panel called "Kill this keyword," intersectionality was declared "dead" as one of the keywords to be eliminated. This act is reminiscent of other "deaths," such as the death of the subject, in which Nancy Hartsock suggested, "Why is it, exactly at the moment when so many of us who have been silenced begin to demand the right to name ourselves, to act as subjects rather than as objects of history, that just then the concept of subjecthood becomes 'problematic'?" (Hartsock, 1983, p. 196). Indeed, Nash (2019) suggested that in essence the declaration to kill intersectionality was a declaration to kill Black women. Canadian Black feminist Délice Mugabo (2022) sums it up: "In other words, Black women's intellectual labor must be erased for intersectionality to reach its latent potential for white feminism."

Intersectionality in education

In education, intersectionality as a critical analytical tool is applied to unearth and challenge inequities for feminist researchers (Henry, 2015; Nyangweso, 2017). For example, Henry (2015) contends despite her leadership position as a department head, unlike her white male predecessors, her race, gender and perceived "outsider" status positioned her as inferior and incompetent according to her white colleagues in a white supremacist institution where systemic racism pervaded daily routines and practices. An intersectional analysis allowed her to prise apart the complex system of power relations in which she was embroiled.

Intersectionality is often employed as part of a larger Critical Race Theory (CRT) framework. CRT originated in the 1970s. Activist lawyer Derrick Bell and a group of mostly Black legal scholars at the time were interested in the ways that race and power were structured and routinized into every facet of life in the United States. Since that time, it has evolved and been adapted to many marginalized groups. Offshoots such as Critical Latinx Theory or LatCrit (Martinez, 2019), Critical Asian Theory or AsianCrit (Iftikar and Museus, 2018), Critical Disability Theory or DisCrit (Annamma et al., 2013) have emerged as specific applications. Likewise, critical scholars who study race outside of the United States have adapted and reshaped Critical Race Theory for their contexts. The tenets of CRT are easily adaptable across white supremacist capitalist societies all of which are characterized by structural and institutional racism.

Education researchers use intersectional frameworks and CRT (which includes intersectionality) to examine inequalities across multiple social contexts and identities and how these influence educational opportunity and disparities in distinctive ways (Núñez, 2014; Harris and Leonardo, 2018). For example, James's (2021) analysis of Black male student success in Toronto, Canada takes into consideration constructs such as class, nationality, ethnicity, school environment, community influences, parental education and whether the youth are first or second generation. Critically probing the simultaneity of all these dimensions and how they played out in the boys' lives affords a more complex understanding of why one boy became a successful lawyer and the other, a bus driver. As Patricia Hill Collins and Valerie Chepp (2013, p.58) write: "[T]hese constructs signal an intersecting constellation of power relationships that produce unequal material realities and distinctive social experiences for individuals and groups positioned within them." Similarly, in their systematic review of intersectionality in higher education, Nichols and Stahl (2019) concur: "when considering the workings of multiple systems of (dis)advantage across gender, race and class, it is not possible to simply focus on academic participation and achievement in isolation from the social and personal aspects" (p.7).

Intersectional educational research is found, for the most part, in qualitative studies (Covarrubias and Vélez, 2013). Quantitative studies may present certain challenges regarding intersectionality—perhaps the reason for terms such as "intersectionality-informed" quantitative approaches (Rouhani, 2014). Bowleg (2008) argues that statistical methods, even those that test interactions, were not designed with the study of intersectionality in mind (p. 320). It is important to acknowledge that one's choice of methods is determined by the kinds of research questions being asked, the underlying epistemological underpinnings, as well as one's view of factors such as the nature of knowledge, and the purposes and meanings of research. Nonetheless, educational researchers have been stretching the boundaries of intersectionality using Critical Race Theory studies in education to examine inequalities using quantitative methods, hence the range of terms QuantCrit (Gillborn et al., 2018) QuanCrit (López et al., 2018), and CritQuant (Sullivan et al., 2010). In her 2018 article in the *American Educational Research Journal* (AERJ), Sung Tae Jang (2018) advances a quantitative

intersectionality analysis of South East Asian females' educational outcomes in the United States. She argues that the use of numbers and statistical inferences reveal structural inequalities deeply associated with power relations between different social categorizations and that "In this regard, critical quantitative researchers have an essential and powerful role in creating conditions of equity that attend to intersectionality: They can inform and alarm policymakers and school leaders about structural inequalities as well as realize educational equity and social justice" (p.1299).

Cho et al. (2013) laud "the remarkable degree of theoretical and methodological engagement that the concept of intersectionality has invited among feminist and antiracist scholars around the globe" (p. 787). Tormos (2017) writes that "intersectionality has gone global" (p.1). How global is the concept of intersectionality? It was indeed our quest to examine whether intersectionality was even a concept in Global South education research as we were not familiar with its usage in these regions in the educational literature. We set out to explore research articles between 1990 and 2020, given the date of Crenshaw's seminal articles in 1989 and 1990. More challenging were decisions about criteria for inclusion. For example, do we include diasporic authors who may have left their birth country and who write about education in their homelands? Epistemic questions were always at the fore: the term comes out of African-American reality. Can we apply African American terminology to the African diaspora with their varied histories of capitalism, slavery and colonialism? We wondered whether we would find sufficient studies, at first, and whether we were imposing American conceptual patterns of thinking on global contexts. We also wondered, whether it was imperative for authors to use the word "intersectionality"? (See Roth (2013) who contends that the concept is deeply Euro- and US.-centric can be seen as an instance of epistemic Occidentalism and thus must be rethought for use in transnational contexts and for other locations of knowledge production).

We discuss our methods in the respective sections of the Caribbean and Africa as we were examining different parts of the globe, different, journals, and regions with different racializing histories.

The Caribbean

It is important to acknowledge the diversity and hybridity of the Caribbean. This majority Black region consists of 15 nation states: It has endured various histories of European enslavement and colonialism. It is comprised of various ethnicities, races, cultures, European languages, Creoles and identities. It is, thus, a multiracial, multilingual, multi-faith region that has undergone inter-racial mixing through waves of migrants. It is comprised of many groups such as Blacks, South Asian, Chinese, Jews, Arabs, Europeans to name a few. Similar to many nation states with a history of colonialism, its Indigenous populations are insufficiently acknowledged.

The inclusion criteria for the Caribbean articles were that they had to be written by African Caribbean people who lived and worked in the English-speaking Caribbean and who wrote about African Caribbean educational issues using intersectionality. That is, papers by African Caribbean people living outside of the Caribbean would be excluded in understanding current trends in Caribbean countries. Admittedly, this criterion was problematic by definition, a limitation of the research that risks essentialism. Firstly, as noted above, due to the multiraciality of the Caribbean, the notion of "Black" is quite variegated, and often politicized. Thus, how can we always know how authors identify themselves in this polyracial region? Identities are intertwined with other social categories, so that, for example, race, skin color, religion and gender are intimately articulated within structured hierarchies in Caribbean countries (Law and Tate, 2015; Thomas, 2011). Secondly, due to scholarly collaborations and global mobility, scholars who reside in the Caribbean collaborate globally and these international collaborations produce exciting new understandings and thus, as mentioned above borrow and re-shape theories from North American and British contexts. In fact, in conducting research for this essay, we were struck by the amount of Caribbean/diasporic research collaborations between Caribbean-based researchers at the University of West Indies and their Caribbean colleagues in other countries, especially in the United States. All this to say, it is important to acknowledge up front, the impossibility of total accuracy and to focus on the larger goal of exploring if and how intersectionality was a tool for Caribbean educational research.

The initial searches in databases such as Summon, EBSCO Academic Search Premier, ERIC and Google Scholar revealed that few studies published in the Caribbean were accessible through the databases. For example, an EBSCO search for articles using the descriptors "Intersectionality," Caribbean," and "education" written after 1990 that explicitly acknowledged intersectionality in the title or abstract or in the main argument yielded 20 articles (This was one of many descriptor searches.) Only one study was conducted in the Caribbean that is, Ellis's insightful (2018) intersectional study of boys' achievement in a Jamaican classroom in *Gender and Education*. Another study, Khabir's autoethnography of her four months in Brazil was published in the *Journal of Education and Development (JEDI)* a Caribbean journal. Our aim was to feel the pulse of Caribbean-based scholarship Neither study met the criteria, as the former was a doctoral student in Canada and thus influenced by the Canadian scholarly conversations. The second was a narrative of an African American woman. Based upon the available search findings, a decision was made to focus on the educational studies in *The Caribbean Journal of Education (CJE)* and *The Journal of Education and Development in the Caribbean (JEDIC)*. We had access to the abstracts through the University of West Indies sites, <https://www.mona.uwi.edu/soe/publications/cje>, and <https://www.mona.uwi.edu/soe/publications/jedic>. Unfortunately, the searchable software program only allowed access to abstracts rather than access to articles. These journals were chosen for accessibility and because they represent two long-standing, well-regarded peer-reviewed Caribbean educational journals in which Caribbean-based and international authors publish their empirical research. This choice created an immediate concern of not representing the range of methods and studies produced in the Caribbean, as authors may choose to publish in other Caribbean-based journals outside of education or in international education journals. Intersectionality as a search term was absent in these journals. Thus, we employed other key terms such as "gender"

and “ethnicity” singularly and in combination: “gender + ethnic(ity)”, “religion” and “boys and achievement, socioeconomic and Religion”. Indeed, after finding authors’ work with these descriptors, we cross-checked with Google Scholar and library databases for 1) the article in question, or a variation thereof in another journal, b) other works by these authors that could ascertain their conceptual and analytic frameworks; and c) authors’ ResearchGate and [Academia.edu](https://www.academia.edu) accounts for versions of select papers. These steps were added to find full-length articles, and not to rely solely on the abstracts. Furthermore, along with cross-checks from co-authors, they acted as a trustworthiness check, due to the inability to access more than the abstracts in CJE and JEDIC outside of the Caribbean.

The above challenges were two of many systemic challenges in the attempt to gather Caribbean research studies in education. Databases in five library systems in the USA and Canada were searched. Libraries lack subscriptions to journals in the Global South. This has far-reaching consequences for scholars world-wide. Researchers in developing and Global South countries often rely on databases, journals and research from North American and European countries, yet researchers in North American and European countries are less interested in their Global South colleagues’ research. The institutional Whiteness manifest in library holdings dampens intellectual dialogue between Global North and South regions and represents a powerful hierarchy that determines whose knowledge is worthwhile, what methods are ‘rigorous’ ‘scientific’ and ‘valid’ and whose work gets reviewed and published ([Galvan, 2015](#); [Olson, 2004](#)). Therefore White norms remains comfortably intact ([Yancy, 2012](#)). Certainly, libraries have budgets and cannot possibly subscribe to every possible journal. However, Black knowledges are low on the hierarchy of what is deemed most valuable knowledge.

These systemic challenges represent the ever-present legacies of White supremacy and colonialism in Education. In sum, these institutional challenges exemplify intersectionality in everyday life—How social inequalities are reproduced through power relations that is, the ways that capitalism, racism and Whiteness and the knowledge economy produce political and intellectual domination in people’s lives and have larger consequences of people in the Caribbean.

All abstracts from CJE (1997–2021) and JEDIC (1974–2021) were searched for “intersectionality” as they were readily available online. These two majority-Black peer-reviewed journals have steadfastly published Caribbean-based empirical studies using a range of methodologies - quantitative, qualitative and mixed methods research and conceptual frameworks. With the exception of Khabir’s intersectionality article mentioned earlier which does not meet inclusion criteria, the preponderance of articles in the journals employed classical empirical research designs and did not use intersectionality as a conceptual or methodological tool in the ways that it has been formulated by Crenshaw or CRT educational research. Indeed, studies examined multiple factors that influence student achievement. For the most part, these multifactorial studies were quantitative (descriptive and correlational studies examining factors influencing phenomena), such as the relationship between parenting style and adolescent communication ([Anderson and Cole, 2017](#)), associations between variables such as gender, ethnicity, socioeconomic status, and disability in the examination of literacy in underperforming youth ([Smith et al., 2020](#)). Explicit analyses of power relations were not part of these theoretical frameworks. Only one qualitative article “A Critical Multicultural Analysis” of Jamaican Children’s Literature explicitly acknowledged the oppressive power structures of race and class and the legacies of slavery and colonialism as a central organizing principle ([Richards, 2013](#)).

By comparison, *The Caribbean Review of Gender Studies (CRGS)*, published at the University of West Indies, at the St. Augustine Campus in Trinidad and Tobago, was more likely to include interdisciplinary scholars as well as education scholars who utilize intersectional frameworks and who live and work in the Caribbean (e.g., [Stewart, 2019](#)) or the Caribbean diaspora (e.g., [Douglas, 2019](#)). This journal was not included in our study as it is not an educational research journal. However it points to the reality that in general, Caribbean authors publish in journals with aims and scopes that appeal to particular audiences, many of which as noted above, are international. Our narrowly defined research domain is not representative of the range of frameworks in which Caribbean education researchers are carrying out their research, nor does it examine the scope of intersectionality research employed by scholars in the Anglophone Black Caribbean diaspora. Instead, it exemplified the studies published in its two major education journals as an exploration of intersectionality in this region and gave an overview of the types of educational studies conducted.

In sum, based on a review of CJE and JEDIC abstracts, at the time of writing, intersectionality as a method of critical inquiry had not been readily employed in Caribbean educational research journals in the ways that it has been defined earlier. However, many Caribbean colleagues are engaged in transnational research connections, it will mostly likely be adopted in educational research since it is currently being used in other Caribbean scholarship (e.g., [Bailey and Ngwenyama, 2012](#); [Stewart, 2019](#)).

Despite the fact that the studies examined cannot be considered “intersectional” by Crenshaw’s definition, nonetheless, Caribbean scholars (and most people living in the Caribbean) are well aware of the legacies of European colonialism in contemporary life: poverty, class, race, colorism, gender are implicated in violence, inequality, oppression and denial of equal opportunity. These very inequities underpin much of the current educational research agendas in the Caribbean using traditional research designs and methods. Significantly, the Caribbean has had a long history of anticolonial struggles and a long tradition of Black radical activist-intellectuals who have critiqued these issues who have made significant contributions in the Caribbean and its diaspora such as Marcus [Garvey \(1983\)](#), Walter [Rodney \(1973\)](#), Claudia Jones ([Boyce Davies, 2007](#)) and Andaiye ([Trotz, 2020](#)), to name a few.

Tormos’s claim that “Intersectionality has gone global,” might very well point to the Eurocentricity of her statement. One might find it encouraging that all that is done in the North is not blindly adopted in South. That said, it is promising to re-imagine studies of social and educational stratification in Caribbean-specific ways to examine how power relations multiply marginalize children’s achievement, for example, and how power operates through structural (e.g., the school) and cultural (churches, families) institutions as well as identities such as sex, gender, class, disability, language, ethnicity, race, and other dimensions. Critically analyzing

the constructs as interdependent and mutually constitutive in context-specific analyses would involve in a reworking of intersectionality from Caribbean-informed perspectives.

Africa

Africa is a continent consisting of 54 countries with over 3000 ethnic communities who speak close to 2000 languages. We recognize the diversity in pre-European contact and colonial histories, education systems and structures as well as the lived experiences in the different countries that make up the African continent. We draw on examples of works of Black African scholars from English-speaking African countries including Ghana, Kenya, Nigeria, South Africa, Uganda, and Zimbabwe to inform our analysis. This implies that the analysis offers perspectives from contexts where English is the “official” lingua franca while scholarship in Indigenous African languages is not represented and is systematically ignored in scholarly research and publications. Nonetheless it would be important to capture the literature from these contexts as their perspectives are seldom heard. Moreover, we did not review articles published in French, Portuguese or Spanish. It is important to recognize that intersectional thinking is embedded in the worldviews of Black African peoples even though it is not specifically named as intersectionality. Black African scholars have built rich scholarship that points to the connections between different identity markers including gender, social class, race, ethnicity, religion, sexuality, as well as location – rural-urban differences – and how these shape people’s lived experiences in the continent. This literature from 1990 to 2010, in the context of our analysis, does not employ intersectionality theory but uses terms such as connects, interconnections, links pointing to intersections, multiple disadvantages, relationships between, nexus, and linkages in their discussions and analysis. (See for example, [Amadiume, 1987](#); [Assie-Lumumba, 1997](#); [Beoku-Betts, 1976/2005](#); [Chilisa and Ntseane, 2010](#); [Ogundipe-Leslie, 1994](#); [Okech, 2020](#); [Oyewumi, 1997](#); and [Tamale, 2000](#)).

Other existing works, largely by feminist scholars, have debated about whether western-originating theories and educational curricula can address the complex realities facing the people of Africa, and especially Black African women. (See [Atanga, 2013](#); [Gaidzanwa, 2013](#); [Mikell, 1997](#); [Mama, 2011](#); [Sudarkas, 1986](#)). While these works reveal their analytic approach of intersectionality, [Nchanji et al. \(2018\)](#) in their commentary observed that they see potential in research naming an intersectionality approach in Africa. Gender theorists, [Nchanji et al. \(2018\)](#) noted that the sociopolitical, economic and cultural environment and the diversity of identities and social categories in Africa make intersectionality research analysis relevant, while bearing in mind that Africa displays commonalities and uniqueness across the 54 countries ([Tshabangu, 2018](#)). Black African knowledges should not become subsumed by western theories. The application of intersectionality in Africa should include the specificities of contexts to minimize the risk of epistemological colonization.

In the last 10 years, Black African scholars in Africa and in the Global North started to apply and name intersectionality theory in studies on food, water and energy ([Ahmed and Mzimela, 2018](#)), land issues ([Akanle, 2017](#)); domestic work ([Maqubela, 2016](#)); crime and incarceration ([Agboola and Rabe, 2018](#)); healthcare ([Marindo, 2017](#)); race and racism in education ([Moagi, 2016](#)); and refugee experiences ([Yacob-Haliso, 2016](#)). In 2017, the journal *Agenda* dedicated Volume 31, Issue 1, to the theme of “Considering Intersectionality in Africa.” This is significant because it was the first time that there was a call for papers specifically employing and naming intersectionality in the African context. Following the call, twelve of the fifteen articles in the issue were by authors based in South Africa. Five of the articles were sole-authored or co-authored by Black Africans. While this outcome was probable, given that the editors of the issue, [Meer and Muller \(2017\)](#), are based in South Africa, it was also a lost opportunity to capture intersectionality’s theoretical nuances, and research reports from other African countries, and particularly those by Black African scholars.

Our analysis focused on applications of intersectionality theory in education in African contexts. We conducted systematic searches of the EBSCO, ERIC Education, and Google Scholar databases through the University of British Columbia library using the terms “education,” “Africa,” and “intersectionality.” We searched these descriptors in the abstracts, titles of published articles and keywords. The initial search yielded 548 articles. We then cross-checked the results for peer reviewed articles, those published between 1990 and 2020 and those written in the English language. We excluded books, book chapters, book reviews, dissertations and reports. We narrowed the search further by geographical location (sub-Saharan Africa), articles authored by Black African scholars located in Africa, and a focus on education, which yielded 33 articles. A close reading of the 33 abstracts revealed that only 13 articles used “intersectionality” as an analytical framework. Next, we read the full text version of the 13 articles paying attention to the inclusion and exclusion criteria. We found that only two of the articles focused on education and were written by Black African scholars who were based in Africa ([Moagi, 2016](#); and [Msibi, 2019](#)). The other 11 articles, although written by Black African scholars, were in the field of Gender Studies, Health Sciences, and Political Science. We also conducted a similar search using the African Journals Online database, which is an open access platform of African-published scholarly journals, and found the same two articles. The two empirical articles showed that intersectionality is used as a framework to complicate and emphasize equity and social justice research and practice.

[Moagi \(2016\)](#) studied how gender and racial relations are played out by high school girls in one South African high school. Moagi employed intersectionality to understand links between class, ethnicity and gender in a school setting. The framework helped to create awareness among the high school girls about the structures that influence racial, ethnic and gender identity, and the ways these structures interact with learners from different races and ethnicities in the school setting. [Msibi \(2019\)](#) researched different ways that Black South African male teachers who engage in same-sex relations negotiate and manage their identities in school contexts characterized by heteronormativity (p.389). The use of intersectionality allowed for unpacking the ways in which multiple forces impact the negotiation and management of identity by the male teachers interviewed [Msibi \(2019\)](#) drew on [Connell’s \(2014\)](#)

works on decolonization of thought, research and application to argue for a localized approach that would allow for understanding of ways in which different identity markers shape the teachers' experiences, and not assume homogeneity across contexts.

It is evident that intersectionality theory is applied to educational research in Africa. However, an accurate scope of its use in education remains to be determined precisely due to our inability to access journal articles from Africa through library sources, as referred to earlier. Many journals were based in South Africa, and much of the scholarship was by White South Africans. Other studies and literature were authored or co-authored with non-Black scholars from the Global North; so they did not meet our criteria for analysis of scholarship by Black Africans based on the continent of Africa.

In sum, the challenges facing the education sector in Africa are best understood and addressed in that context, although there are similar issues in other parts of the world. Applying intersectionality as an analytical framework necessitates that attention be paid to the historical, social, political and economic contexts of the different countries within the continent. It also requires a critical examination of the western-informed methodological approaches privileged in research.

Conclusion

To conclude, we have attempted to give an overview of the historical roots and uses of intersectionality in education with a focus on the Caribbean and Africa as much as possible, given the limitations of textual accessibility mentioned above. While some racialized scholars argue that intersectionality has strayed far from its original intent (Mugabo, 2022) others argue that it has become a hegemonic concept (Galindo, 2011) especially in gender studies. Nonetheless educational researchers, mostly in the Global North, are conceptualizing the innovative possibilities that the theory affords. Intersectional analyses can allow researchers to examine and understand the complex ways people experience systemic marginalization and oppression in various cultures and deepen analyses of educational processes.

Theories are culturally based, and shaped in particular contexts. Wiredu (1996) argues for methodological decolonization. Most research methods are steeped in ways of thinking and knowing that were not developed by people of African descent and therefore do not fully speak to their lived experiences. Although a Black feminist concept, any educational applications in Caribbean and African countries, which are majority Black regions, would have to take into consideration the understandings of how African Indigeneity, race, racialization, imperialism and colonialism are at work in these contexts and their interrelatedness with, for example, class, color, and ethnicity as well as other social identities. We leave this task to our colleagues in these regions, lest intersectionality become yet another colonizing discourse.

Introduction: contested discourses over “girls with disabilities”

Globally, girls with disabilities have taken up a significant part of the disability populations. However, they have been invisible within education. While empirical evidence regarding girls with disabilities remain to be scarce and inconsistent, data from the World Report on Disability shows that female with disabilities reported 41.7% primary school completion, compared to 52.9% of female without disabilities (World Health Organization and World Bank, 2011). Their invisible girlhoods have been intensified within the context of the Global South. Stienstra (2015) observes:

We know little about the intersections of being a child, a girl, and disabled, let alone what it is like in the global South, being Indigenous, or coming from a racialized minority (p. 54).

International interventions on the rights of women and girls with disabilities in recent years have raised some awareness on their barriers to education (United Nations Girls' Education Initiative and Leonard Cheshire Disability, 2017), lack of access to employment, health care, and sexual and reproductive rights (Office of the United Nations High Commissioner for Human Rights, 2017; Human Rights Watch, 2020), and discrimination against their disability and gender (Shah and Bradbury-Jones, 2018). However, these global approaches tend to sideline epistemological and political issues regarding who these girls are, how we come to know them, and what it means to include them in humanitarian and human rights discourses.

Questions regarding how we come to know of “girls with disabilities” are epistemological. Despite the inclusion of “girls with disabilities” within the United Nation's rights-based agenda (United Nations, 2006), these girls are usually silenced within human rights and humanitarian campaigns. There has been little question regarding how to engage these girls in expressing their views, raising their consciousness, and fostering their political agency. Disabled girls are usually depicted as both hyper-visible and invisible within the transnational spaces such as social media and humanitarian discourses (Erevelles and Nguyen, 2016). Specifically, while some disabled girls have been “included” into the public spaces, thus become visible, and sometimes hyper-visible within these spaces, they have been invisible from political activism and other participatory youth-lead agendas (Nguyen et al., 2021b).

The epistemological and political endeavor to disrupt normative assumptions of what it means to be “a girl” has been critical for girlhood studies. Scholars of girlhood studies are “interested in fragmenting the idea of ‘the girl’ ... and draws attention to differences among them” (Gonick and Cannon, 2014, p. 1). They highlight the heterogeneity of girlhoods, including how these girls' identifications and social locations vary across a vast array of race, gender, sexuality, ethnicity, age, and nationality. However, girlhood scholars tend to exclude experiences of disability; and where included, “disability” is primarily discussed as a bio-medical category without interrogating its socio-political implications. Thus, even within this critical scholarship, disability is still seen as a peculiar *thing* attached to their otherwise “normal” able-bodied bodies.

In a report on behalf of the Women Refugee's Commission for the journal of Girlhood Studies, Pearce et al. (2016) posit that humanitarian programs should see these girls as “girl first” (p. 129) rather than their disabilities. They explain that these girls wanted to be identified as daughters, sisters, and friends—that is, as individuals with performative gendered roles and activities. While it is critical to understand how these girls want to be represented, their lived experiences and embodied social relations relative to the contexts where they came from are generally unknown. Here, disabled girls stand in a sharp contrast to the Western framings of girlhood as agentic, independent, and capable of creating changes (Erevelles and Mutua, 2005). This narrative of disabled girlhood justifies ableism - that is, by valuing able-bodiedness and able-mindedness as the descriptive standard of girlhood, this approach to girlhood has justified discrimination against disabled bodies and minds by failing to recognize diverse girls' experiences while

reinforcing ableist assumption about disability. Interestingly, while disabled girls—as a social group—are culturally and politically diverse, this global discourse of “girls with disabilities” tends to frame these girls as a homogenized social grouping in ways that fail to recognize their complex social situations. Indeed, audience in the Global North comes to know about disabled girls in the Global South “from the center” (Connell, 2007, p. 45) where their individualized narratives are usually served as a rhetorical tool for objectifying their vulnerabilities. By erasing the cultural, historical, and epistemological differences which constitute their lived experiences, such discourses have reproduced the “coloniality of being” (Maldonado-Torres, 2007), where disabled girls’ differences are classified, hierarchized, and objectified from the Western perspective.

The “coloniality of being” refers to the consequences of colonization on the lived experience of colonized people and their language in ways that unveil the dark side of modernity (Maldonado-Torres, 2007). Coloniality is different from colonialism in that coloniality refers to long patterns of power that emerged as a consequence of colonialism, but extends well beyond the political, economic, and administrative structures of colonialism. Coloniality defines culture, labor, intersubjective relations, as well as knowledge production through the constructions of categories such as race and gender (Maldonado-Torres, 2007; see also Mignolo, 2018). Thus, research about disabled girls in the Global South can become a form of “coloniality of power” (Quijano, 2007, p. 171) when it fails to elucidate how Black, racialized people, women, girls, and disabled children have been historically constituted as colonial difference, and how actions taken by these groups can serve as a radical point of departure from the epistemic and political violence which marks them invisible.

This approach reinforces epistemic injustice against disabled bodies from the global South, where knowledge about them was “collected, classified, and then represented back to the West” (Smith, 1999, p. 1) through the research practices which reinforce the “coloniality of power.” The intersection between colonial and ableist ideologies creates categories of normative girlhood as able-bodied while erasing difference from the South.

Contested accounts in disability studies

In contrast to humanitarian and academic discourses on girlhoods and rights, political interventions of disability studies manifestos are critical for disrupting able-bodied and able-minded ideologies that constitute disability and difference (Titchkosky, 2011; Garland-Thomson, 2018). These accounts challenge modernist constructions of disability as an individualized problem constituted by the able-bodied norms (Davis, 1995) and create alternative ways of re-imagining disability in cultural, political, and institutional discourses and practices. However, as Jaffee and John (2018) observe, the genealogies and narratives of the field have continued to center canonical texts. As such, disability studies has preserved the very structure it aims to challenge. There is little interest in these bodies of scholarship to learn from or engage with forms of knowledge from the Global South, especially within accounts not traditionally seen as “disability studies.” In fact, the uncritical transfer of Western disability studies into the South has been problematic because it fails to engage with distinctive historical and conceptual frameworks in relation to theories and praxis from the South (Anand, 2015; Mehrotra, 2020; Staples, 2020). By assuming that North American and Eurocentric approaches of disability studies are universal and generally applicable to Southern spaces through Global North interventions (Swartz, 2018), Western disability studies reinforces unequal power relationships between the Global North and South.

Within these contested power relations, disability studies has become unsettling. As a result, questions regarding the scholarship, more specifically, who produces it and from which particular spaces and social location(s), where it is read, and by whom are inherently political (Nguyen, 2021). Researchers from the Global North tend to interpret disability experiences in the South from their locations. This is problematic because it fails to engage with such social experiences from perspectives of disabled people from the Global South. This Eurocentric approach in disability studies reinforces epistemic violence on Southern epistemologies (Grech, 2015). As feminist and post-colonial disability studies scholar Kim (2017) argues, the intellectual’s social location and the politics of enunciation is inherently political. At issue, she asks: “Who speaks of these differences to whom, for what purposes, and in what location?” (p. 230).

Coming from distinctive spaces in the Global South, decolonial disability studies (decolonial DS) is a collective body of knowledge that emerges from the South as a way of reclaiming its existence beyond Western theories and epistemologies (Nguyen, forthcoming). It seeks to critically engage with Western disability studies while at the same time resisting its hegemonic structures that constitutes its difference. Furthermore, decolonial DS offers epistemic and material resources for interrogating individualized concepts of ability and disability, as not natural endowment of human essence, but rather, as consequences of the colonial appropriation of extraction of the Other’s productivity and the disablement of the majority world (Dirth and Adams, 2019). By embodying intellectual projects from the Global South, decolonial DS enables disability scholars to re-visit the limits of Western disability studies from the spaces of bodies and minds historically colonized by Western knowledge and power.

Decolonial DS is critical for research with girls with disabilities in the Global South as it provides an alternative approach to knowledge production in ways that reclaim forms of knowledge that have been absent from Western ideologies. This approach not only rejects the ableist methods to studying “girls with disabilities” as framed in Western social sciences research, but also, its colonial impositions in transnational contexts. Thus, a decolonial DS approach tackles the gaps in research on girls with disabilities by first, addressing the absence of knowledge on girls with disabilities in the Global South and highlighting the epistemologies of disabled girls in transnational spaces; secondly, it challenges the ableist and colonial approaches in research on girls with disabilities by engaging with concrete experiences of these girls in Southern contexts; and finally, it creates decolonial spaces for disabled girls in the Global South to build their leadership and identities in ways that reclaim their existence. In so doing, decolonial DS is a form of enunciation that opens up an opportunity for transforming the Western knowledge system from the standpoints of disabled girls in the Global South.

This chapter aims to reshape the ways in which research *on* girls with disabilities has been conducted in the Global South and proposes a decolonial approach to working *with* these diverse groups. I use the term "girls with disabilities" and "disabled girls" interchangeably to reflect diverse social locations of girls with impairments in the Global South and to respect how these girls prefer to be named from their locations. Drawing on a 4-year research project, Transforming Disability Knowledge Research and Activism (TDKRA), funded by the Social Sciences and Humanities Research Council of Canada (2016–2020) in Vietnam, I will examine how a decolonial approach to research with girls with disabilities can be useful in empowering these girls to re-imagine their spaces, social locations, and express their perspectives on disability through multiple forms of representation. I ask a number of questions: What does it mean to engage girls with disabilities in the Global South? What approaches and theories can be used that consider the lived experiences of these girls? How can we meaningfully draw communities in the Global South in this conversation while resisting the coloniality of power that has driven our research agenda?

Girls with disabilities in Vietnam are situated within a specific context of rapid social change. However, the deep-seated roots of exclusion of these girls could be traced back to the French constructions of Indigenous knowledge systems, where disabled girls were seen as in need of being civilized and normalized (Nguyen, 2015). While the colonial and imperialist regimes were overturned in Vietnam's transition into socialism, colonial practices are still inherent within the nation's constructions of "the race" and its "ideal" populations, where disabled girls are seen as a contrast to the body politics of the nation-state (Nguyen and Stienstra, 2021). At the same time, their situations have been materially shaped by historical war with the United States, which exposed many families to Agent Orange to high level of traumas and suffering because of the intergenerational impacts of the dioxin (Ngo et al., 2013). The socio-economic reforms seen within Vietnam's Doi Moi policy, decentralization and privatization of services, and ongoing practices of state control and population surveillance further reinforced their exclusion. Despite rights-based discourse fostered by the United Nations and non-governmental organizations (NGOs), there is ongoing exclusion and marginalization of women and girls with disabilities within the neo-liberal and neo-colonial context of development.

In what follows, I will use my research experience with girls with disabilities within the TDKRA to demonstrate how a decolonial approach to research with girls with disabilities can be conducted within contested power relations in the Global South. It offers an alternative approach to engaging with girls with disabilities in socio-political spaces that open up new possibilities for re-imagining difference from disabled girls' standpoints. I argue that a decolonial approach to research with girls with disabilities is critical for deepening our transnational conversations in ways that create more inclusive spaces for these girls to tell their stories and to resist exclusion. I posit that this conversation is critical for education research because it creates a meaningful approach for decolonizing hegemonic forms of Western knowledge and invites new ways of framing social justice in the Global South through decolonial DS.

Research as a decolonial praxis: experiences from the TDKRA project

Transforming Disability Knowledge, Research and Activism is a collaborative research project that aims to engage with disabled women and girls in Vietnam. The research is rooted in its purpose of unsettling research and activism by using research as a form of activism that challenges the gap in knowledge with and about girls with disabilities in the Global South (Nguyen et al., 2019). To engage these girls, we used a participatory arts-based approach along with traditional methods such as in-depth interviews and focus groups. While historically visual approaches such as photography were used as a colonial tool to objectify colonized subjects (Rose, 2001), participatory visual methods (PVM) offer a way of shifting traditional research relations through the creation of visual artifacts that are produced by historically colonized and oppressed groups in order to raise their voices about issues that concern them, and in so doing, counter dominant narratives embedded within male, heterosexual, able-bodied, and cis-gendered perspectives (Mitchell, 2011). In the TDKRA project, we worked with girls and women with disabilities in Vietnam using different PVM methods such as drawing, cellphilm (a short video made from cellphone), and photography to engage them in co-producing knowledge about their lived experiences and setting a stage for their activism.

This project was implemented in three communities, including Bac Tu Liem (Hanoi—North of Vietnam), A Luoi (Thua Thien Hue—Center of Vietnam), and Binh Thuy and Ninh Kieu (Can Tho — South of Vietnam). These communities are distinct in terms of their socio-economic, ethnic, and political locations. We engaged 85 girls and women with disabilities in three disadvantaged communities in Vietnam. The girls (10–21 years old) played the role of knowledge producers while the women (20–53 years old) participated in the research training as co-facilitators and mentors to the girls. The girls were also key informants in the project. They worked with the women to share stories about their lives, construct consciousness about their experiences, and develop strategies for connecting and mobilizing their knowledge as a form of collective activism. The majority of our participants came from very disadvantaged situations.

The decolonial aspects of TDKRA were manifested in different stages of the project planning, implementation, writing, and engaging the local communities. Specifically, we sought to decolonize the hegemonic structures of Western research by involving and partnering with Disabled People's Organizations (DPOs) and their communities in all stages of the research. Girls and women with disabilities were recruited through the local DPOs to ensure that DPOs directly involved in the research process as a part of the decolonizing methodologies (Smith, 1999). We collaborated with DPOs through the development of the grant proposal and collaborative agreements such as funding and fieldwork planning, ensuring that the local partners can meaningfully participate and have a voice in the planning and implementation process. While the collaboration was at times challenging, our engagement with the girls and women with disabilities and their organizations was central to relationship building and empowerment of the local communities.

Over the course of 4 years, we collected 55 interviews, 115 drawings, 82 photo images, 111 poster-narratives, 293 audio recordings of the workshop sessions; and 17 cellphilms produced by the girls the workshop sessions. We also co-produced a documentary film with the participation of the girls and women with disabilities across all three communities. We used critical engagement, deep listening, trustworthiness, transparency, and reflexivity as the main criteria for our qualitative analysis (Denzin, 2009). From a critical approach to qualitative inquiry, data is not neutral; rather, it is constructed through “complex interpretive processes [that] shape how evidence is turned into data, and how data, in turn, are coded, categorized, labeled, and assembled into data banks” (Chamaz, as cited in Denzin, 2009, p. 146). This reflects the need to see data as socially constructed and that the context of research is critical for interpreting its outcomes.

Data was transcribed and translated into English from Vietnamese and local dialects (Pa Co and Ta Oi). It was coded and categorized using Nvivo software. We tested out a set of codes which had been used in an earlier project on the educational rights of girls with disabilities in Vietnam (Nguyen et al., 2015) by piloting a number of interviews and visual data. We confirmed and collapsed the codes and sub-codes by considering the significance of empirical evidence. We then identified emerging themes through the data. Additionally, the interviews, captions and visual narratives (drawings, photos, cellphilms) were further analyzed using textual and discourse analysis to make sense of their meaning and implications. The context in which the participants produced knowledge in relation to their class, gender, ethnicities, disabilities, and impairments is critical for the politics of interpretation. We then triangulated the data with our fieldnotes to evaluate the trustworthiness of different types of data.

The next section draws on the results from the aforementioned interviews and visuals (i.e., drawings and cellphilms) to showcase the ways in which participatory visual research, informed by decolonizing methods, can speak to and engage with the diverse perspectives of girls with disabilities in the Global South.

Findings

Understanding complex experiences of girls with disabilities from the Global South

The findings of TDKRA reflect the global dynamics of impairment that have been embodied within the participants’ personal experiences. For example, some disabled girls and young women in the project experienced intergenerational traumas due to being exposed to Agent Orange—one of the most toxic herbicides sprayed by American forces during the US- Vietnam War. They perceived disability as an illness that could be passed on their younger generations. As GWD 11 shared her story: “My brother is disabled because of inheritance of poison from father to child. My father too, inheritance from mother to child” (Fieldwork in A Luoi, 2018).

As a consequence of societal prejudice against their disabilities, some participants seemed to have internalized ableism by assuming that their disability is an illness that could pass on to their future generations. A young woman viewed disability as “a disease,” as manifested in the intergenerational impacts of Agent Orange: “[disability is] ... a disease, just like a normal person who has a catastrophe. There are very few inborn people with disabilities. The parents who suffered from Agent Orange may give birth to the children being paralyzed or being disabled in the leg and arm” (Fieldwork in A Luoi, 2018). At the same time, they shared experiences being discriminated in schools and public spaces. An ethnic girl with disabilities said that her friends used “unacceptable words” such as “crazy” when teasing her. Another ethnic girl shared her story in her minority dialect:

Facilitator: How do Kinh people treat you? Have they ever teased or discriminated against you?

Min: Yes.

Facilitator: What did they say about you?

(Interpreter): They said I was crazy.

Ethnic minority girls with disabilities experienced multiple oppressions due to institutional racism, ableism, and classism. A girl revealed that others treated her as “ugly”: “They spoke badly about me Like I was disabled, I was ugly” (GWD 10). Other girls expressed vulnerabilities when being looked down by their peers: “I feel hurt ... I feel ashamed” (GWD 11). A girl with epilepsy, That Tha, shared the same feeling: “I felt timid, sad. Sometimes I cried.” The intersections of multiple disadvantages constituted their experiences with vulnerabilities.

At the same time, the participants expressed their capacity to counter such oppressions. For example, they resisted ableism by disrupting what their peers said about them:

Facilitator: Is there anyone who speaks badly of you, tease you?

Moon: There are some older students who often said my eyes were like a devil.

Facilitator: When they said that, how did you feel?

Moon: I said: "Although my eyes are not beautiful, my soul is more beautiful than others."

When Moon first joined the project, she expressed feelings of being different and inferior to her able-bodied friends. Here it seems that Moon wanted to resist the ableist attitude by saying that "my soul is more beautiful than others." Her experience is multi-layered, and sometimes conflictual, suggesting that we must interpret the experiences of girls with disabilities through complex social context and relationships with their facilitators. In this case, Moon's resistance against ableism needs to be contextualized within her relationships with her facilitator, who is also a woman with disabilities. Their connections and shared experiences with ableism in school enabled her to frame her discourse while resisting ableist ideology on what it means to be "beautiful." The participants' collective experiences with exclusion and powerlessness were connected with one another in the space where they felt they are not the only one who experienced discrimination. They found the same stories told by their peers. As such, our workshop became a space for them to share their stories collectively, which stands in contrast to the individualized perspective of disability. They also identified positive experiences. For example, a girl who chose her nickname as Nho Mit Uot shared that "Because everyone finds my family poor, they treat me well." Be Cao, a visually impaired girl, talked about her relationship with her mother and how this transformed her sense of the self:

Be Cao: I used to think that I couldn't do anything because I am disabled. But I can earn for my daily living and support my mother.

Facilitator: Nothing we cannot do, remember that. Be strong.

Be Cao: Yes.

Facilitator: How did you feel when you were helped?

Be Cao: I felt so happy because she understood me.

The wording "we" and self-affirmation by the facilitator who is also a woman with disabilities is important and speaks to the contextual and social relations aspect of decolonial DS. It suggests that disabled girls and women can transform their situation through their local disability networks. The participants also expressed a strong interest in participating in social activities as fully capable members of society. Their desire to be seen and heard and to foster social changes within their communities can be further exemplified through their visual productions, which suggest their ways of seeing by capitalizing their strengths and capacities.

Strengths and capacities

A decolonial disability studies approach requires that we resist the tendency of Western research to homogenize these girls' experiences because this would perpetuate their representations as suffering bodies while abstracting their experiences from specific socio-political contexts. In other words, we must critically engage with the local knowledge by creating decolonial spaces for participants to shape their knowledge. The use of creative methods to amplify the voices and capacities of the participants is critical for

generating alternative forms of knowledge co-production in ways that disrupt colonialist, ableist, and male patriarchal perspectives on their dis/abilities.

In a cellphilm entitled “Don’t look down on children with disabilities!”, produced by her group, Be Cao chose to participate and re-imagine her experience from the powerlessness she witnessed when being mocked and made fun of by her peers. This two-minute cellphilm represents the experiences of blind students in school. After their brainstorming, the group assigned the roles of team members. Be Cao played the main character and Moon was the film director. The first scenario shows two disabled girls holding their hands to go to school. Be Cao was playing her everyday experience in navigating her way to school. Another girl with visual impairment, Bup Be, was shown to be walking in the front so that Be Cao could hold on to her shoulder to navigate the direction. The girls did not hold any walking canes in their road. In the next scenario, the film showed some sighted girls walking by, pointing at the disabled girls, and making fun of them. When Bup Be told Be Cao that someone was teasing them, she raised her voice clearly and loudly: “Why are you laughing at me? You shouldn’t act like that!” This “speaking back” moment was quite powerful as it disrupts ableist attitude on their difference and create a space for them to articulate their voice and exercise activism. In their message about the film: “Don’t look down upon children with disabilities! Please care for us!”, it seems that the group wanted to use their cellphilm as a symbolic representation of their collective activism (See also [Nguyen et al., 2021b](#)). That is, disabled students can react determinately and powerfully when they are given a tool to do so.

Talking about her gift to the community, Be Cao said that she wanted to use her voice to share her opinion with everyone. Instead of speaking directly, song lyrics are one way of delivering her messages. Her song, “Live like flowers,” provides some beautiful lyrics on how girls with disabilities wanted to transform their lives by desiring disability differently. Other girls used their drawings to express their desire to participate in the public spaces, design clothes, care for their families and friends, enjoy sports, and develop their leadership skills (see also [Nguyen et al., 2021a](#)) ([Fig. 1](#)).

Fig. 1 Drawing titled “Park,” created by That Tha during a workshop in Hanoi in 2018.

In her drawing, That Tha draws a picture titled “Park” to represent the visibility of a girl with disabilities in the public space. The picture shows a disabled girl wearing a red shirt seating in a wheel-chair in the park. She is surrounded by her friend, land, and trees. There is a football net behind her. Through this picture, it seems that That Tha wants to express her desire to be visible in the public space where she can participate in everyday activities. Another deaf girl, Little Cat, draws her school with friends. Her use of bright colors in the drawing suggests her optimism for participating in an inclusive school ([Fig. 2](#)).

Little Cat draws a two-storey building surrounded by green trees and blue sky. There are many students in the schoolyard and in the classrooms. At the center of the drawing are the images of two students—one of whom is her self-representation marked by her own signature. It seems that she viewed her relationship with friends and schooling as something vital to the schooling. As she talks about her picture using her sign language: “[this drawing shows that] I hang around and play with new friends. Going to school in Can Tho is fun.” Here, she re-imagines schools as a space for connections and building relationships. This reflects the centrality of social relationship in schooling in their lives of Deaf girls in the community. At the same time, this space is politically constructed because it has been re-imagined from the perspective of a Deaf girl. In so doing, her Deafness is made visible to the school community through her drawing. Thus, the use of art for oppressed groups such as Deaf girls to imagine themselves and their sense of belonging helps to unsettle the regulatory practices of schooling by allowing these girls to re-imagine schools from their own standpoints.

In another Community-Asset Mapping workshop organized by our team members, participants were invited to locate their local spaces, including their homes, markets, schools, communities, and their friends’ homes. Using enlarged printed maps of their own communities so that they can identify their location, the participants used Lego figures in order to build their community such as homes, bridges, football field. Being able to involve in these playful activities, participants were invited to re-image their spaces within their communities and create connections with their locations ([Fig. 3](#)).

Fig. 2 Drawing “Students in my school” by Little Cat during a workshop in Can Tho in 2018.

Fig. 3 A Community-Asset Mapping workshop in Can Tho in 2018.

The playfulness of this activity offers an important opportunity for the girls to re-imagine their local space in relationship to others. The participants were excited to locate their space where they feel belonging. The community then became the most important social network for participants to re-locate themselves. They were then invited to identify their “gifts” as a part of their strengths for creating a more inclusive community. The girls chose to depict their strengths as being able to take care of their family chores, take care for their family members, being able to participate in social activities, having artistic skills such as drawing, or supporting their peers. In so doing, the participants were able to re-evaluate their own values and resist ableist values about disability which many of them may have internalized.

Discussion

The findings from TDKRA show that girls with disabilities are diversely represented through their class, gender, ethnicity, age, and disability. Their experiences are complex and multi-faceted. This was reflected in their understanding of disability, which is not monolithic but instead influenced by a variety of factors including how they have been treated by others. For example, some girls internalized ableism because of attitudinal and institutional oppressions which position as inferior to others. In the context of Agent Orange, some disabled girls saw their disability as a disease that needs to be cured, while at the same time highlighting the lack of

access to health care and social services. This reflects the challenges of disability communities in the Global South to resist ableist ideologies and practices that have been deeply entrenched and naturalized within the context of the Global South due to colonial and imperialist impacts.

In fact, while discussions on disability in communities in the South have emerged over the last three decades, they continue to be driven by the charity and medical approaches. Little has been discussed in relation to socio-political forces, which created impairment on bodies (Connell, 2011). This was displayed through the ongoing and intergenerational impacts of Agent Orange on disabled women and girls, and future generations which solidified medical perceptions that disability is a problem with the body (Nguyen and Stienstra, 2021). This context illuminates the ways in which imperialism caused impairments to Indigenous bodies through forms of governance which are epistemically and politically governed by the colonial structures and ideologies which create categories of difference (See also, Meekosha and Soldatic, 2011). This governing structure resulted in their constructions of class, race, gender, ability and disability (read as illness, disease, or abnormal bodies)—marked as deviant from the normative category of human beings as defined from a Western gaze and its Eurocentric ideologies (Smith, 1999).

At the same time, participants also demonstrated their strengths and capacities to contribute to their families and communities through the structure of their social lives. Some girls felt included in schools because others understood their struggles and supported them. In their visual productions, they drew their images in relation to friends, teachers, parents, schools, the classrooms, the playgrounds, along with cultural surroundings such as home, land, and the environment as spaces in which they feel connected. They also recognized the importance of engaging and creating collective support networks such as organizations of people with disabilities.

At the center of this epistemology is the concept of relationality. According to Indigenous epistemologies, relationality means “all things exist in relatedness” (Tynan, 2021, p. 601). Relationality speaks to how we relate to other human and non-human entities through our interdependence and mutual obligations. It does not only shape our ways of knowing and being but also shapes our ethical practice. Relationality rejects the idea of Otherness inherent in the hierarchical practice of the coloniality of being which positions the Other outside of the matrix of relatedness. Instead, relationality is conceptualized as “... that which brings us into existence through practice and process” and which such existence “is premised on the practice of our relational reality” (p. 601).

The concept of relationality could be used to understand non-Western epistemologies when conducting research in relation to disability in the global South. For example, Nguyen and Stienstra (2021) used this concept to demonstrate how non-Western epistemologies could generate a different system of thoughts which respect and value difference. Drawing on Ubuntu epistemology, they argue that we are always in a relational cycle with everything on the Earth (Mucina, 2013). We are connected to one another despite our differences. In fact, we depend on our differences in order to survive and sustain ourselves. Thus, while the disabled girls experienced intersectional forms of oppression, they also expressed a desire to provide reciprocal care for their family members, friends, and communities. For example, a disabled girl said that she wanted to find a job to earn money so that she could buy a house for her father before he dies. This reflects the ways in which social-relational care and cultural reciprocity are seen as central to their worldviews.

This socio-relational approach illuminates the ways in which educational research could be reframed from non-Western epistemologies and from the standpoint of girls with disabilities (Nguyen, 2016). A decolonial approach in social and educational research with girls with disabilities in the Global South requires that we critically engage with complex, and sometimes conflictual experiences of girls with disabilities in specific communities in the Global South as a form of countering the colonial imagination of difference and of reclaiming re-existence. It challenges epistemic injustice that has been framed as universal by the Western empire. This art of research requires us to begin the work of undoing and unthinking the coloniality of power which shapes how we come to know and learn about the Other (Ndlovu-Gatsheni, 2020).

Within this decolonial lens then, a participatory arts-based approach that engages with girls with disabilities is important because it reframes the colonial structure of research—that is, the ways in which research tends to be done *about* and not *with* or *from* the Global South. With basic filming skills and techniques, the girls were able to illuminate different aspects of unequal power relations which they endure in their everyday life. Their cellfilms suggest that the girls were well aware of the structures of inequalities in relation to disability, gender, and ethnic discrimination. In so doing, this approach worked to empower these girls to frame their own stories and reclaim their existence.

Conclusion

Writing from their locations as disability scholars situated in the Global North and South, Goodley and Swartz (2016) state that it is difficult for theorists from the Global South to engage in these conversations given the power of academics from the Global North. They argue that it is important for those generally excluded from these discussions to actively participate. However, it is not easy for the girls and young women with disabilities in the Global South to be involved in these conversations. In order to do that, we must interrogate epistemological privileges of Western and Eurocentric ideologies in knowledge production and redefine traditional approaches to qualitative research methods such as interviews or focus groups, which sustain power dynamics between Western researchers and participants from the Global South. Such approaches tend to marginalize and exclude disabled activists and scholars from the South from these conversations.

TDKRA offers an example for how research with girls with disabilities can offer an alternative approach for engaging disability and girlhood in the Global South through creative and participatory arts-based methods. The use of decolonial DS and participatory visual research empowered participants to re-imagine their spaces, relationships, and social identities in ways that challenge Northern narratives of disabled girlhoods' sufferings. In so doing, this chapter demonstrates how research *with* communities and participants in the Global South can be conducted as a form of "epistemological decolonization" (Quijano, 2007, p. 177), despite being imbued with multiple forms of struggles. Rather than offering a *universal* truth about the lives of disabled girls, decolonial DS is *an option* (Mignolo, 2018, p. 115) for educational research to resist coloniality; in so doing, it enables us to reclaim the voices, power, and identities of disabled and marginalized communities in the Global South.

Acknowledgment

I would like to thank the Social Sciences and Humanities Research Council of Canada (SSHRC) for its financial support. I thank Meysoon Amin for her thoughtful comments and assistance towards the completion of this chapter.

Youth electoral study	134
Political orientation influences	135
Informal curriculum: student governance	136
Political party orientation	137
Conclusion	138
References	138

Under the broad theme of diversity, democracy and social justice in education, the theme for this volume, it is possible to explore a vast array of sub-themes. This chapter examines identities and differences: political orientation through the vehicle of the school, the school curriculum and a national assessment of student knowledge and understanding of civic and political knowledge, skills and values. In the context of Australia, which can serve as an example to others, this analysis examines the role of the Australian Curriculum (AC) in influencing student political orientation and some measures of that orientation through the National Assessment Program Civics and Citizenship (NAPCC).

What does political orientation mean? By policy orientation we mean an orientation that characterizes the political thinking of a group or nation. Simplistically this can be left–right analysis, but more realistically there are four recognized political orientations - liberalism, conservatism, libertarianism and populism. In addition, political orientation can refer to the willingness to participate in politically, that is, do people exhibit a willingness to participate, or not, in what they consider to be political activities such as enrolling to vote and the act of voting itself (especially where voting is voluntary).

With youth the situation is different, evolving and more dynamic than with older groups as young people experience their transitional search for identity. Transitioning from child to teenager to adult in a relatively short time is, in itself, a potentially traumatic, incomplete experience. Overlaying an emerging political identity and orientation on this physical, emotional and psychological transition can complicate the process profoundly. Consequently many to most young people as they emerge into adulthood at the nominal age of eighteen years lack a political orientation or are trying to identify themselves beyond the influences of family and friends.

This chapter examines youth political orientation through the lenses of the school and what evidence we have of political orientations and where and how they are formed. In the context of Australian schools there exists a widespread understanding that teachers and schools will not deliberately promote any particular political party orientation/ideology. However, through the formal and informal curricula in schools, as well as the hidden curriculum (Print, 1993), there are multifarious opportunities for students to acquire, modify or consolidate a political orientation. And with senior school students especially (as most Australian senior students turn eighteen in their final school year), there are opportunities for young people to express those orientations in real forms such as voting in elections, joining political parties/groups and participating in political activities as an adult.

Age has not prevented thousands of Australian school students from demonstrating their political orientation on major international issues. In particular Australian students have joined international movements to protest about climate change and the role that the Australian governments have played. This form of political orientation is essentially non-partisan and in this case reflects widespread concern about the future of the earth. In late October 2021, for example, thousands of Australian school students took to the streets and the internet to demand action on climate change. The demonstration has been one of several over recent years on essentially the same theme that reflects, as some see, a lack of appropriate curriculum experience on climate change (Gobby and Varylan, 2021; also see <https://www.schoolstrike4climate.com>). Essentially a national student demonstration demanding action on climate change has occurred annually since 2018 and continued during the years of the pandemic.

Youth electoral study

Most information we have about student political orientation and identity comes from time-constrained surveys of young people or media, especially newspaper, coverage. Typically they are conducted at a politically-charged time and so enhanced expectations, actions and emotions ensue. There is a research study that was conducted in conjunction with the Australian Electoral Commission that sought to understand, among other issues, student political orientation.

The Youth Electoral Study (YES) was conducted nationally in Australia from 2004 to 2010 and included participants from all six Australian states and the two territories. A sample of 4758 secondary school students participated in the national survey were in the fifteen to seventeen age range while hundreds more were included in focus groups conducted in schools around the country. The approximately equal female and male students studied at government, independent and Catholic schools in metropolitan and rural locations around Australia with a slight emphasis in non-government school participation.

A key source of qualitative data came from the 16 electoral divisions (from 150 nationally) selected as research sites. These covered the main categories of electoral divisions – inner city, mid city-suburban, outer suburban, rural city, rural town and remote. Qualitative data were collected over a five year period with youth aged 17–25 in school and non-school sites, the latter including universities, TAFE, unemployed and employed groups. Reports of the project may be found on the Australian Electoral Commission's website under the heading "research." Other publications from the project are cited below and the reference list.

An initial key finding of the study was that all students knew a minimum of three issues related to themselves, their political orientation and voting. First was that voting in Australian elections, at least at national and state levels, was compulsory. Second that the voting age was eighteen years old. And third students knew that there were penalties involved in not voting when it was compulsory. They demonstrated little understanding of what the penalties were (mostly an inexpensive fine) or that they were entitled to register to vote when they turned seventeen years of age (AEC, 2009).

Most students had not made substantial political orientations in terms of political ideologies or political parties (Print, 2007; Saha and Print, 2010). Those who had were significantly influenced by their family, especially their parents, and were likely to be left of center in political orientation. This group tended to be the same very small percentage of students who could be considered politically active and hence displayed a political orientation.

The general lack of political orientation can be identified in the data on voting from the Australian Electoral Commission. Their data, for example, revealed that less than 10% of 17 year olds were registered to vote with the AEC and when they could vote at 18 years, nearly 60% actually voted. These percentages must be remembered in the context of compulsory voting from 18 years and with sanctions, and that all student knew the voting age was 18 and that voting in Australia, especially at federal and state elections, was compulsory (AEC, 2009).

Most students recalled that they found the study of government rather boring, if they could remember at all! (AEC, 2009; Saha et al., 2007). The last time most students studied about the government and the political system was in Year Nine or Ten when they were typically fifteen years old. Less than a quarter of students found the study of government interesting (AEC, 2009), reflecting a limited perspective on political orientation. However, "... students who could remember studying about the government, and also could remember the name of the subject and the year in which they took it, are slightly more likely to say that they will vote at 18, even if they did not have to." (AEC, 2009, p. 12). And the more interested students are in the political system and government, the more committed they are to voting.

A general feature of schools and the school curriculum in Australia was that students found extremely limited opportunities to learn about politics through the formal curriculum or school subjects (Print, 1993; Saha and Print, 2010). Typically after Year 10 students had extremely limited opportunities to study any aspect of political systems in the final two years of school (Saha et al., 2007).

The international research reveals mixed results for student political orientation and participation in school contexts and many studies are conducted through forms of survey research. For example the large (28 countries) IEA Civic Education Study (CivEd) investigated high school student knowledge, attitudes and behavior in school contexts especially where students participated in formal and informal civic education activities. The international study showed that formal civic learning, as measured by students' civic knowledge, was positively related to the likelihood that students intended to vote in the future as a form of political engagement (Torney-Purta et al., 2001). The later and larger (38 countries) International Civic and Citizenship Education Study (ICCS), however, found that while civic knowledge was positively associated with future electoral participation and legal protest, it correlated negatively with expected active political participation and illegal protest (Schulz et al., 2010).

An example of many studies at a national level is the review of American youth political research by William Galston where he relied on survey research to identify young Americans' civic/political knowledge and engagement. He noted, as have others such as the famous study by Putnam (2000), the decline in political engagement among American youth has been in decline, especially as measured by voting in elections. More concerning perhaps was that trust in government and most major social institutions was low and had remained so for some time. Further, despite large increases in formal education in the US, measures of political knowledge have remained flat for decades. Studies and commentaries by Campbell (2010), Harris et al. (2010), Geboers et al. (2015), and Barrett (2017), across different countries, reveal a similar results though in more recent years an increasing willingness of young people to demonstrate their political orientation through direct action.

Political orientation influences

The Youth Electoral Study found that parents were the most significant source for influencing student views on politics. They were more influential than siblings, peers, teachers, schools, community and religion (AEC, 2009). The study revealed that the characteristics of the parents (education levels, discussions on politics) were more important in determining whether the student intended to vote and their political orientation, rather than the other variables that could apply. "In the family, the extent to which the student learns about politics from their parents, and the extent to which the student claims to be influenced about voting by parents, both appear very important in affecting the student's commitment to voting" (AEC, 2009, p. 36).

Teachers were also influential though in a non-partisan way. Teachers in Australian schools are expected to refrain from espousing their personal political orientations and so to not influence student political orientations. Students stated that their teachers generally did not impart their personal political views though some were supportive of broader political agendas such as anti-Iraq war involvement.

Interestingly school type made a difference to student political knowledge and commitment to voting with students attending independent schools higher in both than catholic and government school students. However, when both attendance at independent school and family characteristics were considered, the influence of private schools on voting commitment disappeared, whereas with respect to political knowledge, it diminished, but remained important (AEC, 2009).

Students agreed by way of explanation, at the moment, they had little in the way of responsibilities to society and their family other than succeeding at school. Politics in general, especially if requiring a political orientation, was not high on their agendas. Of those who did express political orientations, most would classify themselves as supporting democracy, liberalism and were "left-wing" though only a handful had joined a political party (AEC, 2009).

However, there are issues that students feel very strongly about and are prepared to take direct action about, with resulting major demonstrations held in school hours. These are instances of political orientation in practice though they are rarely aligned with any political party or political ideology. For example, over the past two decades there have been major student demonstrations against Australia's participation in the Iraq war, about support for climate change action, about government responses to the global financial crisis, and recently demanding action against domestic violence, child abuse and the need for consent (<https://www.schoolstrike4climate.com>).

What inspires such actions and movements is a widespread concern among many young people about their future and the future of the world. They have, though various sources including mainstream media, social media and school experiences, come to understand the seriousness of these issues and the associated need to speak up and democratically protest about perceived inaction. Interestingly those students who protested in recent years, have now come of voting age and in the most recent Australian general elections the conservative government was soundly defeated, producing its worst election vote in decades. A key issue in that election was how the government appeared to be not listening carefully to concerns about issues such as climate change.

And what role have schools played in these actions? In the student strike against climate inaction by governments most secondary schools in Australia were remarkably supportive. Many schools "allowed" students to attend demonstrations, some even supported by teachers, while others ignored student non-attendance on a school day. The existing Australian Curriculum, employed across all Australian 9450 schools (though with some modifications in a few states) does address key issues that concern students, their future, the future of Australia and the world. The informal curriculum in schools provides a further, perhaps more tangible, opportunity for enhancing student political understanding and engagement.

Informal curriculum: student governance

In the literature on the informal curriculum discussion has ranged about the effectiveness and impact of activities identified as within the informal curriculum such as student governance, especially student councils (Print, 2009; Print et al., 2002; Saha and Print, 2010). YES identified a relationship between participation in student governance and political engagement which, in turn, requires a political orientation. The study data made it clear that participating in school elections had a beneficial positive effect on both electoral enrollment behavior and the voting intentions of secondary school students. "For students who are 17 years old, the relationship between voting and standing for office are much more strongly related to intention to vote than for actually having enrolled..." (AEC, 2009, p. 32).

The Australian study found that students who participated in school elections were more knowledgeable and prone to engage in the political realm (Saha and Print, 2010). Consequently these students developed a political orientation either overtly and directly or indirectly and unknowingly. YES found that voting in school elections was positively related to feeling prepared to vote as an adult, to being committed to vote when 18, to political knowledge, and to engagement in forms of peaceful activism. The more active role of running for student government office was further related to political knowledge and participation in peaceful activism. These results reinforced the findings of adult retrospective studies, showing that participation in school elections served as a beneficial experience in the preparation of students for life as an active adult citizen with a political orientation.

There is a body of literature that argues that by experiencing various political activities, and acquiring political knowledge, a person acquires a self-identity of which political orientation is a necessary part (Barrett, 2017; Geboers et al., 2015; Harris et al., 2010). It is, however, a complex and messy process, but one where school experience can contribute. For example, by participating in a school election, a student would self-identify as a "voter," which makes it easier to vote again later in life as a political orientation has been established. Furthermore, students who vote, or run for office, in school elections begin to think that they can make decisions in school settings, and that they possess power to determine, at least in part, their own political environment in the future, thereby consolidating a sense of political orientation. At this point nascent party political orientations may also become apparent.

Similarly, in a significant study in the United States David Campbell (2010) identified that a sense of civic duty could spring from one's early influences such as the school. The degree to which people feel a sense of civic obligation, including a political orientation, Campbell claimed, stems, in part, from their adolescent experience. The socialization process in the context of a community with strong civic norms would lead people to be civically engaged in adulthood and hence manifesting a form of political orientation. Campbell (2010) demonstrated how the civic norms manifest within the high school would impact on individuals' civic involvement and political orientation even a decade or after those individuals had completed secondary education.

In conclusion the Youth Electoral Study provided evidence to support the notion that school elections may be the "cradle" of democracy, since it is here that students experience a fundamental democratic practice and early signs of political orientation (Saha

and Print, 2010). YES demonstrated empirically that students who do vote or run for office, are also more prone to feel prepared to vote as adults, to actually intend to vote, to know more about politics, and to have already experienced some form of political activism, such as attending rallies or letter writing (AEC, 2009; Saha and Print, 2010). These behaviors represent forms of political orientation both in a general sense of orientation and in the sense of political party orientation.

Political party orientation

In western democracies political parties appear to be a fixed feature of the political landscape. This reflects the democratic world where governments are based on political parties who control a majority in parliaments. Political parties play a role in identifying political philosophies and policies that affect the political orientation of young people. Examining the political orientation of young people toward political parties is important if one wants to study young people and voting. In Australia we are interested to identify when young people vote for the first time that they know enough about political parties, and about their own personal philosophy, to make a reasoned choice in their voting. Since parents are the most important early political socialisers of their children, we need to know how much of young persons' political party orientation is related to the leanings of their parents. Further we want to know whether the political orientation makes a difference in young people's voting intentions.

Using the data from the YES research of young Australians it is possible to identify their nascent political orientation. In very small numbers the political orientation of young people is clear and unequivocal. In Australia voting is compulsory for all citizens aged eighteen years and older. So if young people are required to vote it is reasonable to expect that they will begin to differentiate between the parties as they approach voting age. Yet slightly more than half of the young people in the study did not feel confident in their knowledge of political parties to vote in a national election (AEC, 2009).

Youth political orientation is acquired through multifarious sources over time so that by the time students are in the final years of school in Australia, and are able to vote, they invariably exhibit some form of political party orientation however minor. In the YES survey nearly half the students identified a political party orientation while the remainder were unsure which political party met their political needs (Saha et al., 2007). And those who indicated a political party orientation were more likely to vote in the future (Saha et al., 2007). In terms of political parties and party differences, it is clear that the Liberal/National parties enjoyed the highest level of voting commitment by the youth who identify with them, followed by the Labor Party and the Green Party. What is more significant in the Australian context, is how voting commitment declined for young people who have either rejected a party identity, or do not, for whatever reason, identify with any party. Only one-third of these students would vote in the hypothetical situation if they did not have to (Saha et al., 2007).

Why do young Australians demonstrate a political party orientation? In the YES research many students named the same political party orientation as they perceived their parents favored. This outcome was facilitated through family discussions and comments about political parties, figures and policies in daily interactions. A sense of family "inheritance" of party identity can therefore be identified and can be explained in many ways, for example by means of political party cues that young people pick up from their parents, or through the perceived link between the social status of the party and that of the family and even the school.

The formation of party identity among young people, that is their political party orientation, will continue as long as the Australian political system is based on party politics, a Westminster parliamentary government, and voting focused more on political parties than on individuals. The YES research has demonstrated a high degree of party inheritance attributed to the family, though other factors at play. They study identified that more than half of the young people did not name a party or demonstrate clear political party orientation. Further, it appears that some young people deliberately aligned themselves with a party other than that of their parents (Saha et al., 2007).

In their national study of older youth participatory practices and political knowledge Reichert and Print (2018, 2019) used items drawn from the National Assessment Program Civics and Citizenship (NAPCC). The study utilized appropriate items on political knowledge and attitudes and found that young people's commitments to traditional forms of political participation were declining, which challenges arguments supporting political orientation, particularly political party orientation. By contrast, political orientation of young people was demonstrated by engagement in socio-political forms of participation around key and pressing phenomena such as climate change which were not identified as political party oriented (Gobby and Varylan, 2021). In recent times these issues have led to widespread student action such as school student strikes in favor of greater direct political action to combat climate change (<https://www.schoolstrike4climate.com>).

Significantly their study found participation in party-political activities appears to require high levels of efficacy and motivation (Saha et al., 2007). Socio-political activities might be more intrinsically rewarding than party-political activities that often require stronger personal investments for young people. This study suggests that higher levels of knowledge are associated with more frequent exposure to political news on television only among highly educated respondents who report average or below average interest in politics. This association might reflect knowledge that is absorbed while watching entertaining news as this association only appears among highly educated young adults (Saha et al., 2007).

The NAPCC itself, a national sample assessment of school students in Years six and ten, identifies some items in civics and citizenship that require students to reveal their general political orientation and to a minor extent their political party orientation. A commonly agreed theme of NAPCC has been that civics and citizenship education aims to enable students to become informed and active citizens. From its inception, NAPCC has consequently collected data on students' knowledge and understanding of civics and citizenship content as well as the attitudes, values and behaviors that relate to participatory citizenship. In turn these data provide an

insight into student political orientation. For example, a key goal of the NAPCC is to ensure students develop knowledge, understanding and appreciation of the values, principles, institutions and practices of Australia's system of democratic government and law, and the role of the citizen in Australian government and society. This goal facilitates an understanding of student political orientation.

In terms of a general political orientation and the knowledge required to support it the report found that at the national level in 2016, only 38% of Year 10 students achieved at or above the proficient standard. This standard is what would be expected of a student to achieve and the 2016 result for Year 10 students is significantly lower than the percentage achieved in each of the two previous cycles (44% in 2013 and 49% in 2010) (ACARA, 2017, p. 41). Surprisingly the Year 10 NAPCC data show at the national level that political knowledge, which is considered a necessary precursor to political orientation, more than 60% of students did not achieve at the proficient standard. This is a sad indictment of preparation for becoming an informed adult citizen in Australian democracy.

Students in 2016 also tended to have higher levels of interest in civic issues, greater belief in the value of civic action, and stronger expectations to engage in civic activities in the future, particularly compared to 2010 (ACARA, 2017, p. 117). Interestingly 63% of Year 10 students identified supporting a political party as an important citizenship behavior, while only 51% supported discussing politics. However, addressing issues stated above, such as protecting the environment, promoting human rights and personal efforts to protect natural resources received around 80% support (ACARA, 2017, p. 142) and in the process demonstrated evidence of a general political orientation.

Conclusion

The concept of political orientation among young people is complex and dominated by two perspectives. First a general understanding of political orientation that reflects the general level of interest and participation in politics. A second perspective considers young people's political party orientation and the degree to which, if any, they are involved in political party activities. Generally Australian school students have demonstrated substantial general political orientation but relatively low political party orientation. On specific issues, however, as the NAPCC data reveal, young Australians demonstrate clear evidence of political orientation.

Between the two key perspectives there is increasing evidence of student political orientation toward specific phenomena or key issues about which young people have strong views. The strength of these views may involve participating in general political behavior such as demonstrations and the use of social media to influence governments and the community in general. For example, many young people have evidenced very strong views and behavior on perceived federal government inaction on climate change in Australia. Mostly this political orientation is general in nature though targeted to a specific issue rather than follow political party policy and ideology. However, there is evidence that a small number of young people in schools do exhibit political party orientation though this is not promoted or endorsed by the school.

Introduction

This entry provides a synthetic overview of (historically-inflected) visions and practices of global/international education, oriented to the domain of k-12 schooling in the 21st century. Reflecting the English-medium literature/scholarship examined (and my social/epistemic location as a White Anglo-Canadian researcher of, and practitioner in, global/international education), the perspective offered is Anglo-Western. It is important to note, however, that non-Western and non-Anglo regions have shaped/co-constituted “Western” conceptions of global/international education; moreover, across most parts of the world, Western modes of schooling (and being) have been dominant referents for educational initiatives (i.e. “education for development,” “study abroad” ...), under the broader sweep of 20th century Euro-American hegemony. Therefore, this Anglo-Western centered conception of global/international education is informed by, and will likely have significant reverberations with, global/international education in multiple societal and educational jurisdiction contexts. Finally, in terms of the literature cited in this entry, I did not attempt a neutral search strategy to filter the available literature. Rather, toward offering a coherent and compelling (if partial) accounting of global/international education, I purposefully leaned into my own reading bibliography and past writing, as well as into my experience as a researcher and educator in the area of global/international education.

Given the thematic of this volume, the entry attends to the idealist visions of global/international education, such as educating for “international understanding” and “planetary consciousness,” and how these visions (are to) find expression in k-12 school practices. As will be explicated in the next section, *global* education and *international* education (among other terms) can be differentiated. These differences are important and need to be considered in contextually-sensitive ways. *Nevertheless*, under interpenetrating colonial histories ascribing countries as “developed” or “under-developed” and more recent processes of (neoliberal) globalization and the associated global educational policy convergence (Rizvi and Lingard, 2010), which includes the rise of global/international education as an “expedient” (Tarc, 2013a), there are *converging* pressures on, and thereby overlapping uses and tensions of, global/international education in these early decades of the 21st century.

Further, the various terms/signifiers of global and international educational discourse often work *performatively* as partly “floating signifiers” (Manion et al., 2011; Tarc, 2019), referring to an overlapping set of features ascribed to global and international education. In very abbreviated terms, these features are founded on the historical/deeper aims and functions of (1) a border-crossing/inter-national and/or holistic/planetary orientation and (2) an idealist pedagogical vision/belief that bringing in or having this supra-national(ist) orientation can support education’s normative goal of making a “better” (less violent, more egalitarian, ...) world (Hanvey, 1976; Heater, 1980; Tarc, 2009). In terms of the *education* in global/international education, liberal-humanist and child-centred pedagogies, reflecting the progressive internationalist viewpoints of advocates of global/international education, have been the dominant forms (Hughes, 2012; Pike and Selby, 1988; Tarc, 2009); there have also been calls for more *critical* orientations of global/international education such as the Marxist-inspired “peace education” of the 1970s (Heater, 1980) and more recent, critically-informed articulations of “global citizenship education” (Abdi et al., 2015; Andreotti, 2014; Andreotti and de Souza, 2012; Lapayese, 2003; Marshall, 2011; Pashby and Sund, 2020; Stein, 2021; Tarc, 2012, 2015). Rather than prioritizing a semantic analyses on the different terms used or on the boundary making of academic discourse communities, the purpose of this article is to provide an historical overview and schema to interpret the multiple manifestations of global/international education more conceptually (see also Tarc, 2019). Accordingly, this entry digs into the deeper aims and evolving tensions as (partly) constitutive features of K-12 global/international education converging in the early decades of the 21st century.

Given the *shared* core impulses and features, as well as the slippages of the terms used in educational discourses, I take “global/international” as an umbrella term, inclusive of a set of other terms, such as “global citizenship education,” and

education for “intercultural competence.” Further, for readability, I shorten “global/international education” to “global education” and use the acronym GE when referring to global education as the global/international education *umbrella* term. Following the next section discussing terminology, where I differentiate some of the distinctive inflections and uses of the variant terms, in this entry GE broadly signifies a whole set of older and newer terms related to global and international education. Although GE has a longer history (Good, 2020; Hill, 2002; Méras, 1932), this entry considers the global education trajectory over the last fifty or so years. Additionally, the focus on the k-12 level of schooling also has guided the selection of literature informing this entry.

Finally, the discussion moves from a synthetic and historically-informed overview to a postulation of the converging core flashpoints and tensions of global/international education as they have evolved into the contemporary moment. These flashpoints/tensions include the following: the tensions between strategic and dedicated cosmopolitan sovereignties and subjectivities; *how* GE can make a difference, *educationally*; and how this *difference made* relates to the project of making a “better world.”

Terminology and trajectories: distinctions, overlaps and percolating flashpoints

Reflecting heightened transnational flows and interdependencies, the adjectives “global,” “international,” “intercultural” and “cosmopolitan” have become ubiquitous across many educational discourses and levels of schooling. The purpose of this section is to first summarize key semantic distinctions primarily between “global” and “international” education. The second objective is to illustrate a kind of convergence around their performative meanings and uses. This convergence allows for a “frame” for illuminating, researching and potentially steering variants of GE across multiple contexts (Tarc, 2019).

International education

In Tarc’s (2007a) conceptual genealogy of the “international” in the International Baccalaureate, he finds that the *international* in international education carries both a literal and idealist meaning (see also entry *International Baccalaureate: Meanings and uses in a globalizing world* in Elsevier’s companion volume “Globalization and the Geopolitics of Education,” Tarc, 2022). On the one hand, inter-national education, *literally* signifies educational activities that cross or connect up across national borders. Here we have the example of students who “study abroad.” Yet the actual curricula they study may be a wholly national or state curriculum. On the other hand, international education, at least for the last century, has also signified an outward-looking, progressive and child-centered education for “international understanding” that seeks to move beyond a nationalistic frame, toward the making of a “better world” in a context of heightened interdependencies (Tarc, 2009). Here the “international” in international education brings both an international-humanist orientation to education as well as a pedagogical methodology that is progressive and child centered. This conception of the core visions of international education aligns well with Stier’s (2004) depiction of three foundational ideologies of the internationalization in *higher education* (IHE) as “instrumentalism,” “idealism” and “educationalism,” and with Hill’s (2002) differentiation of the “ideological,” “utilitarian” and “pedagogical” rationales for international education in the *field of international schools*. In real world manifestations of international education, the literal and idealist/aspirational agendas become entangled (Tarc, 2009). For example, the context of crossing geographic borders and encountering the unfamiliar can provoke the kind of international understanding to which the idealist agendas are oriented. So to, those individuals inclined to international and intercultural understanding may be more open to, and involved in, cross-border activities (Tarc, 2013a).

To differentiate international education from global education, it is important to emphasize how, semantically, international education represents an intervention to, or departure from, what can be called national education, or education within a nation-state-centric frame. And, again, the intervention can be more of an *idealist* challenge to a nationalist/parochial education or it can be more about mobilities—teachers, students and educational programs that “travel” or connect *across* political borders. In the first sense, international education is to open up learners’ awareness of, and responsibility toward, more distant others in an interconnected, interdependent and fraught world. Developing a “world history” syllabus, re-vizing ethnocentric textbooks and “bringing the world” into the classroom through visual aids are all 20th century examples (Good, 2020; Tarc, 2009).

In the second sense, international education can refer to any kind of education that takes place outside of one’s country or that comes into one’s country from the outside. In the “developing country” context, international education often refers to a “Western education,” that can advance social mobilities under the conditions of global capitalism and the hegemonic status of colonial languages (especially English). And so coming to “study abroad” in a university in the West, irrespective of the curriculum or learning, represents “international education.” And providing (qualificatory and credentializing) systems that supports the mobilities of students, such as the Erasmus program for higher education in Europe, or the International Baccalaureate Diploma Program as a secondary school leaving diploma, also represent international education. And again, when these mobilities happen in educational contexts, the more idealist notions tend to surface. For example in the context of pragmatic IHE (i.e. for revenue generation), as Western university instructors respond to the backgrounds and needs of incoming international students by internationalizing curricula or employing culturally-relevant pedagogy or responding to students’ experiences of discrimination, the *idealist* goals of supporting intercultural dialogue, respect and understanding (or in today’s vocabulary—“diversity, democracy and social justice”) reveal themselves.

Global education

The modifier “global” in global education, at least in theory, is less tied to the category of the nation and to *political* borders, and signifies more “systems” or holistic approaches privileging “planetary” perspective, local-global relations and transdisciplinarity (see below). Global education often emphasizes a transdisciplinary or thematic approach to curriculum, appropriate to engaging inter-connected issues and challenges; accordingly it also tends to favor child-centred, “constructivist” pedagogical approaches. The “global” thus more loosely refers to learning about the “wider world” as opposed to the “international” which takes the level of the nation-state (within an international order) as its point of departure. Some educationalists place global education more centrally in the domain of k-12 schooling and international education in the higher education domain (Pike, 2015); this differentiation has likely been precipitated by the internationalization of higher education movement, largely driven by the recruitment of high-tuition paying international students and the branding of universities as “world class,” which has accelerated from the 1990s into the 21st century under neoliberalisation processes (de Wit and Altbach, 2021; Knight, 2003; Tarc, 2013a).

A number of authoritative typologies and reviews of global education are instructive for understanding contemporary meanings and uses of GE. These late-20th and early-21st century conceptions of global education illustrate distinctive emphases from international education, but, at the same time, there is much overlap. Although I do not by any means provide a comprehensive listing, the following small set of influential accounts well illustrates the main contours of *global education* as represented (primarily) in the Anglo-West. Robert Hanvey’s (1976) *An Attainable Global Perspective* continues to be an influential framing of global education by global education scholars and practitioners (Hicks, 2003). Hanvey (1976) identifies five dimensions of awareness and knowledge that are “requirements” for a global perspective as follows:

- *Perspective Consciousness*, underscores the need to recognize the concept that everyone’s perspective is shaped by subtle influences and that others may have different perspectives.
- *State of the Planet Awareness*, examines the problems and solutions for increasing the ability of individuals to intelligently interpret information about world conditions.
- *Cross Cultural Awareness*, describes the different degrees of cross-cultural awareness and the necessity to reach a stage beyond empathy where one has the capacity to imagine oneself in a role within the context of a foreign culture.
- *Knowledge of Global Dynamics*, analyzes the world as an interdependent system where the issue of growth may be the predominant contemporary problem.
- *Awareness of Human Choices*, emphasizes that increased global perspective will require difficult value decisions about the solutions to our world problems. (my emphases, p. i)

Derek Heater’s (1980) *World studies: Education for international understanding in Britain*, provides a comprehensive accounting of the post-WWII “World Studies” trajectory in Britain. Heater’s definition of “world studies,” as his overarching term, is stated as follows:

Studies that draw upon a number of disciplines, mainly in the field of the social studies, whose subject matter is not limited by any geographical restrictions, taking the whole world as the source of material for investigation. Programmes of study maybe interdisciplinary and holistic in organisation or composed of separate subjects or fields of study whose syllabuses are constructed on the basis of global scope. The selection of material from the great potential range may be determined by any or all of the following organizing principles:

1. Societies and cultures other than those of the student.
2. Issues and problems of current significance whose impact extends beyond a single continent.
3. The interrelatedness of life, events and institutions beyond the confines of any nation. The objectives of these studies include an appreciation of the need to view many issues in a global context, the enhancement of tolerance between peoples and a desire for a more just world society. (p. 5)

Heater wades through the “jungle of nomenclature” (p. 27) to identify and unpack six major strands of or variations to his generic term “world studies,” as follows: (1) the “traditional” education for international understanding [often termed “international education”]; (2) global education (favored in the US), (3) peace education, (4) development studies, (5) environmental education and (6) multicultural education. Heater provides a comprehensive UK-centred accounting of these various strands and unpacks their educational implications and manifestations. His book offers a weighty accounting of global/international education in the *pre-neoliberal* globalization era.

David Hicks (2003) provides a useful and more contemporary review of the UK global education movement across “thirty years.” He claims that the UK “variant of global education” (p. 266) began with the “world studies project” under Robin Richardson’s lead. From Richardson’s work, the “World Studies 8–13 project” became a “highly successful national curriculum project” that developed five themes for classroom inquiry, namely: “(i) ourselves and others; (ii) rich and poor; (iii) peace and conflict; (iv) our environment; (v) the world tomorrow” (Hicks, 2003, p. 267). Also influenced by Richardson, Graham Pike and David Selby “further developed the conceptual map of the field” (p. 267). In their *Global teacher, Global learner*, Pike and Selby (1988) first mark out “four dimensions of globality” as the *spatial*, the *temporal*, the *issues* and the *human potential* dimensions (cited in Hicks, 2003, p. 267). Additionally Pike and Selby (1988) adapt Hanvey’s model in their articulation of five “aims for global education” as follows: “Systems consciousness,” “Perspective consciousness,” “Health of planet awareness,” “Involvement consciousness and preparedness” and “Process mindedness” (cited in Hicks, 2003, p. 268).

Ultimately, Hicks states his belief that “it is possible to identify the core elements that are required for any endeavor to be labeled as global education” (p. 270). Hick’s model echoes the dimensional model of Pike and Selby and is condensed into the following “core elements:”

1. *Issues dimension*—This embraces five major *problem* areas (and *solutions* to them): inequality/equality; injustice/justice; conflict/peace; environmental damage/care; alienation/participation
2. *Spatial dimension*—This emphasizes exploration of the *local–global connections* that exist in relation to these issues, including the nature of both interdependency and dependency
3. *Temporal dimension*—This emphasizes exploration of the interconnections that exist between *past, present and future* in relation to such issues and in particular scenarios of preferred futures
4. *Process dimension*—This emphasizes a participatory and experiential pedagogy which explores differing *value perspectives* and leads to politically aware local–global *citizenship*. (p. 271)

Global educators will recognize the concepts, dimensions and issues represented in Hicks model. It is fairly open and able to accommodate specificities across time and space, such as new forms or “inequality/equality” or “alienation/participation.” The “process dimension” continues to be particularly salient for GE as does the desire that global education pedagogy “leads to politically aware local–global citizenship.” What is meant by “politically aware local–global citizenship,” in different spatial contexts and from different theoretical perspectives, is a key flash-point emerging in recent writing in GE, and one to which I will return.

Before continuing this skeletal trajectory of *ideas of global education* it is worth noting that such conceptions are formed *out of* the conditions of policy-making, and *from* the on-the-ground experiences and practices of educators. In the first sense, the larger political and cultural debates (such as the *A Nation at Risk* trope emerging in the early 1980s in the United States) enable and constrain attention to, and resourcing of, GE (Tarc, 2009). So global education *policy making* has been formed by these larger politics (Heater, 1980; Tye, 2014). Thus, one can see the rise and fall of GE policy initiatives across time in parallel to the ebb and flow of countries internationalism (Tarc, 2009). GE practices and research studies, in turn, are also enabled and constrained by the larger socio-political contexts and accompanying policy reforms.

This entry does not detail the growing (libraries of) resources and prescriptions for k-12 global education (Tye, 2014) or map how global education is taught in k-12. But, it is important to understand the *experiential* and *practice-based* foundations of GE. Enduring commitments to GE and practices of individual “champion” educators in k-12 and higher education settings have directly informed, and continue to inform, the models and heuristics of GE developed. In terms of lived experience, many of the influential 20th century global educator scholars, as well as current theorists of global citizenship education, have themselves articulated how their experiences—of cross-cultural immersion, encounters of war and injustice, study and teaching abroad, Peace Corp, North-South (colonially-inflected) relations—have informed their commitments to and scholarship in GE (for example, Becker in Kirkwood-Tucker, 2018; Jefferess, 2008; Merryfield, 2018; Selby, 2008; Tarc, 2013b). Tang and colleagues’ (forthcoming) analysis of the “making of distinguished global scholars” in the domain of US.-based global education is particularly instructive.

Kenneth Tye’s (2014) *Global education: A worldwide movement. An update*, brings us closer to the contemporary moment and attempts to illuminate the global education movement on a wider scale. Tye provides an update on his previous research study surveying how global education is understood and taken up more globally. In the original study (Tye, 1999), he encounters a number of limitations in gathering the data, but manages to collect at least some data from 24 countries. Beyond the non-comprehensiveness of the data collected, Tye (2014) remarks on the conception that “global education” is tied to Western coloniality and that some countries in the South might have opted out of participating in the original study for this reason. On his original study he reports (Tye, 2003):

The major finding from my study was that throughout the world, schooling is still seen as a major force in the building of national loyalties. This is true despite the inexorable movement toward regional and international cooperation and the growing interconnectedness of the global systems ... (p. 165)

In his update (2014) to “assess the [current] state of the field,” Tye adapts his methodological approach. He explains as follows:

Rather than repeat the cumbersome methodology of the previous study, and because there now is a substantial international literature about global education, it was thought that a meta-analysis of the field presented in the literature might better suffice to describe what is currently happening in the world with regard to global education. (p. 855)

In his synthesis of global education “as a world wide movement,” Tye presents a synthesized definition of global education and identifies three main “barriers” to “the advancement of global education.” On the former, he writes:

To begin with, and while there are some disagreements, there is a definition that is felt to be suitable by a large number of global educators, as follows:

- Global education involves learning about those problems and issues that cut across national boundaries, and about the interconnectedness of systems – ecological, cultural, economic, political, and technological.
- Global education involves perspective taking – seeing things through the eyes and minds of others.
- Global education involves taking individual and collective action for social justice and the creation of a better world.

In addition, it is generally agreed that issues to be considered are ecology and environmental studies and education for sustainability; human rights education; education for peace and conflict resolution; and multicultural/intercultural education. (p. 867).

Tye’s fairly comprehensive, and still relevant, definition/conception of global education will be familiar across multiple contexts. It includes (1) knowledge and awareness of international issues and of the interconnectedness of systems, (2) perspective taking and (3) investments and action toward making a “better world.”

From this short and partial review of 20th to 21st century global education discourse, one can see, again, how each author cited adjusts their definition in relation to previous definitions. One can see how key constructs, such as Hanvey’s (1976) “perspective consciousness,” become slightly altered or becomes subsumed as another category or meta-term. Thus, it is evident that these definitions overlap considerably (and with those of international education), despite changing vocabulary and evolving iterations of high-level frameworks. Conceptions of global education find altered emphases over time, reflective of the changing understandings of the world, of the nation-state and of education. One such turn-of-the-century change has been a more *overt* emphasis on social justice and demands that education more directly “make a difference” (Tarc, 2012). Reflecting on his edited collection, *The Bloomsbury handbook of global education and learning*, Douglas Bourn (2020) remarks:

GE ... can mean a number of different things but what ... [brings] them together here has been a common thread of *seeking global social justice*, of challenging dominant new-liberal orthodoxies and offering different solutions and ways of working. (my emphasis, p. 453)

While this reflection is based upon the individual foci of the handbook’s contributors, it is also the case that in GE discourses, there has been an intensification of rhetorical commitments to social justice, equity and “acting to make a difference”; this emphasis on equity reflects the larger mainstreaming of progressive discourse under liberalism and some versions of neoliberalism (Fraser, 2019; Tarc, forthcoming, 2015, 2012; Tye, 2014). Despite this more recent *explicit* emphasis on (global) social justice, one can also identify in 20th century global education discourse, an *enduring* set of topics, themes, analytic registers and orientations for education to be more outward looking, relevant and less parochial; to be grounded in understandings of evolving worldly conditions and human development; and, to be in pursuit, if circuitously, of making a “better world.”

In Heater’s (1980) and Hanvey’s (1976) high-level models, there is no explicit mention of pedagogy or the *process* by which learners are to acquire a “global perspective” or *study* “world studies.” One would have to look further in these texts to encounter their conceptions of pedagogical processes and tensions. Heater (1980) discusses, for example, how GE advocates had to navigate the effects of the larger culture wars periodically criticizing GE as indoctrination, unrigorous and/or unpatriotic. These criticisms and debates endure into the present day with evolving dynamics (Bunnell, 2012; Chalfant and Samuels, 2020; Veugelers, 2007). On the other hand, Selby and Pike (2000) and Hicks (2003) include the “process dimension”—“participatory and experiential pedagogy” (Hicks, 2003, p. 171)—as a key tenet of global education. This process dimension continues to be strongly accentuated by most contemporary advocates of global education as Oxfam, the International Baccalaureate Organization, Unesco, etc. The question of process or pedagogy is important in the sense that models, typologies and prescriptions for global education have to be translated and re-contextualized in school sites. The more ambitious goals of progressive or critical GE require much more than consolidating the content to be digested or following a new curricular recipe. In this sense GE frameworks are more entry points and guiding principles than “teacher proof” lessons. Alongside the “main barriers” to global education that I turn to next, an additional barrier is one of school pedagogy, how the progressive and critical idealist goals of GE are to manifest in classroom teaching and learning. I consider this additional tension or flashpoint in the discussion section.

The “main barriers” to global education of “nationalism, neoliberalism and confusion of meaning” that Tye (2014, p. 867)—among multiple others (Goren and Yemini, pp. 180–181; Jones, 2000; O’Sullivan, 1999; Pike, 2000, 2015; Tarc, 2013a, 2009)—identifies, are also instructive to understanding the current state of GE. “Confusion of meaning” is a concern; it can impede both inter-cultural/societal dialogue, inter-disciplinary collaboration as well as global education policy and curriculum development; however, having a fixed definition seems neither tenable nor desirable. Instead, one can identify and work with multiple, overlapping conceptions of global education *analytically* as a starting point for discussion and curricular development. In this entry, and elsewhere (Tarc, 2019, 2022) I have offered one type of approach.

In the end, new models, typologies or terms such as “glocal” can sometimes work as productive shortcuts to (in this case) signify the inter-penetrating relationality of the global and the local and how the national level mediates (or not); however, given the ongoing necessity of translations across linguistic, cultural and geographic contexts and ever-changing global dynamics we end up returning to more core, but also not fixed, concepts as the “global” and “national” always in need of further scrutiny (see also Sassen, 2006, 2009, on dis-assembling meta-categories). For example, both the Co-vid 19 pandemic and the emerging invasion of Ukraine are altering thinking on the *qualities* of the porousness of political borders and of the “post” of post-Westphalian

geopolitical order. In my perspective, the other two barriers Tye identifies are perhaps more salient and particular to GE; they are discussed below.

Variants of GE

Before concluding this section on terminology, it is worth mentioning a few other streams or “vocabularies” of GE. First, coming out of more psychological-based “adaptation” studies is the stream of “intercultural competence” that has generated considerable literature (Bennett, 2015; Savicki, 2008), including critique (Dervin et al., 2012; Marginson and Sawir, 2011). This stream has found traction in contexts of postmodern performativity (Lyotard, 1984) privileging, in this case, the *measuring* of “intercultural competence” (Hammer et al., 2003). Educating for “intercultural competence” can be seen as an antecedent to educating for “global competence,” which is the term of choice in the OECD’s recent, and influential intervention (Engel et al., 2019), *Preparing our Youth for an Inclusive and Sustainable World: The OECD PISA Global Competence Framework* (OECD, 2018). By including “global competence” within its Program for International Student Assessment (PISA) regime, the OECD brings a “harder” modality to the “soft” transnational governance of GE (Tarc, 2021). Another influential transnational actor in global education, the IBO, which has expanded well beyond its genesis in the international school sector (Tarc, 2009; Resnik, 2012), centers its pedagogical aspirations on the development of “international mindedness” (Hacking et al., 2016; IBO, 2017; Singh and Qi, 2013).

Coming out of the resurgence of cosmopolitanism in academic discourses in the 1990s (Cheah and Robbins, 1998) “cosmopolitan” has also become a modifier—of education, of the teacher and of learning—under heightened transnationalism (Hansen, 2011; Luke, 2004; Rizvi, 2009; Tarc, 2013b). Although a contested concept, “rooted” or “vernacular” cosmopolitanism can be understood as upholding a common and relationally-constituted world, without neutralizing difference or cultural rootedness (Appiah, 2006; Hall, 2002) nor over-privileging the nation-state level in determining human relations and subjectivities (Rizvi, 2009). In this sense, a cosmopolitan lens is potentially more nuanced for studying educational processes and effects in a more globalizing and globalized world. Rizvi’s (2009) discussion of the “epistemic virtues” of historicity, relationality, criticality and reflexivity as pedagogic modes of “cosmopolitan learning,” (CL) foregrounds the learner’s developing awareness of their “situatedness” in a hyper-connected and uneven world; CL represents a promising version of a (phenomenal and ethical) pedagogy for GE (Tarc and Budrow, 2022).

Additionally, versions of multicultural education and citizenship education are being re-articulated to respond to heightened global migrations and cultural flows and connections (Abu El-Haj, 2007; Banks, 2017; Davies et al., 2005); contributions in James Banks’s (2017) edited collection, *Citizenship education and global migration: Implications for theory, research, and teaching*, are salient examples. There are also important cautions on conceptions of scaling up citizenship and “responsibility to others” to the global scale, as well as critiques of conflating multicultural education and GE (Davies et al., 2005; Idrissi et al., 2020; Rorty, 1998).

Most broadly, there is a coalescing overlap between more justice-oriented global education (as stated previously) and less nation-state-centric conceptions of teaching for diversity, equity, anti-racism and social justice (see for example, Schecter and James, 2021; Shaklee and Baily, 2012). This overlap represents one significant *subset* of the larger “global turn” in education (Manion et al., 2011), which also includes more instrumental and neoliberal-inflected versions of GE (Andreotti et al., 2010; Andreotti et al., 2016); these neoliberal versions are particularly pronounced in policy statements calling for “global competencies” and “21st century” learning (i.e. OECD, 2018; OME, 2015). In this sense, GE has significantly expanded and multiple academic, NGO and practice-based discursive communities are engaged in defining and re-defining its contours and boundaries.

Arguably, the most notable *contemporary* variant of GE is global citizenship education (GCE), which has emerged as a new field of research (see Andreotti, 2014; Andreotti and de Souza, 2012; Goren and Yemini, 2017; Oxley and Morris, 2013; Pashby et al., 2020; Shultz, 2007). In relation to other terms, such as educating for “global competence,” GCE tends toward a more justice-oriented approach (Oxfam, 2006; Tarc, 2012; UNESCO, 2013). As with older versions of GE, GCE can be framed from different ideologies or perspectives, such as neoliberal, liberal, critical/social justice and post-critical (Andreotti et al., 2016; Tarc, 2012). Still, the use of the adjective “critical” to modify GCE, emphasizes that there are less desirable versions of GCE, such as those advancing neoliberal (education as “human capital development” and “as capital accumulation”) paradigms (Ledger et al., 2019; OECD, 2018; Ong, 1999; Tarc, 2021). GCE has been advanced in key policy statements as the UN Sustainability goals (UNESCO, 2016), as well as within state ministry policies (Franch, 2020).

Goren and Yemini (2017) highlight a significant gap between critical theorizations of GCE and how GCE is taken up in schools. More bluntly, research that qualifies what teachers are already doing and thinking about in the name of GE (as an evolving set of schooling practices in a dynamic world) is scarce (Merryfield, 1998; Tarc, 2011; Pashby et al., 2021). While there are important efforts to understand how schools are taking up GE, “educational content” or documented *intentions* at policy and curricular levels tend to be the “proxies” analyzed over classroom *practices*; a good example is the UNESCO (2019) commissioned study, *Educational Content up Close: Examining the Learning Dimensions of Education for Sustainable Development and Global Citizenship Education*. Here, the objects analyzed are limited to “national laws, policies and the intended curriculum” (p. 1).

The more specific gap between *critical* GCE theorizing and school/classroom practices highlighted by Goren and Yemini (2017) is particularly timely as calls intensify for education to more substantively respond to a world threatened by multiple crises; see UNESCO’s (2021) recent report *Reimagining our futures together: A new social contract for education* as a significant example. Multiple educational researchers are discussing this gap; they highlight, for example, how demands for critical (Marshall, 2011; Tarc, 2015), “heroic” (Lyons and Tarc, forthcoming), and “redemptive” (Estellés and Fischman, 2021) versions of GCE/GE fail to “fully tak[e] into account the [political, social and] economic contexts, and pedagogic realities and traditions within schools” (Marshall,

2011, p. 422). Consequently, what emerges is a pattern of *not finding* in schools the critical idealizations desired, and instead encountering the more neoliberal-individualist forms (as raising funds for charity), and/or encountering liberal/moral (vs. political) forms of GCE (Evans et al., 2009; Franch, 2020; Mundy and Manion, 2008; Tarc, 2015; Veugelers, 2010; Westheimer and Kahne, 2004).

This enduring gap is further precipitated by instrumental notions of teacher practice (as implementation) and the intended and unintended scholasticism of academic research. To address this gap, academic theories on the limits and (im)possibilities of critical GE ought to be grounded in empirical research that substantively attends to the “lifeworld”/pedagogical conditions of schools, classrooms and teacher praxes (Marshall, 2011; Tarc, 2011). Although the pedagogical conditions of schools and classrooms are structured by larger forces that need to be robustly *theorized*, schools are the sites where GE pedagogies happen and matter. Critical theories that ignore or “black-box” these sites risk producing idealizations of little relevance. *Grounded* research addressing the gap is very limited but emerging (for example, Pashby et al., 2021).

Unesco (2021) in the document cited above that calls for a critical “social contract for education,” are clearly acknowledging this gap and the need for research to be grounded in the conditions of school teaching and practitioner knowledge. They write:

Research and knowledge about the futures of education begins with the work teachers perform, and indeed, many of the elements of a new social contract for education may already exist in the transformative pedagogy many teachers are practicing. Teachers’ work as knowledge producers and pedagogical pioneers must be recognized and supported, assisting them to document, share, and discuss relevant research and experience with their fellow educators and schools in formal and informal ways. *Universities and higher education can imagine new institutional configurations that enable sustained research and professional relationships with teachers in support of their profession-wide knowledge production.* (my emphasis, pp. 150–151).

Indeed we must find multiple routes for understanding and steering the educational processes and practices that (might) be effectual in such calls for educational reform toward sustainable and just human and planetary futures. The next section identifies a few specific lacunae for further inquiry.

Critical faultlines and tensions of GE

Above I have presented an outline of older and newer conceptions/articulations of GE found in the English-medium literature as relevant to k-12 schooling. As the world (d)evolves and the literature grows it is difficult to develop generative syntheses of such an expansive area without giving up nuance and particularity. The above more general mapping situates and foreshadows this second, more particular contribution of my entry. In this final discussion, I revisit and briefly discuss a few *fault lines* and *tensions* of k-12 GE that stand out for me as a GE researcher and educator. GE is dynamic and embedded in larger social, political and economic conditions. It is an intervention (of one sort or another) to state or “traditional” education, carrying both progressive and critical visions that are entangled with normalizing (nationalist and statist) discourses and practical contingencies. Thus, GE has been and continues to be “dancing with diversity, democracy and social justice.” The faultlines and tensions presented in this section link up with Tye’s “barriers” of nationalism and neoliberalism mentioned above. They also arise from a consideration of the qualities and (aporetic) inter-relations of education, politics and the (motivations for the) making of a better world.

The tension between strategic and dedicated cosmopolitan sovereignties and subjectivities

Retrospectively reflecting on the highest aims of international education, founding Director General of IB, Alec Peterson (1987), emphasizes the altruistic over pragmatic “intention” of international education. He states:

[International education’s] intention is not simply to help the next generation to know better their enemies or their rivals, but to understand and collaborate better with their fellow human beings across frontiers. (p. 195)

His statement reflects the longstanding hopes of GE advocates; it also highlights an enduring and indeed intensifying tension on how IE is actually manifest in the world. GE’s altruistic intention has always been somewhat tempered by pragmatic considerations, particularly from states’ nationalist agendas (for example, “soft power”). However, in recent decades, this tension between the idealist and instrumental uses of international education has become especially heightened. With GE as expedient under neoliberalism, we have economic instrumentalities dominating and thereby constraining the idealist vision at both the levels of state sovereignty and citizenship. As Ong (2006) illustrates, both sovereignties and citizenships are stretching across territories (see also Sassen, 2006), as both citizens and states *flexibly* navigate their participation in local to global economies (Ong, 1999). States understand that citizens and diasporic groups can contribute to the “nation” regardless of where they reside (Rizvi, 2005); and, middle and upper class families engage in social class making on a global scale (Ball, 2010; Ong, 2006; Rizvi, 2007; Tarc et al., 2019; Wu and Tarc, 2019).

Although GE is fundamentally an intervention against nationalism’s “disfiguring” of education (Berle in Mayer, 1968, p. vi), it nonetheless is enacted in conditions structured by state nationalism. It is not surprising, thus, to find nationalist agendas at work in GE enactments (Leach, 1969; Sidhu, 2006; Tye, 2014). For example studies find GE in US social studies curricula imbued with “American exceptionalism” (Gaudelli, 2003) and IHE in Japan and Singapore as “being driven by nationally-centred rationales” (Sanders, 2019, p. 413). Thus governments forge their internationalist projects with national interests in mind. So again, while university presidents talk about developing “global citizens” who can have a positive impact in the world, state policies frame international students as revenue generation and potential human capital.

In terms of GE and its mainstreaming under the ascendancy of neoliberalism, many states have increasingly focused on governing subjects for economic competitiveness over “flag waving” patriots (Tarc, 2009; Green, 1997). In this sense, neoliberal ideology has increasingly taken over, at least in liberal/pluralistic contexts as the core “barrier” to GE and, in turn, has been an ongoing target of critique (Pike, 2015; Richardson, 2008; Tarc, 2012). The most basic problem of the neoliberal imaginary is much deeper than the GE’s dependency on pragmatic or financial logistics, but that the very meanings of education as well as the cosmopolitan goals of GE become transformed by economic/exchange logics (Gorur, 2016; Rizvi, 2007; Borg and Mayo, 2006; Tarc, 2012). More recently still, with the rise of populist nationalisms (Geiselberger, 2017) and the attendant challenge to progressive neoliberalism (Fraser, 2019), the longer-standing barrier of an “inward” nationalism has regained ground.

Individual users of GE are also implicated in the tension between “strategic” and “dedicated” cosmopolitanism (Mitchell, 2003). On the one hand, GE is to ideally foster open-mindedness, intercultural understanding, critical thinking and global responsibility in learners; on the other hand, GE is used as a form of cosmopolitan cultural capital that individuals can mobilize within their schooling-career trajectories for social advantage in competitive and hierarchically-formed societies. So this tension of the altruistic versus instrumental agenda of GE plays out on the ground at the most micro levels. Yet, at this ground level, these agendas might not *always* conflict where educators and students engage in GE with “eyes wide open” to its faultlines and tensions.

The demands on education to make a difference and considering the educational of education

Another main fault line emerging in GE (among other progressive and critical models of education) is the increasing demands placed on education to “make a difference.” Tarc (2015) examines how the “active” in global citizenship education is discursively situated in the conjunctures and disjunctures of critical/social justice desires, liberal/experiential pedagogies and neoliberal processes. From a (progressive) neoliberal frame he finds a seamless *conjuncture* with social justice rhetoric, active learning pedagogies and individualist/market forms of acting (see also Tarc, forthcoming). The *disjuncture* is strongest from a critical perspective, where education is expected to “make a difference” at the level of “root causes” through student acting as pre-political subjects (Tarc, 2015). With (Arendt, 2006/1954) and Topolski (2008) he questions whether one can *practice* active citizenship in the absence of citizenship rights, which thereby suggests schooling’s aim might be tempered by a focus on *learning* over “action” and that, therefore, “experiential education” in political citizenship represents a kind of aporia. Students are in and of the world and becoming subjects inside and outside of schools; from a post-humanist perspective, they also have political *effects* as “actants.” However, if they are to act as political *subjects*, being seen and heard in public (Arendt, 2006/1954), their citizenship education might be thus limited as a preparatory/future-oriented education.

Lyons and Tarc (forthcoming) also take up the question of how GE might be “make a better world” in the context of an IB education in elite international schools. They challenge both neoliberal conceptions as well as more critical but “heroic” conceptions. On the latter they suggest that despite the increasing demands for education to make a difference under ongoing and looming global crises, the “educational of education” remains a “weak” and existentially “risky” endeavor (Biesta, 2014; Di Paolantino, 2018; Rogoff, 2010; Tarc, 2007b). DiPaolantino (2018) warns against what a “heroic” and “strong language” of education can produce, as follows:

Believing that education miraculously will correct or offer the answer to problems which society itself has failed to properly remedy (such as ensuring economic prosperity for all, fixing unemployment, creating social justice), we quickly come to feel betrayed and turn away in disgust from education. Our “strong language” of education actually sets us up to judge education according to a language and set of criteria foreign to education, consequently impoverishing our thinking about the educational in education. (p. 55)

By “asking too much of education” we risk losing focus on what education might *actually* do and *how* (through what modalities or mechanisms). The response to endemic depoliticization and global crises is not to politicize education, but to study and enhance enactments of, and experiments in, education from critical/social justice orientations.

Conclusion: prospects for diversity, democracy and social justice

It is important to understand that the (more desirable) idealist/aspirational visions of international education are not expressed in social/political/cultural vacuums. Thus, GE has always been inflected by the larger nationalist and colonial imaginaries activated through state policy and normalizing discursive regimes (Good, 2020; Kapoor, 2008; Sidhu, 2006). What this means is that even more well-intended pedagogical acts of encountering, understanding, caring for and/or helping Others in inter-societal

contexts can be (and are) strained or undermined by colonizing/civilizing geopolitics and mentalities of supremacy, domination and control (Jefferess, 2016; Tarc, 2013c). For this reason, critical theorizations often name and critique these potentially colonizing manifestations of GE.

Indeed, beyond the neoliberal forms, making GE more critical/justice-oriented is a major thrust in academic and educational domains as I have emphasized. Further, critical theorizations are beginning to be translated into pedagogical resources. Andreotti's (2016) heuristic for GCE teachers, for example, orients teachers and students to be attentive to uncritical/neocolonial forms of engagement, othering and self-rationalization as signaled by the acronym HEADS UP: Hegemony, Ethnocentrism, Ahistoricism, Depoliticization, Self-congratulatory tendencies, Uncomplicated solutions and Paternalism (p. 108). For another example, Tarc (2013c) employs the parable of *The Elephant and the Blind Men* to outline a set of inherent difficulties for intercultural understanding. With HEADS UP, Andreotti is further reflexive in discussing the potential limits of these terms such as, how challenging “hegemony” ought not be aimed at “creating new hegemonies” (p. 109). Moreover, as Andreotti acknowledges, even as a critically-framed heuristic, GE reflective practitioners need to have autonomy in adapting and using the heuristic and need to reflect on its enactment in the scene of classroom pedagogy. She states: “the lessons that emerge from the failure and the limits of these devices are [also] essential for deepening our understanding of educational contexts and of the process of pedagogical articulation itself” (p. 107). HEADS UP, as Andreotti shares, comes out of a particular location addressing a set of specific colonially-inherited North-South relationalities. Therefore, the heuristic represents a generative curricular object for engagement by teachers and students rather than a set of new truths to digest. Notably, researchers have begun to examine the use of HEADS UP in school classrooms (Pashby et al., 2021).

Of course forward-looking, critical and justice-oriented pedagogies emerge from *within* “national” trajectories such as citizenship education and multicultural education. In many ways, GE overlaps with these trajectories, as stated above. In our current context, despite the many challenges inherent to enacting GE discussed thus far, what GE offers these similar educational trajectories/discourses is its worldly, intercultural orientation. The radical “deparochializing” impulse of GE can support researchers’ educators’ and learners’ potential attunement to wider and deeper relationalities; a multiplicity of criss-crossing but distinctive histories, Southern theories and alternative modernities and cosmologies (Grosfoguel, 2020; Mignolo, 2007).

Thus, GE can potentially attend to diverse diversities/racializations/racisms at a more inter-societal level and challenge methodological nationalism. Admittedly the possibilities for diversity, democracy and social justice are set against the weight of history, the dramatic inequalities between groups, and the instrumental and competitive/sorting uses of education. GE ultimately compels learners to engage and learn from multiple stories/perspectives (Adichie, 2009), as well as be reflexive of the social and epistemic locations from which we have and take a perspective (de Souza, 2012) and their connectedness to “elsewheres.” Finally, it compels us to consider how the inherited categories we employ might be globalized to challenge nation-centric methods, which fail to satisfactorily attend to the complex relationalities of the world, education and the human.

Policy transfer in education

Policy transfer has been a central theme in the systematic study of education since the first efforts at creating mass education systems, and continues to be a key issue in the fields of education policy and comparative and international education. On the one hand, policy makers and those in the business of advising them have always looked at ideas, policies and practices across their borders with a focus of finding practical solutions to the universal challenge of education. On the other hand, from a more analytic perspective, researchers have been trying to understand processes through which ideas about education (including policies, institutional forms, pedagogic theories and practices) move from one context to another and are transformed as they move. Policy transfer has also been associated with geopolitics and power in education, contributing to colonial and post-colonial epistemic domination through the construction and diffusion of hegemonic—mostly Western—views of knowledge and education.

In this chapter I will provide a historical overview of the theme of policy transfer from the 19th to the 21st Century with a focus on both practical and analytical orientations. I will start by examining the period of the travellers that in the 19th Century wandered around the world looking for examples and models that could assist them in the mission of founding mass education systems in their home nations. This style of doing comparative education continued well into the 20th Century and is still even widespread, for example in contemporary study trips to Finland and other PISA winners. However, a different form of doing policy transfer emerged in the second half of the 20th Century with the consolidation of international organizations. In the second section I will analyze how international organizations contributed to the creation of a global policy space in which ideas about what it means to be an educated person, and how education should be organized, financed and evaluated are being produced and reproduced, influencing local educational practices. In the third section I identify another discontinuity in modes of policy transfer with the creation of the Program for International Student Assessment and networked policy spaces. New actors, such as for-profit corporations, and some established ones, influence education policies and practices in different ways.

The division of the chapter into these three sections is purely analytical and a way of organizing the narrative into three periods that represent ways in which ideas about what it means to be an educated person and how education should be organized circulate and are transformed. In no way, the distinction between each section is clear cut and definitive in empirical terms. For each period I will mainly focus on three themes: who are the main actors that participate in processes of policy transfer, understanding the processes through which ideas about education move and are recontextualized, and the kind of theoretical approaches that were/are used in the literature to interpret policy transfer in education.

It is also important to note that this chapter is written from a particular perspective; one of a South American academic that has studied and now works in English speaking contexts. As this text engages with the global diffusion of discourses and power related to education, it is critical to consider that there is no such thing as universal common world (Latour, 2004). How we see and interpret the world and the idea of “the global” will be affected by perspective, historical experience and material conditions. For example, experiences of colonialism, post-colonialism and the diffusion of Western modern institutions have been very different in the Americas, when compared to Asia and Africa (Moraña et al., 2008). Thus, the picture that is represented in this text, would be very different if written by scholars coming from those historical experiences. Language of course is another lens, and my linguistic limitations force me to access and use only references in Spanish and English.

Travellers and reformers

Voyages have been a fundamental part of the process of creation of mass educational systems around the world. During the 19th Century many administrators and intellectuals traveled around the world (or some parts of the world) looking for models that could be used in their own nations to develop an education system. The world expansion of the Lancasterian school method is one of the first examples of international education policy transfer since the creation of nation states (Caruso and Roldán Vera, 2005). The method started with Andrew Bell in Madras in 1790 and Joseph Lancaster in London in 1798. It expanded rapidly to schools in Britain, Africa, Australia and the United States, and after the fall of Napoleon it was adopted in almost all Western European countries. The diffusion of the Lancasterian model can also be seen as an example of how processes of policy transfer relate to geopolitics and power relations in education. A model that was created in colonial India by a British educator was transferred to Europe, to post-colonial independent states in the Americas and to other colonial sites such as Africa. Yet, the pace of the

world-wide diffusion and adoption of the system was as impressive as was the speed at which it declined (Caruso and Roldán Vera, 2005).

It was also through travel and international exchanges that what we know as modern schooling and its particular grammar were created. These were times in which mass education systems were seen as key elements in the promotion of nationalism in Europe and in the newly independent states in the Americas. The rupture between the colonial system and independence in the Americas was quite weak in terms of the distribution of power among people with different epistemic traditions. Creole oligarchies replaced the Spanish and the Portuguese authorities, but the overall colonial social structure was continued, keeping indigenous peoples and epistemologies in subaltern and marginal positions (Dussel, 2008; Moraña et al., 2008). This was the case in the development of educational systems that tended to follow European models and portrayed European peoples and epistemes as superior in both sides of the Atlantic. In this way, the politics of colonialism influenced modern systems of education, as well as the relationship between them in most parts of the world.

Cousin in France, Mann in Massachusetts, Shuttleworth in England, Tolstoy in Russia and Sarmiento in Argentina (among many others) were pioneers of comparative education in the XIX Century. They were in most cases hired by their governments to travel around the world to find examples that could help in the creation of mass education systems in their home country (Beech, 2006). Based on linear notions of progress, these travellers and reformers believed in the evolution of educational systems. Thus, they thought that by borrowing policies and institutions from other more advanced systems they could avoid their mistakes and take advantage of their achievements in their own search for an ideal education system. For example, after his tour through some selected European countries, Horace Mann, in his *Report to the Board of Education of the State of Massachusetts*, noted:

if we are wise enough to learn from the experience of others, rather than await the infliction consequent upon our own errors, we may yet escape ... those calamities under which some other communities are now suffering. On the other hand, ... there are many things abroad which we, at home, should do well to imitate; things, some of which are here, as yet, mere matters of speculation and theory, but which, there have long been in operation, and are now producing.

Cited in Noah and Eckstein (1969, pp. 17–18).

Much of the work of these public intellectuals was used in their own countries as the basis for educational reform. The Guizot Law of 1833 that established the French system of primary education was based on Cousin's *Report on the State of Public Instruction in Prussia* (Noah and Eckstein, 1969). Similarly, Mann's Report was very influential on education policy in Massachusetts (Holmes, 1981). However, these comparativists were not always in favor of transferring solutions from other countries. Tolstoy, for example, was very critical of education in Western Europe and asserted that any imitation of European institutions and legislation related to compulsory education would be a step backwards and not forwards for Russia (Hans, 1963). Many of these educators and reformers also debated the need to adapt education institutions to their new contexts. Mann, for example, noted that "if Prussia can pervert the benign influences of education to the support of arbitrary power, we surely can employ them for the support and perpetuation of republican institutions" (Noah and Eckstein, 1969, p. 23). In this way, institutions and pedagogic practices were seen as potentially neutral technologies that could be used in different contexts with very different objectives and philosophies (Noah and Eckstein, 1969).

The assumption that there are practical lessons to be learned from the study of foreign education system continued to guide research and reform up to the present days, as exemplified in the case of the US by books such as Rickover's *Swiss Schools and Ours: why theirs are better* (1962), the United States Department of Education's *Report on Japanese Education Today* (1987), Stevenson and Stigler's *The Learning Gap: why our schools are failing and what we can learn from Japanese and Chinese education* (1993), and Chubb & Moe's *A Lesson in School Reform from Great Britain* (1992) that suggested that the US should follow the market oriented logic that Thatcher had introduced in the UK. The interest in the education system of Finland after its success in PISA is a more recent example of how research in education still follows an overall approach that believes in the feasibility of education borrowing as a strategy for reform and improvement.

However, a different perspective on policy transfer emerged in the field of comparative education and consolidated with the work of authors like Ushinsky in Russia and Sadler in England in the early 1900s. Sadler's (1979) famous lecture at the Guildford Educational Conference started with a question in the title: "How Far Can We Learn Anything of Practical Value From the Study of Foreign Systems of Education?" Using the metaphor of a garden he suggested that it was not possible to cut parts of different foreign plants and hope that when placed together in a home garden a new kind of plant would be born. What is especially relevant about Sadler is that he defined a more analytical approach to comparative education and policy transfer, moving away from purely practice-oriented aims. He stressed the importance of considering education practices and institutions as embedded in a given political, economic and cultural context and emphasized the relevance of historical forces in shaping these institutions. He argued that studying foreign systems of education was useful and important. Yet the benefit of this outward look was not practical but analytical. By studying other systems of education, it was possible to better understand one's own system.

In this way, the interest in processes of policy transfer in education was divided into two main strains. A more practical oriented approach aimed at finding solutions to educational challenges by looking at examples abroad, and a more analytic strain that aimed at understanding processes of policy transfer, how ideas about education moved and the effects they generated as they were transformed in different contexts. Overall, processes of policy transfer were interpreted as responding to the following pattern: (1) a local problem was identified; (2) solutions were sought in foreign educational systems; and (3) a "tested" institution or educational

practice (that had worked or was believed to have worked) was adapted to the new context and then implemented. (4) These processes occurred in a chronological order as described above (Beech, 2011).

These processes of policy transfer were embedded within the spatial geopolitics of colonialism, including the transfer of educational models aimed at those populations that in colonial classifications were considered to be inferior. Steiner-Khamisi and Quist (2000) examine how the Hampton-Tuskegee model of industrial education that was devised in the US as a mode of education for African Americans that lived in the segregated South was imported to Africa where the British relabeled the model “adapted education,” to focus it on agricultural and manual training of Africans.

The most salient debates in the literature, regarding the interpretation of processes of policy transfer have been based on the extent to which they contribute to a growing isomorphism of education systems across the world. From a mostly functionalist perspective, what is known as neo-institutionalist approaches argue that the creation of mass elementary schools (and further educational developments) does not respond to specific political processes in different countries, but rather to the emergence of a world culture. Meyer and Ramirez (2000) describe this process as the “world institutionalization of education”:

The logic of rationalized modern mass and elite education has always meant that a high degree of international homogenization was involved. Within the framework of a world society the process of becoming a nation-state and of competing with other nation-states led to the adoption of remarkably similar technologies, such as education. This process has produced pressures towards institutional isomorphism throughout the nineteenth and twentieth centuries (p. 130).

Based on this approach, quantitative studies analyzing data from many countries have found for example that primary school curricula are very similar in most parts of the world (Benavot et al., 1991).

From a different perspective, scholars based on culturalist approaches have criticized the interpretations of neo institutionalists, mainly arguing that by looking at data at a very high level of generality, they fail to capture processes of indigenization or recontextualization through which education policies, ideas and institutions are transformed as they interact with local cultures. Using qualitative methodologies, authors such as Schriewer (2016), Steiner-Khamisi (2014) and Anderson-Levitt (2003) acknowledge the existence of global models that influence educational policies and practices, but they argue that these models are re-signified, indigenized and transformed at national and local levels, and consequently they question the idea that education policies and practices around the world tend to isomorphism.

The debate on isomorphism versus recontextualization would gain much force in the second half of the 20th century as international organizations were created and assumed the role of promoting educational policies and ideas globally.

Post-World War II: international organizations and human development

During the postwar period processes of policy transfer in education were significantly affected by the creation and consolidation of international organizations such as UNESCO, the World Bank and the OECD, as they became key actors in promoting ideas about education. The notion of development, post-colonial processes in Africa and Asia and the Cold War influenced the geopolitics of policy transfer in this period, while research in policy borrowing in education focused on the work of these organizations, on new postcolonial theoretical approaches and, later, on understanding processes of globalization.

UNESCO was created after the War with the motto “since wars begin in the minds of men, it is in the minds of men that the defenses of peace must be constructed.” As an organization for culture and education, its involvement with education policies and the transfer of educational knowledge has always been at the center of UNESCO’s agenda (Mayor and Tanguiane, 1997). The original aim of the World Bank, founded in 1944, was to provide loans to countries that had been stricken by the War, mostly for infrastructure. As this mission became redundant, it shifted its aim toward development and poverty alleviation, focusing on poor economies. Since its first loan for education in 1963, the World Bank became in the 1990s the largest single source of external financing for education in “developing countries” (World Bank, 1995, p. 14). However, the Bank’s role is not only financial. It also defines itself as a “Knowledge Bank” that creates, shares and applies knowledge about education (and other social policies). Furthermore, the Bank also promotes a certain vision of education when it associates its lending programs with certain conditions. Thus, when “client countries” receive a loan for educational purposes from the World Bank, this act is not only a transfer of funds, but it is also a policy transfer. The OECD was also created to administer American and Canadian aid under the Marshall Plan for reconstruction of Europe after World War, and later shifted its focus. One of the most important objectives of OECD is to search for certain universal values, rules and policies and promote them among member and non-member countries. However, the OECD has no prescriptive mandate over its member countries (Papadopoulos, 1994). As part of this role, the OECD positions itself as an organization that can understand emerging challenges and identify and promote the kind of policies that should be used to tackle them. Thus, the “transfer” of “cutting edge” educational knowledge has been for many decades one of the main self-proclaimed roles of UNESCO, the World Bank and OECD.

The creation and expansion of these organizations was strongly linked to the notion of development applied to social issues that became fundamental to understanding the geopolitics of education and the expansion of global policy spaces in education in the Post War period. In 1949 President Truman presented a vision for international development that would become a landmark for the work of international organizations.

... we must embark on a bold new program for making the benefits of our scientific advances and industrial progress available for the improvement and growth of underdeveloped areas (...) I believe that we should make available to peace-loving peoples the benefits of our store of technical knowledge in order to help them realize their aspirations for a better life.

Truman (1949).

The notion of development became a potent discursive construction in the geopolitics of policy borrowing in education and provided a form of continuation to the logic of colonization (Escobar, 1995). The binary developed/underdeveloped became a key feature in the circulation of knowledge and power in education, as countries were classified as belonging to one of the two poles, which implied being on the donor or the recipient side in the flows of education policy transfers. At the same time, post-colonial processes in Africa and Asia meant that many newly created countries were faced with the economic and technical challenges of creating their state bureaucracies, including their education systems. It was international organizations (and some national development agencies, such as USAID) that led the efforts to promote mostly Western technical knowledge about how to administer education to developing countries. In this way, Western education systems became a norm and a model for the newly independent nations and contributed to the perpetuation of colonial domination through other forms.

The agenda focused on promoting macro level organizational techniques, such as educational planning. The recipients were mostly high-level officials from the Ministries of Education that were offered technical reports and participated in training and regional or international meetings. By promoting developmental and technocratic views, international agencies were advocating a number of abstract universal social technologies that—in the logic of these agencies—could be used to improve education in most contexts (Beech, 2011).

Another relevant geopolitical force during the period was the Cold War. The two superpowers competed for hearts and minds around the world in a cultural war that was fought through propaganda, cultural influence and through education. The Soviet Union, for example, influenced the education systems of China and Cuba, while the US had a strong influence in the development of education in Brazil that, for example, adopted the model of the Comprehensive High School (Cowen and Figueiredo-Cowen, 1989). While the superpowers were fighting to control the world militarily and politically, education also became one of the arenas of the dispute. For example, the launch of the Sputnik by the USSR was conceptualized as an educational crisis in the US. The education system of the Soviet Union attracted the attention of US researchers, as illustrated by Trace's (1961) "What Ivan knows that Johnny doesn't." However, the "solution" to the lack of creativity promoted in schools was found in the child-centered English Infant Schools that became a source of inspiration for school reforms in many states in the US (Ravitch, 1983).

With the end of the Cold War, the notion of globalization gained the spotlight and had a significant influence in further legitimizing the work of international organizations in education. The late 1980s and early 1990s were read as a moment of enormous social change that required a substantial reengineering of education systems. Technological changes such as the ubiquitous diffusion of the personal computer and the incipient Internet, post Fordism and knowledge economies, postmodernity and respect for diversity were some of the drivers of changes in education, alongside the fall of the Soviet Union. The idea that education systems had been created for another era and should be completely reinvented was widespread. In this context, international organizations positioned themselves discursively as the experts that could predict future changes and offer a recipe for education systems to adapt. On the other hand, the notion of globalization implied that all educational systems were facing similar challenges and that solutions should also be global in nature, reinforcing the discursive power of international organization.

Giddens's (2000) lectures that were published under the title "Runaway World: How globalization is shaping our lives" captured the spirit of the times. In response to a rapidly changing world that was seen as out of human control, international organizations promoted a "Universal Model of Education for the Information Age" (Beech, 2011). The logic was that since global changes could not be controlled, the best that educators could do was to be flexible and adaptable to the new social conditions, educating young people to also be flexible and adaptable to change. Lifelong learning was seen as a fundamental technology for people to be able to learn and relearn as would be necessary to respond to economic changes, themselves driven by technological advancements. Overall, the model was based on promoting decentralization and school autonomy, lifelong learning, a curriculum based on the development of competencies, child centered pedagogies that redefined teachers as facilitators of learning, and standardized evaluation systems based on performance indicators that connect the policy producing center with schools and teachers that should be granted more autonomy to attain pre-defined goals.

Although this model was presented as being universal, it was devised from a Western epistemic and political perspective with little attention to non-Western forms of knowledge and ways of life. This model, which with some variations was promoted by UNESCO, the World Bank and the OECD, became a norm that could be used to identify the problems with education systems all over the world and, at the same time, it offered the solution to those problems (Beech, 2011). Another significant shift for understanding processes of policy transfer is that the model did not only provide a template for changing educational governance at a macro level, but also focused on prescribing quite detailed curricular changes and pedagogical approaches, a shift in focus that would be intensified in the future.

The emergence of international organizations as key actors in promoting policy transfer in education had a strong impact in the ways in which policy ideas travel and are recontextualized. It also generated different kinds of interpretations in the literature.

Noah and Eckstein (1969), for example, defined the initial efforts of international organizations as an advancement toward what they envisaged as a scientifically legitimated comparative education: “The work of these organizations is in the hands of specialists. Thus, what began as philanthropy has ended with professionalism” (Noah and Eckstein, 1969, p. 82). Others were much more critical. Based on *dependencia* theories stemming from South America, Carnoy’s (1974) *Education as Cultural Imperialism* saw international organizations as mechanisms of imperial domination that promoted capitalist hierarchies. A similar logic was followed by Altbach and Kelly (1978) in *Education and Colonialism*. These texts, among others, introduced the problem of agency into discussions about educational transfer. They implicitly distinguished between voluntary and non-voluntary policy transfer, depending on who was the prime agent of the process and brought into the fore the ethical issues of colonization and post-colonial dominance in the circulation of knowledge about education around the world.

The work of international organizations in education became the focus of much research since the 1990s, as they gained power as central actors in the globalization of education. Overall, studies were focused on understanding how these organizations contributed to reshaping educational policy spaces and the flow of power in education (Ball, 1998; McNeely, 1995; Shahjahan, 2012), on analyzing the work of one of these agencies or the interactions between them (Jones, 2006; Sellar and Lingard, 2013; Beech, 2009b; Bonal, 2002), and on examining the processes through which the recommendations of these agencies were recontextualized in different settings (Waldow et al., 2014; Ydesen, 2021). Many of these approaches had a very critical view of the ways in which these organizations imposed educational principles and perspectives in non-Western contexts (Shahjahan, 2016; Sguissardi and Amaral, 2000).

What is clear is that the involvement of international organizations in promoting education policies implied a significant change in how ideas about education traveled. The first, and most noticeable, shift away from trans-national patterns of policy transfer is that policies do not move from one educational system to another, but from international agencies to specific educational systems. International organizations are abstracted from actual educational policies and practices. They aim at identifying a series of universal educational principles that could be applied in most education systems to improve education. Thus, what is transferred is not a tested education policy, but rather a set of abstract universal social technologies (Beech, 2011).

The second shift in patterns of policy transfer is linked to the sequencing of the process. In trans-national patterns of educational transfer, following a chronological order, a problem was identified, then a solution was sought in a foreign system, and finally a “tested” social technology was transferred. When international organizations promote certain educational principles, they simultaneously define the problems of an educational context and offer the solutions to these problems. So, for example, what I have labeled the Universal Model of Education for the Information Age does not only include the solutions to most educational problems, but it also defines the problems in the education systems to which it travels. This abstract universal model is offered as a norm against which the adequacy of existing educational policies in a given context can be measured. Once the “problems” have been identified, there are only a limited number of themes that can be debated, and a limited number of policy options that can address them (Beech, 2011).

Another important shift to consider, is that since the 1990s international organizations included within its focus much more detailed prescriptions related to curricular content and pedagogic strategies. This trend toward a focus on the classroom and the work of teachers would be further intensified in the 2000s.

Global policy spaces: international large-scale assessments and the global educational market

The next discontinuity in processes of policy transfer in education can be associated with the creation of International Large-Scale Assessments (ILSA), the consolidation of global policy spaces in which new kind of actors participate in promoting the global circulation of ideas, and, among these new actors, the involvement of for-profit corporations that compete for financial benefits in what they see as a global educational market.

The creation of ILSAs contributed to a systematic reference to compare education systems based on student learning outcomes. Although the first ILSAs started in the 20th Century it was the launching of the OECD’s Program for International Student Assessment (PISA) that had the biggest impact on changing the landscape of global policy spaces in education. The first ILSAs assessed students in terms of their local curriculum, and consequently the comparison between countries did not necessarily show that students in one country had learned more or better than the other. PISA assesses students in terms of a universal definition of what a student should have learned at age 15 to be prepared to fully participate in the knowledge economy. In this way, PISA became a universal measure of education quality that was accepted by educators, political leaders and researchers as an objective indicator of education quality, validating international comparisons and global rankings.

The position of an education system in the PISA ranking became a fundamental indicator of the quality of that education system and in this way, winners and losers were identified (Novoa and Yariv-Mashal, 2014; Kim, 2017). This had several effects in terms of processes of policy transfer in education. The notion of “PISA shock” was coined to describe the situation generated by lower than expected results in places such as Germany (Waldow, 2009) and Japan (Takayama, 2008, 2012) among many others (Pons, 2012). The reaction, in many cases, was to conceptualize PISA winners, most notably Finland, as the solution to the educational problems that PISA had made visible. The other side of the crises was the portraying of the winners, with Finland in particular as the poster boy that attracted massive attention from educational researchers and policy makers (Baroutsis and Lingard, 2017). Educational Tourism to “go and see” Finnish education to distil and copy their “best practices” was reminiscent of the times of the travellers and reformers of the 19th Century.

Through its global rankings, PISA also contributed to the further consolidation of the performative logic (Lyotard, 1984) in global education. As the desired output of education was standardized around the world and defined in terms of a numerical measurement, education policy was recast as a series of interventions to improve these outcomes. Although it is clear that even with all its technological sophistication PISA cannot measure all aspects that would constitute a good education, the improvement of PISA scores is increasingly being defined as the aim of education. In this sense, as PISA and its rankings gained legitimacy it became a driver of educational reforms aimed at aligning curricular definitions and assessment practices with its standardized tests. Efficiency became an end in itself. The curriculum focuses on the subjects that are assessed in PISA, and pedagogic practices are aimed at training for the test.

Through PISA, the OECD has become the main reference in global educational debates, promoting a market-oriented logic that places individuals as the focus of educational strategies and narratives about human progress and global understanding. Furthermore, springing from the success of PISA, the OECD has created new projects to extend its influence to other countries through the creation of PISA for Development (Addey, 2017; Auld et al., 2019), and to other areas of education with an assessment for teachers (TALIS), one for five year-old children to assess the quality of early childhood education (Urban, 2017), and the Program for the International Assessment of Adult Competencies (PIAAC) (Schleicher, 2008). Yet, in parallel to the growing influence of the OECD, new types of actors started to get involved in the business of promoting ideas about education globally.

Global policy spaces in education have become a complex array of competition and collaboration between different institutions, such as international organizations, private for-profit corporations, global philanthropies, NGOs, consultants, regional blocks, universities that participate in different networks with the aim of influencing education policies in new ways (Beech, 2009a). Policy consultancy, the provision of educational services, evaluation, learning technologies and pedagogical consultancy have all become commoditized. Knowledge on how to improve education is produced in order to be sold and is bought in order to augment performance in standardized tests. Alliances between international organizations, for profit corporations and philanthropies further contribute to the marketization of education, and to blurring distinctions between public/private, for profit/non-for profit and global/local.

The case of Pearson can illustrate some of the complexities of global policy spaces. Pearson is the biggest global corporation in education (Santori et al., 2016). It defines itself as the world's leading learning company. It has more than 20,000 employees and provides its services in more than 20 countries. One of the many services it offers is education policy consultancy to governments and pedagogic materials and training for schools. Pearson hired Michael Barber as its lead education adviser. Barber had previously worked for McKinsey (another for profit consultancy) and was responsible for reports (Barber and Mourshed, 2007; Mourshed et al., 2010) that became very influential in education policy in many parts of the world. Prior to working for McKinsey, Barber had been "Prime Minister's Chief Adviser on Delivery" during the Blair government in the UK (Coffield, 2012). In 2014, Pearson partnered with the OECD to develop the technical aspects of PISA. This partnership improves the market value of its products. If Pearson is developing the PISA tests and governments measure their educational success in terms of their performance in these tests, policy solutions sold by Pearson become more attractive as they are the ones who "know how to do it."

Low fee private schools constitute another business opportunity into which Pearson has invested. It created the Pearson Affordable Learning Fund (PALF) with the vision "to help millions of children in the world access a quality education in a cost effective, profitable and scalable manner" (Pearson, 2016). PALF is a venture fund through which Pearson invests in local edupreneurs in countries such as the Philippines, Nigeria, Ghana and South Africa, with a focus on high quality, for-profit education solutions for the low-income segment in the developing world (Santori et al., 2016). Chains of low fee private schools for the poorest populations in the world have become a growing feature of the globalization of education and the transfer of education models across space. The ethical implications of these initiatives have been heatedly debated in the literature (Srivastava, 2016; Nambissan and Ball, 2011; Edwards et al., 2017; Tooley, 2013), and in global civil society (OXFAM, 2019). Some of the ethical contradictions of these moves can be seen in the voice of Pearson itself, as it notes that the creation of the PALF is based on a "moral imperative" to improve the quality of learning in the poorest regions of the world and contributing to the achievement of the UN Sustainable Development Goals. This moral imperative was addressed through the creation of a for profit venture fund in response to what the company sees as a "vital market opportunity" (Santori et al., 2016). The discursive rationality behind this approach is clear in the words of Pearson's CEO:

We believe that a free-enterprise model of low-cost schools—schools affordable for many of the poorest—may be the best chance to provide both benefits.

Cited in Santori et al. (2016).

The logic is that for a social problem to be solved, such as access of the poorest populations of the world to education, it has to be commodified to attract investments searching for profit. Yet, low fee private schools for the poor are not only promoted by Pearson. They are part of a complex network in which the boundaries between international organizations, philanthropies, for profit corporations and entrepreneurs and, sometimes, state institutions are difficult to delimit (Ball and Junemann, 2012). These global policy spaces are dominated by market ideologies that permeate the definition of education itself. In this way, the market-oriented, individualized logic of an education for economic competition dominates education policy debates, while it also perpetuates and extend geopolitical differences and post-colonial practices in education.

Another relevant change in processes of policy transfer in education and in the influence of global actors on education policies is the shift toward a focus on the classroom and teaching practices. McKinsey and the OECD have been very influential in promoting the idea that teachers are the most important factor in improving the quality of education (Barber and Mourshed, 2007; Mourshed et al., 2010). This view had a strong impact on education policies all over the world, but also at the level of global actors themselves. The OECD is producing lesson plans for teachers (Vincent-Lancrin et al., 2019) and the World Bank (2019) offers a classroom observation tool to assess how teachers use time and the kind of classroom culture and socio-emotional skills they promote. What is visible is a further move toward a focus on pedagogic practices in global actors that aim at influencing schools and teachers directly, even sidelining state institutions. The creation of PISA for Schools, a version of the conspicuous OECD assessment that can be contracted by individual schools, is another example of this kind of move (Lewis, 2017).

These major developments in global policy spaces have attracted the interest of researchers and have resulted in rich empirical and theoretical contributions to the understanding of the complexity of global influences in education.

One of the most prolific areas of research that benefited from the availability of PISA data that can be used to compare the quality of education outcomes across space and time is the Economics of Education. Furthermore, PISA data in conjunction with other socio-economic indicators has been used in efforts both to explain why certain education systems perform better than others (Hopfenbeck et al., 2018), and to analyze how the quality of education is related to other outcomes, such as economic growth (Hanushek and Woessmann, 2007). These works have been quite influential in legitimating educational reforms and much of the proposals of the World Bank and the OECD. However, both the search for factors that explain success and the causal inference that connects education attainment with economic performance have been object of criticisms for making lineal unfalsifiable claims (Auld and Morris, 2016), and for having statistical problems (Komatsu and Rappleye, 2017).

PISA has also become a central object in the fields of comparative education and education policy. It is not easy to map all of the different approaches to PISA in the literature, but overall, some authors have aimed to understand how PISA and other ILSAs impacted in modes of governance in education (Sellar and Lingard, 2013; Gorur, 2014), while others have criticized PISA mostly in relation to its rankings and the ways in which the OECD and specific governments have used politically the results of the exams (Takayama, 2008; Gorur and Wu, 2015; Waldow, 2009).

Discussions of the new spatialities of education and the search for new theoretical approaches to understanding the circulation of knowledge and power about education globally have also flourished. The use of relational notions of space that see space not as a container of social processes, but rather as being constructed and reconstructed by social interactions has been an important development, complemented by approaches based on the mobility turn (Urry, 2012) and cosmopolitan sociology (Beck, 2006). Overall, the authors following these perspectives have made an effort to open up the notion of globalization and understand the complexity of power relations in the educational field. One of the most important moves in this respect has been the awareness of the need to rethink borders and binary definitions such as global/local, macro/micro, public/private, among others.

In rethinking education space, the notion of networks has been at the center of the literature, both in terms of theoretical and methodological approaches. So, for example, the idea of networked governance has been widely used to explain the ways in which state actors link with non-state actors to govern education (Ball, 2009; Lingard and Sellar, 2013). These actors connect through networks that have been described as heterarchical—horizontal and unstable networks that are contrasted with more stable and hierarchical relationships in bureaucratic logics of government. Methodologies such as social network analysis and network ethnography have been used to map and interpret flows and movement in global education policies (Avelar and Ball, 2019). Actor-Network Theories and other approaches related to Science and Technology Studies have also been used in very different ways to explore the global governance of education and its interaction with local education policies and practices, adding an emphasis on materiality and the heuristic device of assemblages to understand power and change (Gorur, 2011; Beech and Artopoulos, 2021; Piattoeva, 2018). A final line of prolific and very productive line of work has been based on a critical political economy approach to the globalization of education (Novelli et al., 2014; Robertson and Dale, 2015).

Conclusions

In this chapter I have shown how educators around the world have collaborated through processes of policy transfer in sharing ideas on how to better educate the younger generations. Processes of knowledge sharing have taken different forms throughout history, but overall have contributed to the construction of certain global common ways of approaching education.

From travellers making long journeys to find the holy grail of reason and science used for building mass education systems as a mode of government, to Pearson and its associates addressing the moral imperative of educating the poorest population of the world while making monetary profit. What is clear is that the movement of ideas about education has followed the fault lines of geopolitical power: From religious institutions in pre-modern periods (not covered in this chapter), to colonialism, the modern Nation-State and to global for profit corporations in the 21st Century.

As much as policy transfer can be seen as a process of collaboration, it is also a mode of competition and colonization. Global policy actors sometimes collaborate in a complex array of fluid and unstable networks, but they also compete to influence education policies in different places. Furthermore, through mechanisms such as PISA, some of these global actors promote competition among education systems that see their position in the global ranking of education quality as a measure of their failures and success. For example, in a quite remarkable statement, the 2013 Australian Education Act defined the objective to be in "the top 5 highest

performing countries based on the performance of school students in reading, mathematics and science” by 2025 (cited in Gorur and Wu, 2015).

The rationale for promoting competition within and among education systems is well known in the market oriented logic that was introduced in the governance of education in the dictatorship of Pinochet in Chile and the governments of Thatcher and Reagan in the UK and US. This logic that has now become dominant in global policy spaces assumes that competition results in overall improvement.

However, at times in which humanity is facing huge challenges, such as the climate crisis, growing inequalities, the weakening of democracy, growing military conflicts and the covid pandemic, it seems that a push to be more effective and efficient at delivering the same kind of education could be at least problematic. For example, countries with higher scores in PISA are also the ones with the most carbon emissions (Komatsu and Rapple, 2018). Correlation does not imply causality, but in this case it might be an indication that delivering faster and more efficiently the current education paradigm, itself associated with a non-sustainable mode of living, might not be the best way to address these challenges.

On the contrary, to successfully address the challenges we are facing we will need to collaborate both within our communities and at a global scale. That is why we need to promote a kind of education in which children and young people learn to live and collaborate with others that are different, rather than promote competition and individualization as the reigning values in education. In doing so, it might be important to pay attention and draw upon non-Western approaches to knowledge and education.

With this in mind, UNESCO created two years ago the Futures of Education initiative that has recently launched a major report with the title *“Reimagining our futures together: a new social contract for education?”*. The report seeks to promote a global debate on how knowledge and learning can shape the future of humanity and the planet. It is based on the conviction that education does more than respond to a changing world. It has the potential to transform the world. The report is both an attempt to regain UNESCO’s leading position in global educational debates and to reaffirm its own historical more humanistic perspective to balance the dominating market driven logic. The report defines education as a public endeavor and a common good while it appeals to an education based on the principles of cooperation, collaboration and global solidarity instead of competition and individuality. Furthermore, the Report’s critique of standardized tests and rankings is probably its most firm counterpoint with the logic promoted by PISA.

The debates about these two very different ways of approaching the relation between education and the future of humanity will probably take the center stage in global policy spaces in the next few years. These debates highlight how education is more than just teaching and learning. Education has the ability to shape the future and our approaches to challenges such as climate change, growing inequalities and the pandemic. Whether young people face such challenges collectively or individually; in competition or through collaboration, will surely be influenced by the kind of education principles promoted in global policy spaces.

Introduction and aims

This article offers an overview and introduction to Afrocentric education, describing the central tenets of Afrocentric education as well as its political and philosophical origins. We also investigate the early purposes and contemporary implications of Afrocentric education (a term which, for the purposes of this chapter, we define to include Africentric, African-centered, and African-focused education). At its core, Afrocentric education offers educational possibilities which lie beyond, and which belie mainstream multicultural approaches to teaching and learning. Recognizing that schooling in colonial, settler colonial, and so-called post-colonial contexts frequently constitutes and is constituted by White supremacist and colonial power relations, Afrocentric education offers a critical rejection of colonial knowledge, ways of knowing, pedagogies, and educational systems. As an alternative which supports the spiritual, psychological, and academic well-being and learning of African and African Diasporic learners, Afrocentric education centers African and African Diasporic knowledges, cultures, histories, epistemologies, pedagogies, and politics.

Although Afrocentrism and Afrocentric education may be sometimes grouped within broader categories such as inclusive education, multicultural education, critical education for social justice, etc, we do well to recognize that Afrocentric education holds at its core a fundamental rejection of assimilationist ideals in education. While these broader categories are no doubt areas of study and practice which aim to better serve all students from pre-K to university contexts, at the core of most mainstream moves to equity in education lies a hope that a core curriculum which serves and includes all students is possible—or at the very least desirable. Afrocentric education focuses instead on the contemporary education and well-being of African and African-descended peoples specifically, in recognition that African and African Diasporic knowledges, pedagogies, and traditions can powerfully support the learning and well-being of African and African-descended children and youth in formal education settings, and that mainstream education (including decades of equity and inclusion initiatives) has persistently failed African-descended students.

As a starting point, Asante (1991) argues that Afrocentricity questions “the imposition of the White supremacist view as universal and/or classical (Asante, 1990); demonstrates the indefensibility of racist theories that assault multiculturalism and pluralism; and projects a humanistic and pluralistic viewpoint by articulating Afrocentricity as a valid, nonhegemonic perspective” (p. 173). With roots dating back well over a century, Afrocentricity, broadly understood, has a history which spans continents and generations. In elementary and secondary schooling, Afrocentric education is taken up in a variety of ways in a variety of places. Most notably, schools in the US saw a rise in independent Afrocentric schools beginning in the 1970s. Additionally, a number of schools in the US and Canada offer Afrocentric programming, and often associate culturally affirming school practices with Afrocentric schooling. At the upper secondary and post-secondary levels, Afrocentricity is an important area of study, and is often braided with other critical analytical frameworks.

This chapter focuses generally on Afrocentric education as a philosophical approach in education. After offering remarks below on our subject location as authors, the first section of this chapter provides an overview of the historical origins of Afrocentric education, noting a varied a complex history with roots in a number of traditions. The next section takes up the key purposes, tenets, and philosophies of Afrocentric education, with a look at key contributions from leading scholars. We offer the basic tenets of Afrocentric schooling with hopes that these are instructional for moving the debate along in terms of concrete ways for counter visioning primary and secondary education. Finally, we discuss the contemporary implications and offerings of Afrocentrism for educational change in the early-mid 21st century. We take up what it means for Afrocentric schooling and education to advocate for social change, and how we can collectively ensure our young learners practicalize and actualize what they learn in school in terms of Afrocentric teachings. We also argue for the potential of pedagogies employed in Afrocentric schools to be applied in mainstream education contexts to serve all students. The contributions of Afrocentric education are indeed an important focal and entry point for critical educators in an age of widespread and highly public struggles for racial justice.

Authors' self locations

We start this paper with our respective voices before we join in a conversation.

George Dei: I acknowledge that I am writing from the Treaty Lands and Territory of the Mississaugas of the New Credit First Nation and the Dish with One Spoon Wampum, what is now known as Canada. The Land has always been a source of Earthly teachings and blessings. I also relate to this Land from my African Indigeneity as a member of the traditional Asakyiri clan of the Ghana, my birthplace. The Asakyiri clan is one of the eleven major clans in the Asante kingdom of Ghana, and our spirit animal is the vulture. Asakyiri mythology states my ancestors chose the vulture as our spirit animal because of our collective belief in making use of that which has been discarded. This, along with the vulture's teachings of being cognizant of the downtrodden and forgotten and how not to be, has advanced my appreciation of life and the privileges I have been granted. I see the vulture as an important source of learning about the sanctity of life and activity.

Teaching and learning demands the sanctity of activity as our coming to know only makes sense with connections of the social, physical, and metaphysical realms of human existence. We are in relation with the entire universe as "fundamentally spirit and spiritual with material manifestations" (Carroll, 2014, p. 259), stressing the importance of community cultural values and prioritizing group relations. This is a philosophical worldview that crystalizes in the nexus of body, mind, soul, and spirit in the coming to know, understand, and act within worlds. Education is more than an activity of the body and mind. To engage in holistic learning, we must engage the soul and spirit of learners. My scholarly work through the African-centered lens has led me to appreciate social justice and equity work as flowing from spirituality. Thus, I locate my classroom teachings and scholarship within the context of an African identity constructed in history, culture, and politics laced within spiritual ontologies. I validate Afrocentrism as an appreciation of the teachings of African culture, history and Indigeneity as important starting points. This validation has served as foundational knowledge with which to interrogate schooling and education, and to think through new educational futures. I see the Afrocentric paradigm pioneered by global influential scholar Molefi Asante and others as offering a significant counter reading of what we understand to be schooling for particular [but not exclusively] youth of African descent. Of course, no knowledge is immune to interrogation and criticisms. I also believe that we cannot dismiss a counter-reading of our world and the possibilities of what Afrocentric education can offer in the education of young learners of today. In my journey in Afrocentric scholarship, I have worked with Arlo Kempf in mutually reinforcing and beneficial ways to contribute to the literature on Afrocentrism from the Canadian context.

Arlo Kempf: Acknowledging that where we come from informs where we are, George and I are writing from different places. I am a White settler Canadian. On my father's side, my ancestors came to North America from what is now Germany. On my mother's side, our people come from Oklahoma—after searching through a series of adoptions, stories, lies, and aspirations, as best I can tell my ancestors were likely Scottish and Cherokee—I'll never be sure, and as I have never been claimed by any group, I make no claims to any group. I was born on Kanien'kehá:ka land in Tiohtià:ke (commonly known as Montreal). My parents were immigrants from the United States. We later moved to Treaty 13 territory, and I grew up there, on the land of the Mississaugas of the New Credit in what is commonly known as Toronto, where I work and live today. Settler Colonial momentum is a river into which Canadian Settlers are born, or into which they migrate. As I have written before (Purton et al., 2020), stepping out of the water requires first noticing its ceaseless movement—the way it flows around bends and breaks, over rocks and through low hanging brush. If one is lucky enough to notice, it then takes some doing to get out of its rushing waters. I'm not there yet, but I work to find, at the very least, an eddy on the margins of the river from which to catch my breath and step out of the flow. I write from this context of complication, privilege, and humility—a positionality that informs my work as a scholar and my actions as a citizen, family member, descendant, and sapiens. I have been speaking and writing about these issues for about a decade; privileged to do so primarily with my co-author who is, in his own right, a founding scholar of Afrocentric thinking in education. I thus come to discussions of Afrocentricity and Afrocentric education typically when invited—guided by an intellectual humility, informed by my positionality, and my tremendous respect for the African and African-descended scholars and activists who have guided and continue to advance this important work.

Origins and historical overview of Afrocentric education

We locate Afrocentric education outside of any particular national, state, provincial, or district context, as a transhistorical framework that resists and forgoes Eurocentric teaching and learning in favor of education that focuses on the implications and applications of African scientific and cultural knowledges, epistemologies, and axiologies in order to support the academic, spiritual, and psychological success of African-descended students. The vast majority of contemporary academic work on Afrocentricity focuses on charter schools in the United States. Although we offer brief commentary on US Afrocentric schools below, US Afrocentric charter schooling should not be taken as an exemplar or definitive example in determining our understandings of Afrocentric education. Afrocentric education is an applied terrain of Afrocentric theory and activist struggle. We thus locate the historical origins of Afrocentric education more broadly, within critical African-centered knowledge, theoretical approaches, and activism for racial justice.

In the US context, this work goes back well over a century to works of African-American scholar, poet, and activist W.E.B. Du Bois (1868–1963). He was among the earliest African-American anti-racist scholars and public intellectuals, and was the first African-American to earn and receive a doctorate from Harvard University. Du Bois' early theorizations of the race problem in the US remain

a guide for contemporary anti-racist scholarship (see Du Bois, 1996), and his contributions remain a central inspiration for contemporary Afrocentric theory. As co-founder of the National Association for the Advancement of Colored People (NAACP), Du Bois was also the editor-in-chief of the NAACP's revolutionary journal, *The Crisis: A Record of the Darker Races*, founded in 1910 and still in circulation as of 2020.

Du Bois theorized the need for African peoples to reconceptualize race at the structural, institutional, and individual levels in order to mitigate the impacts of quotidian racism and to challenge systemic and structural racial oppression. Du Bois was also among the first scholars to consider and theorize the epistemics of race and positionality with regard to the lived reality of race in the US generally and the experiences of African-Americans specifically. Coining the term "double consciousness," Du Bois articulated the processes by and through which African-Americans developed a sense of self through both self-perception and the process of being perceived and thereby understood by White Americans. Writing in 1903, he argued:

It is a peculiar sensation, this double-consciousness, this sense of always looking at one's self through the eyes of others, of measuring one's soul by the tape of a world that looks on in amused contempt and pity. One ever feels his two-ness—an American, a Negro; two souls, two thoughts, two unreconciled strivings; two warring ideals in one dark body, whose dogged strength alone keeps it from being torn asunder.

Du Bois (1996, p. xxxiv).

These early articulations of race and racialized consciousness and experience have provided a foundation for subsequent academic and activist anti-racist work, and have underpinned US civil rights movements for the past 75 years. This includes later formulations of Afrocentricity which draw heavily on notions of raced consciousness and raced experience.

Writing around the same time, Liberian-American Edward Blyden rejected Eurocentric readings of African culture as lacking or incomplete. He argued that African societies were epistemically and culturally complete and whole, and suggested this understanding was absent in mainstream teachings about Africa to Africans in the Diaspora (Blyden, 1994). Coalescing in New York City (as early progenitors of the Harlem Renaissance), African-American thinkers and leaders like Arthur Schomburg, John Edward Bruce, and others promoted the inherent value of African knowledge and culture. In 1911, Bruce and Schomburg founded the Negro Society for Historical Research in Yonkers, New York. Four years later in Chicago, Illinois, Carter G. Woodson, William B. Hartgrove, George Cleveland Hall, Alexander L. Jackson, and James E. Stamps established the Association for the Study of Negro Life and History on October 2, 1915.

Following these early works, in 1933, Carter G. Woodson offered a foundational contribution to the education question with his coining of the term "miseducation" to identify the process of methodically denying African Americans access to education in which they might find themselves well-represented in their full humanity (Woodson, 1933). Woodson located this miseducation at the heart of the cultural, economic, and social oppression facing African-Americans, and noted the disproportionate value placed on Eurocentric teachings in mainstream schooling as harmful for Black children.

At roughly the same time, the work and influence of Marcus Mosiah Garvey (1887–1940) was on the rise. Garvey was a Diasporic anti-racist organizer, leader, and theorist whose work was key for later conceptions of Afrocentricity. With powerful critiques of the structural, institutional, and individual racism facing Africans in Africa and the Diaspora, Garvey offered a revolutionary articulation of the realities of racism with an emphasis on the agentive capacities of Africans on the continent and throughout the Diaspora. Garvey was the founder Universal Negro Improvement Association and African Communities League (UNIL-ACL) which originated the popular Back-to-Africa movement. By 1918, Garvey had founded the ground-breaking newspaper *Negro World* published by and for African-American and African peoples. The Back-to-Africa movement promoted the notion that Africans in the Diaspora should return to the continent to avoid and reject the racial prejudice, discrimination, and exclusion, which were rampant in Diasporic contexts.

Membership of the Universal Negro Improvement Association numbered in the millions by 1920 as Hill notes (1983, p. 36) with precise numbers unknown; while the circulation of *Negro World*, grew to between 50,000 and 200,000 (Hill, 1983), also with precise numbers unknown. Although the newspaper did not constitute a formal curriculum in a schooling sense, this widely read periodical offered a powerful rejection of mainstream cultural and historical analysis. At the time, as is the case in some contexts as of this writing, mainstream curricula (both formal and informal) available to African-Americans was frequently White supremacist, colonial, and exclusive of the experiences of African and African-descended peoples. *Negro World*, like the NAACP's *The Crisis* offered an African-centered reading of the world.

This intellectual and activist trajectory continued into the latter half of the 20th century. The US Black Power and Black Nationalist movements of the 1960s and 1970s can be understood as a continuation of the work of early 20th century thinkers and activists, all of whom drew on Indigenous African epistemologies, axiologies, and knowledges. In some cases, the earlier work of scholars such as Du Bois and Garvey ended up influencing African intellectuals, including Chinua Achebe, Cheikh Anta Diop, and others, who would in turn inspire the critical Afrocentric work in the US, including that of intellectuals like Molefi Kete Asante, Maulana Karenga, Kofi Lomotey, Mwalimu J. Shujaa, and others who would establish the contemporary foundations of Afrocentricity discussed in the next section.

As we note elsewhere (Dei and Kempf, 2013), Diasporic Africans have continuously resisted oppression in both action and theory when faced with racial educational injustice. Indeed, the contemporary discussion and practice of Afrocentricity and Afrocentric education stand on the foundations erected by those who have come before. African-centered education builds on the work and struggles of radicals, activists, poets, scholars, and regular people in Africa and the Diaspora who have fought against

oppression in their own ways. These figures include Frederick Douglass, Harriet Tubman, Booker T. Washington, Langston Hughes, Frantz Fanon, Aimé Césaire, Amílcar Cabral, Rosa Parks, Viola Desmond, Martin Luther King Jr., James Baldwin, Malcolm X, Nelson Mandela, and countless others.

Struggling for Afrocentric schooling

Scholarship on Independent Black Institutions, Charter Schools, and Black Supplementary schools (as they are called in the United Kingdom) offers important analysis and documentation of the early educational activism of Africans in the Diaspora. The works of [Anderson \(1988\)](#), [Butchart \(1980\)](#), [Ratteray \(1992\)](#), and [Watkins \(2001\)](#) detail resistance by African-descended peoples in and to colonial schooling contexts, while [Ratteray and Shujaa \(1987\)](#) trace this tradition of resistance to the 1790s and the global system of trade in enslaved people. Contemporary activism for racial justice in education, and some conceptions of Afrofuturism ([Ladson-Billings, 2018](#)), can be understood in this continuum of resistance, as well.

In discussing the US context, [Lee \(1992\)](#) and [Reay and Mirza \(1997\)](#), [Mirza and Reay \(2000\)](#) investigate African-American activists' efforts for self-education during the period of slavery (1619–roughly 1883) as well as during the post-Reconstruction and post-slavery period (1865–1877). [Mirza and Reay \(2000\)](#) chart the establishment and presence of Black supplementary schools in the US, the UK, and elsewhere through the 20th century. [Lawson Bush \(2004\)](#) examines Independent Black Institutions (IBIs) in the US as far back as the end of slavery in 1863. These writings paint a powerful portrait of African agency and self-determination in education, despite facing significant racial injustice at the structural, systemic, institutional, and individual levels. Referencing [Anderson \(1988\)](#), Bush writes:

White northern missionaries were ... surprised by the will of the formerly enslaved Africans to educate themselves. Books or fragments of books were seen in the hands of African American men, women and children everywhere they travelled in the South.

[Bush \(2004, p. 387\)](#).

As we have noted ([Dei and Kempf, 2013](#)), Bush's work locates historical discourses, such as the Back-to-African movement, Pan-African movement, and Black Consciousness movements (and their leaders), as having tremendously impacted the establishment of many early African-centered institutions. In addition, [Rashid and Muhammad \(1992\)](#), in tracing the history of the Sister Clara Muhammad school (among the first Islamic schools emphasizing African histories and cultures), discusses the impact of Marcus Garvey's Universal Negro Improvement Association. Its motto of Black self-determination and racial pride became the foundational principle upon which the institution's pedagogy of liberation emerged as encapsulated in the message of knowing the self, loving the self, and doing for self ([Rashid and Muhammad, 1992](#)).

The development of schooling for racial justice generally and for Afrocentric education in particular has been an uphill battle against settler colonial and tacit White supremacist state bureaucracy. Due to changes to funding and political will, African-centered programs and institutions appear to have increased and decreased in number periodically, including a notable reduction in the US from 1890 to 1935, before rising again beginning in the 1980s. As mentioned, the US currently has more Afrocentric schools and programs than any other diasporic jurisdiction. Although exact numbers are unavailable, the number of schools seems to have been at their highest in 1999 at about 400 nationally ([Cohen, 2016](#); [Murrell, 1999](#)). By contrast, Canada has only a handful of schools and programs.

In addition to a lack of state and national data on Afrocentric schooling, numbers are also difficult to establish because not all schools that offer Afrocentric programming identify as Afrocentric schools. Not all Afrocentric schools offer the same degree of Afrocentric content: with some offering immersive approaches, and some offering culture affirming approaches, and most with local definitions and criteria for operationalizing such terms. There are different types of US Afrocentric schools, including private, public, charter, magnet, and other designations from pre-Kindergarten to upper secondary. Afrocentric schools frequently face a myriad of political issues, including chronic underfunding, under-resourcing, as well as racist public [mis]perception ([Dei and Kempf, 2013](#)). Given this variety, we cannot paint all Afrocentric schools with the same brush. However, we can see them all as manifestations of a larger Black struggle for Afrocentric agency in education and as part of the Black struggle for the spiritual, psychological, and academic well-being of Black children.

As we argue elsewhere ([Dei and Kempf, 2013](#)), this human thirst for learning explains the epistemological focus of the colonial project from literacy laws in the US, to forced segregation in schooling in Canada, to the forcible exclusion of African peoples from formal education in the Caribbean during the early European colonial era. In this sense, Afrocentric education as an idea, should not be understood outside of the context of this long struggle. To wit, we must avoid understandings of Afrocentricity and Afrocentric education that take an evental approach (looking only at individual moments, contexts, etc.), and instead invoke a longer view which recognizes the historical trajectory of scholarly activism and activist scholarship, by individuals, communities, and institutions fighting for racial justice centered on Afrocentric teachings and learnings.

Although Afrocentric education is reliant on particular philosophical tenets, it has grown out of the soil of resistance by African peoples to colonial and White supremacist education. So, in addition to the public and well-documented work of Du Bois, Garvey, and others we mention above, Afrocentric education also can be linked to tireless efforts of enslaved Africans who risked personal harm to themselves and family in order to hide books, who struggled to read hidden in the dark, and who made countless sacrifices

in order to achieve even basic formal education for themselves and their children. We now move to a discussion of the major tenets and philosophies of Afrocentric education.

Major tenets & philosophies of Afrocentric education

Although there is no singular philosophical proposition which defines Afrocentric education, or discrete list of beliefs offering a snapshot of Afrocentricity in its totality, there are central figures and themes without which an understanding of Afrocentric education would be impossible. Broadly, Afrocentric education can be understood as providing:

an avenue for ensuring the holistic education of African children in a way that nurtures their successful social, spiritual, and academic development [by aiming to] unite academic excellence and positive character, in order to foster an environment where interdependence, community and reciprocity are part and parcel the learning process.

Kempf (2015, p. 176).

Building on generations of activist and scholarly work dating back to the late 19th century, contemporary Afrocentric education scholarship in the US began to flourish alongside the establishment and development of Afrocentric programs, centers, and schools in the 1970s and 1980s.

The major tenets and philosophies of Afrocentric education emerged from the foundational works of Molefi Kete Asante, Maulana Karenga, Kofi Lomotey, Akwasi Akoto, Marianna Ani, Carol D. Lee, Peter C. Murrell, and Mwalimu J. Shujaa, to name a few. These authors work in the tradition of critical resistance to and rejection of mainstream Eurocentric schooling and its harmful impacts on Black children in terms of spiritual, academic, and psychological health. Their works are the building blocks of a counter vision of education, which centers, celebrates, and interrogates continental African as well as Diasporic African culture, epistemology, ways of being, and experiences.

The works of Molefi Asante, Kofi Lomotey, Maulana Karenga and Mwalimu Shujaa offer the central theorizations of contemporary conceptions of Afrocentric education. Asante, in particular, provides the core formulation of contemporary Afrocentric education in three seminal pieces: *Afrocentricity: The Theory of Social Change* (1980); *The Afrocentric Idea* (1987); and with specific significance for education, *The Afrocentric Idea in Education* (1991). The push for Afrocentric schooling has always been an act of resistance, and Asante's scholarship was no exception. Kendi (2016) locates the rise of Afrocentric theory in the 1980s alongside and in relation to Black studies programs, hip-hop pedagogy/education programs, and other African-centered academic offerings in US universities, in the context of a rising conservative movement focused in part on the promotion of tropes of Black criminality (p. 442).

Building upon the work of Woodson (1933), in *The Afrocentric Idea in Education* (1991), Asante identifies "two propositions that make up the background of the theoretical and philosophical issues" for which he is arguing (p. 170). First, he argues, "education is fundamentally a social phenomenon whose ultimate purpose is to socialize the learner; to send a child to school is to prepare that child to become part of a social group" (Asante, 1991). Second, he states, "schools are reflective of the societies that develop them (i.e., a White supremacist-dominated society will develop a White supremacist educational system)" (Asante, 1991). Recognizing the inherent White supremacy and Eurocentricity characterizing much mainstream teaching and learning, Afrocentric educational approaches "provide students the opportunity to study the world and its people, concepts, and history from an African world view" (Asante, 1991, 171). In the Afrocentric classroom, the Afrocentric teacher will not:

marginalize African American children by causing them to question their own self-worth because their people's story is seldom told. By seeing themselves as the subjects rather than the objects of education-be the discipline biology, medicine, literature, or social studies-African American students come to see themselves not merely as seekers of knowledge but as integral participants in it (Asante, 1991, 171).

Lee's (1992) writing on Afrocentric schools in the US offers an exceptionally clear and comprehensive summary of the aims of Afrocentric education. She offers an eight-point summary of these aims as follows:

1. Legitimize African stores of knowledge
2. Positively exploit and scaffold productive community and cultural practices
3. Extend and build upon indigenous African languages
4. Reinforce community ties and idealize [the concept of] service to one's family, community, nation, race and world
5. Promote positive social relationships
6. Impart a worldview that idealizes a positive, self-sufficient future for one's people without denying the self-worth and right to self-determination of others
7. Support cultural continuity while promoting critical consciousness
8. Promote the vision of individuals and communities as producers rather than as simply consumers (Lee, 1992, pp. 165–166).

Key here is the braiding of academic learning, morality, and ethics as equally significant pedagogical foundations within the Afrocentric approach. This is guided by the Kemetic proposition that moral social practice is necessary for the development of humanity (For more on Kemetic philosophy, Asante's *The Egyptian Philosophers: Ancient African Voices from Imhotep to Akhenaten* [2000], and Maulana Karenga's *Maat: The Moral Ideal in Ancient Egypt—A Study in Classical African Ethics* [2004] are essential and highly informative.)

Afrocentric education “aims to unite academic excellence and positive character” and to foster an environment where interdependence, community and reciprocity are part and parcel the learning process (Lee, 1992, citing Karenga, 1991). Afrocentric education is thus informed by Karenga's (1991) notions of Kwanzaa, which include faith, unity, purpose, creativity, cooperative economics, self-determination, and collective work and responsibility. The operationalization of these key principles is required for the successful realization of an Afrocentric educational program. It follows that the instructor or teacher is as important as the curriculum in the context of Afrocentric education. As Shujaa (1994) states:

When discussing African-centered education ... more emphasis should be placed on pedagogy than on curriculum. My reasoning for this is that pedagogy conveys the importance of the teacher to the education process while curriculum is too often reduced to documentation It is the African centeredness of the teacher's thinking that determines the African-centeredness of the teaching, (p. 265).

Thus, for Afrocentric education to succeed, as we have argued elsewhere (Dei and Kempf, 2013), teachers and educators must live, breathe, and be constantly engaged in the social philosophy and praxis of Maat (Lee, citing Karenga, 1991). Thus, there is a moral expectation of teachers. Reflecting on Karenga, Kempf (2011) provides the following overview of Maatian ethics:

Etymologically Maat is traced to notions of straightness and evenness. Drawing from a substantial literature on Maat, Karenga reveals its meaning as one signifying a guiding force, a cosmic order, truth, ideal wisdom, a metaphysical ideal and an epistemological ideal. As a wide-ranging concept, it expresses itself in four domains: (1) the universal—the totality of ordered existence; (2) the political domain—regulating justice and injustice; (3) the social domain—relationships and duty in the context of community; and, (4) the personal domain in which—following the rules and principles of Maat is to realize concretely the universal order in oneself (p. 102).

Maatian ethics are then a shared responsibility of the Afrocentric educator and the student studying within an Afrocentric program. This shared ethical stance is thus a required mutual starting point for Afrocentric teaching and learning, which recognizes the social playing field is not level and schooling is no exception; that learners' schooling identities are shaped by experiences, history, cultures, and socialization processes; that there is a link between these identities—race, class, gender, sexuality, disability, and other factors and how as learners and educators we come to know and engage schooling; and that every student's identity is relevant, in a productive sense, to his, her, or their learning.

From this philosophical launching pad, we can dive into the core approaches of Afrocentric education. Building on Dei et al.'s earlier (2000) writing on Afrocentric education, we sketch nine spheres of implementation for Afrocentric education: representation, language, family/community and school partnerships with a focus on shared responsibility, co-operative education, equity and values education, agency for transformation, Indigenous/community knowledges, spirituality, and learning for climate justice.

- (1) *Representation* refers to the visual culture/landscape of the school, knowledge representation of different bodies, and physical representation of diverse Black and other racialized educators and administrative staff who are well-grounded in their communities. This includes digital media and online learning activities and platforms, as well as race-conscious approaches to media literacy.
- (2) *Language* refers to the teachings of African and other Indigenous languages apart from the dominant local, regional, or national language. This domain engages questions of linguistic and the central importance of sustaining language, as well as an anti-colonial reading of the politics of language use.
- (3) *Family/Community and school partnerships with a focus on shared responsibility* refers to meaningful engagement with local communities as significant and valuable partners in the delivery of education to youth. This element recognizes the diversity in and between communities, and includes an explicit commitment to engaging the politics of a given school community context.
- (4) *Co-operative education* refers to education that stresses co-operative learning, multiple forms of student excellence, and doing away with hierarchical structures of schooling. This includes attention to the politics of cooperative vs. competitive approaches.
- (5) *Equity and values education* refer to the linkage of issues of power and social difference with schooling processes and knowledge production, and develops the learner's understanding of local agency.
- (6) *Agency for Transformation* refers to the development of students' ability to engage their communities and their broader world, as empowered and critically consciousness transformative agents. Building on spheres three and five, students are emboldened and empowered to understand and undertake responsibilities to his/her/their communities in pursuit of transformation for social justice.
- (7) *African Indigenous/community knowledges* refers to cultivating multi-centric knowledge systems in schools by affirming off-school and local cultural resource knowledge bases, as well as lifelong learning. This includes a recognition of the parallels and

distinctions of European colonial and settler colonial race paradigms which illustrates opportunities for solidarity and collaboration between African Indigenous peoples and other Indigenous groups.

- (8) *Spirituality* refers to evoking learners' understandings of the self, inner strength/environments and connections to the group and outer environments, as well as stressing the body-mind-soul interface, and the society-nature-culture nexus. This may have specific and/or general links to extant religious beliefs or practices of students and school families, but is not bound to or guided by any formal religious approach or tenet. This domain recognizes and nourishes the interlocking relationships which braid between academic, psychological, spiritual, physical, and cultural health.
- (9) *Learning for climate justice* refers to developing learners' critical understanding of global climate crises and the politics of climate crisis aggravation and mitigation. With clear emphases on African and African Diasporic perspectives, solutions, and struggles in global perspective, as well as attention to the relationship between colonialism and environmental destruction, this sphere promotes Indigenous African and other Indigenous and anti-colonial approaches to sustainability and climate justice.

Adapted from Dei et al. (2000).

Successful Afrocentric education across these nine spheres relies on the learner and the teacher being affirmed in all of their identities in order for holistic education to proceed. Among the most important tasks of Afrocentric education is to expose learners to the realities of society in a supportive environment that empowers today's youth to deal with societal pressures (racism, sexism, employment, family support, housing, etc.). This means teaching about race and racism, gender, disability, age, sexuality, language, religion, class, and other markers of social identity. The African continent itself cannot be understood through cultural reductionist paradigms. Similarly, the African Diaspora refers to a plurality of people, cultures, knowledges, histories, relations, and experiences. With this in mind, African-centered learning draws from a dynamic and fluid understanding of *Africa* and *African*, an understanding which evolves from the past, present and future, and which is constituted by African peoples of today as well as those who have come before.

There are both challenges and opportunities inherent to educational work in these domains. Challenges arise around a host of issues, including a scarcity of time and resources for teachers, questions of representation, debates on perspective and on what constitutes authentic African and/or Afrocentric knowledge, classroom community building, differences of opinion and experience, and the tensions that naturally arise in participatory education when working to honor a variety of voices and experiences which may include string rejections of formal education and the teacher. These challenges are not unique to Afrocentric education and, with the exception of time and resources, can be addressed over time through pedagogical practice.

We have attempted to offer a general overview of key philosophical tenets of Afrocentric education. Just as we caution against understanding Afrocentric education based on a particular school or formation, we suggest a look at its broad historical trajectory and situation. We also emphasize that, even guided by the principles above, Afrocentric education cannot be developed or imposed absent a robust engagement with the local context in which it is taking place. Afrocentric education begins with a recognition of contextual specificity—of the political, social, historical, geographical, and cultural contexts of a given educational setting. While Afrocentric education is (a priori) a site of struggle for racial educational justice, the specifics of different sites and the local contours of the struggle will necessarily vary. It follows that so too must each approach to Afrocentric teaching and learning. The tenets and philosophies outlined here are a starting point for engagement and application with specific local contexts. We turn now to a discussion of the contemporary implications and offerings of Afrocentrism for educational change.

Contemporary implications and offerings of Afrocentrism for educational change

Although we support the call for Afrocentric education, we do not propose to simply sweep away the current school system. We critique mainstream educational systems as a way to think through new and radical possibilities. We argue that the current school systems for most Diasporic Africans has been built on unstable foundations and could easily crumble unless we respond to its challenges. Clearly, there are redemptive qualities of conventional schooling and education, and we are not willing to give up hope and possibility of transformation. But we all (whether learners, educators, administrators, policy makers, etc.) must be prepared to listen to the uncomfortable voices asking for change because the school system is not working for all. The approach to new educational futures may well lie outside the current school system in terms of creating new forms of schooling and education (e.g., Afrocentric schools). However, it is an idea that we encourage rather than dismiss. We support the establishment and maintenance of new and existing Afrocentric schools within local vicinities and outside mainstream schools, beyond just additional curricular programming. These schools should be publicly funded because they serve the common good of the community. They should be neither implemented nor approached as separate, independent private schools. In a climate where a number of our youth do not find themselves in mainstream schools, we have a societal responsibility to put into action counter measures to address schooling and educational problems.

We also want to work with an "and/with" approach that looks at possibilities of educational transformation from within. This is not without its challenges and risks of disappointment, as this has unfortunately been the story of Black, Indigenous, and racialized communities. Afrocentric teachings are not just for Black and African youth. These teachings are useful for all students attending mainstream schools, as well. We want to turn the frustration of Black and African parents and caregivers and the long history of inaction on the concerns of Black education from an "either/or" situation to an "and/with" solution. On the one hand, we advocate for and support the creation of Afrocentric stand-alone schools in our communities as a possible way out of the educational "crisis"

for our youth while utilizing the lessons to improve mainstream schooling. On the other hand, we support a parallel educational approach. Absent of a complete revolution that tears down the current school system, we advance an argument for integrating Afrocentric teachings into mainstream schools to serve the needs of all students.

Historically, legitimate concerns have been expressed about the ability of current schooling to educate all learners for social success. We suggest Afrocentric education should seek and remain open to, new educational futures and approaches that can engage Afrocentric teachings, with particular implications for young learners of today. We acknowledge some attempts being made for our educational system to respond to calls for social justice, race equity, inclusion, and diversity. These attempts have manifested as modifications in body and knowledge representation, and in some situations an “overhaul” of school climate, environment, culture, and the socio-organizational life of schools. We are aware of the push for educational expertise that extends beyond critical Black and African Studies, to the paradigm of critical analyses of anti-Black racism and colonial violence against Black, Indigenous, and racialized learners (see [Ladson-Billings, 2018](#); [Roane, 2017](#), [Kendi, 2016](#), and others). We cannot discount the possibility of ideas to bring about educational change. And, we see power in the ideas promoted by Afrocentric education. These are the profound ideas of the Land and Earthly teachings of relationality, reciprocity, community building, mutual interdependence, social responsibility, and the pursuit of radical inclusion through a reclamation of local Indigeneities. The reclamation of cultural knowledges is the bedrock for the pursuit of decolonial and anti-colonial prisms of teaching, learning, and administration of education. Afrocentric education calls for more than responding to diversity, social justice, and equity in schooling. It is about re-envisioning education with a mindset and political practice to ensure that young learners are able to meet the changing needs of a globalized world.

The question of what concrete steps need to be taken to respond to primary and secondary education through Afrocentric schooling is a fundamental one. Schools must center local cultural knowledges in classroom teachings. History must be taught as a totality of all learners’ lived experiences. Education must be about Land and Earthly teachings, bodies, spirits, and minds in interactions. Educators and learners must be positioned to develop a more insightful, thought-provoking, in-depth, diverse thinking of schooling and education that have local, national, and international appeal and to promote global conversations about educational theory, practice, and policy changes.

Afrocentric education calls for asking “outside the box questions” to inform a theorization of the meaning and purpose of schooling. Learners must be equipped to ask questions that not only speak to their intellectual agency to design their own futures (e.g., public advocacy questions), but also implicate themselves in what is required to make educational change possible. Learners and educators must be engaged to develop lessons of our shared and contingent histories, experiences, and identities (which are not necessarily singular) to create a different path of educational futurity for all. Schooling must be pursued as an approach to education about building relationality, sharing, and connections to break the cycle of hierarchies and merit badges that reward individual competition over group efforts. The connections between schools and local communities must be strengthened in ways that bring parents, Elders, and local community workers into the schooling sphere to enhance youth learning. Elders can teach through stories, cultural songs, and mythologies. Education can also honor the contributions of our diverse communities in terms of global histories and world civilizations in ways that give power and agency to the learner to pursue individual goals and aspirations through collective and shared dreams. We can no longer continue to marginalize Afrocentric learning in the global politics of knowing, learning, teaching, and governing. We must rethink and restructure education to engage multiple knowledge systems.

Afrocentric education helps learners reclaim their humanity and anti-colonial consciousness. This means teaching about the colonial hierarchies of schooling, including the myriad oppressions, such as anti-Black racism rooted in an ideology of racial hierarchies and a denial and devaluation of African and Black life. We see White supremacy, anti-Blackness, and anti-Black racism as intertwining forces that have succeeded in denying Black humanity and presenting Black/African peoples as a “problem people/population” (see also [Hayes, 2003](#), p. 85). The rallying cry of “Black Lives Matter” is not new. It has been picked up by many, however, given growing frustration and anger with the ways in which Black bodies are easily dispensable and made disposable. In the Black Lives Matter social movement, questions of racial justice have intersected with other forms of social oppression, including disparities and discrimination in health, employment, housing, education, as well as land and environmental causes. Particularly for Black and African bodies, the collective consciousness around these issues must be strengthened through an Afrocentric prism.

We do not present Afrocentrism as simply an “academic theory.” It must be a weapon of educational change, recognizing young learners as the future with a collective capacity of the self-generated knowledge necessary for decolonization. The teachings of Afrocentric schooling spelled out in this chapter suggest making African knowledges about community, relationality, reciprocity, culture, spirituality, history, and Indigenous sciences core ideas in the pre-K-12 curriculum and beyond. This entails a multi-pronged approach to integrating and infusing Afrocentric ideas in all subject fields (i.e., arts, humanities, social studies, and physical sciences) and teaching subjects holistically (including, for example, analyses of power and the relevance of engaging first-hand accounts and stories of actual lived experiences of peoples). There are omissions and hidden histories that speak about social injustices, violence, and local resistances. These can be uncovered when we teach about colonization and enslavement critically to reveal White/colonizer privilege and violence as well as African and Indigenous resistance ([Dei, 2021](#)). This will require an Afrocentric schooling focus on precolonial Africa and cartographies of Indigeneities, African knowledge and philosophies.

In pursuing Afrocentric knowledge in schooling, educators must develop explicit lesson plans and curriculum units using diverse knowledge sources, local fables, stories, proverbs, and tales, as well as literature units on Black authors and engage the work of artists, educators, politicians, and community activists—young and old ([Dei and McDermott, 2019](#)). We need Afrocentric narration of histories from anti-colonial prisms and to center Black and African male, female, cisgender, queer, etc. identities and voices in telling their own stories ([Dei, 2021](#)). Education can de-root learners from culture, history, and politics. To challenge the

depersonalization of conventional schooling, students should be able to center themselves in their own learning. Afrocentric schooling has the capacity to help African learners reinvent their Africanness in a global Diasporic context. Furthermore, we need education to embolden learners to acknowledge and validate their respective histories, cultures, and identities as intertwined and interconnected. It is not enough to “learn to be Black or African.” It is more important for the learner to think through and to act on one’s Blackness, Africanness, and other forms of identity for collective social change.

Learners must be equipped to challenge White Eurocentric cultural norms, ideals, and social values in defining the global humanity and, in general, what it means to be “human” in a way that subverts the ideological tenets of Western individualism, freedom, liberty and choice. A neo-liberal corporate agenda has fostered a climate of competitiveness and a culture of hierarchy that works against the view of “schooling as community” and cultivating and a “community of learners.” The political economy of education must move beyond material, physical, and economic determinations to consider matters of the heart, spirit, and mind. This holds the key to educational and social transformation.

Conclusion

The future of Afrocentricity lies in educators and students realizing the need for a cultural and spiritual regeneration—a sort of ancestral rebirth and a way to reconnect consciously with a cultural heritage. Western education is at times overly skeptical about spirituality, and thereby risks interpreting spiritual ontologies as mythologies and non-scientific knowledge. We do so at our collective risk. We must promote multiple knowledge forms if we are to develop counter measures of schooling and education to address the current challenges faced by our school system. For many learners, spiritual and emotional knowings are relevant knowledge for their self and collective identifications. African and Indigenous learning has long been anchored in an ancestral rebirth of local communities across multiple geo-spaces on the continent and in global diaspora embracing histories, cultures, politics and identities. The ability to sustain Afrocentric education as part of the counter-visioning of schooling will depend on the commitment to a philosophy that centers the African humanity and its dreams and aspirations.

Since the 2018 United Nations Educational, Scientific and Cultural Organization (UNESCO) technical report on comprehensive sexuality education (CSE), there has been a global reckoning with issues around gender and sexuality (De Leon and Allegrante, 2020; Goldfarb and Lieberman, 2021; Krebbekx, 2019; Miedema et al., 2020). CSE it is argued remains an important aspect in a multi-levelled approach required to address gender relations of power, sexuality, sexual health and wellbeing (UNESCO, 2018). Schools have been identified as significant sites for the delivery of CSE across the young life course from early childhood through to young adulthood (Keogh et al., 2021; Le Mat et al., 2019). In the context of young people's continued vulnerability to early childbearing, HIV, inconsistent contraceptive use, gender and sexual violence, CSE remains an important component in school-based interventions to address young people's sexual risk (Goldfarb and Lieberman, 2021). The case for CSE remains compelling especially in relation to enduring gendered patterns where hegemonic notions of masculinity place limits on what is possible to become (Rollston et al., 2020). Beyond a risk reduction focus, CSE is expected to provide young people with knowledge, value and skills to understand and address relationship dynamics, sexual consent, enjoyment and pleasure while affirming young people's sexuality and desires (Kantor and Lindberg, 2020; Ketting et al., 2021). Advocates of CSE suggest that expansive topics in CSE including sexual debut, sexual pleasure and enjoyment are affirming of young people's sexuality (Herat et al., 2018; Kirby, 2011; Vanwesenbeeck, 2020). Notably, this expanding focus on gender and sexuality diversity also elaborates CSE's core content that addresses inclusion, respect and sexual justice (Herat et al., 2018; Miedema et al., 2020; Vanwesenbeeck, 2020). CSE is expected to promote positive ideas toward gender and sexuality diversity and an approach that recognizes the contextual basis and cultural relevance in the teaching and learning of new values and skills that support rights-based discourses. As UNESCO (2018, p. 16) notes CSE involves the development of values that will capacitate young people to "realize their health, well-being and dignity; develop respectful social and sexual relationships; consider how their choices affect their own well-being and that of others; and, understand and ensure the protection of their rights throughout their lives." As Kirby (2011, p. 12) states:

As the world is confronted with the largest generation ever of adolescents and young people, there is no time to lose in investing in their future by providing them with the information and skills needed to ensure their sexual and reproductive health over a lifetime.

While CSE's global commitment toward gender justice, rights and inclusivity are widely supported (Santelli et al., 2018), there are many challenges. Across the globe debates about how best to intervene in school-based CSE and protect young people's sexual health and well-being continues (De Leon and Allegrante, 2020; Iyer and Aggleton, 2015).

At the heart of CSE is sex and putting sex and sexuality together with children and young people remains problematic, despite evidence of the merit of CSE (Herat et al., 2018; Ramaswamy, 2021; Vanwesenbeeck et al., 2019). Deep-seated anxiety and discomfort prevail about young people's association with sexuality as taboo and culturally shameful. Conservative forces, religious norms, abstinence-only education and the idea of the corrupting force of sexual pleasure and enjoyment are antithetical to CSE. In this crucible, an idealized notion of childhood sexual innocence is pre-eminent shaping and reinforcing conservatism and resistance to CSE (Schalet, 2011). Blistering debates ensued over CSE in light of UNESCO's (2018) core content that seeks to enhance young people's knowledge of, sexual diversity, sexual pleasure and masturbation beyond the risk-focused sexuality education. Strong opposition from well-funded organizations such as *Focus on the Family* in the US (Moore et al., 2021), assembled together to attack CSE. This attack was premised upon the presumption of childhood sexual innocence, the core content of CSE was deemed to promote promiscuity, tainting healthy sexual development through its focus on the erotic aspects of sexuality.

In South Africa, the setting for this chapter, *#LeaveOurKidsAlone* comprising teachers and parents aligned with dominant narratives opposed to CSE. Chaskalson et al. (2019) point to the vitriolic ranting, the fears and panic produced through this hashtag, in relation to young people's exposure to "satanically" motivated education. CSE is not easy to implement. Facilitating CSE is difficult

as it necessarily engages with difficult conversations about issues such as gender inequalities, violence and male culpability in it, homophobia, sexual diversity and pleasure. The affective force of these issues is heightened in relation to young age and young people precisely because sex, sexuality and sexual knowledge are highly controversial issues (Egan, 2013). CSE is “work never done, unfinished business” requiring attention to the “cultural, and political” and the social and ideological contexts through which it is situated (Vanwesenbeeck, 2020, p. 1).

Despite the widespread recognition of the need for CSE to be culturally relevant and contextually specific, the interaction between young boys and masculinity appears to be overlooked in debates and interventions around CSE. More specifically, the ways in which boys in rural primary school contexts make sense of masculinity remains largely absent in thinking about the contextual significance of these meanings to the development of expanded understandings of gender and sexuality diversity. As UNESCO (2019) notes, CSE should be scientifically accurate, age and developmentally incremental so that knowledge may be progressively built upon to create learned behavior and attitudes, culturally relevant, human rights based, transformative, contextually, and culturally appropriate. Notwithstanding these imperatives, a major gap in understanding the situatedness of gender and sexuality remain especially among younger boys in primary school settings. This chapter makes a case for addressing how young boys produce masculinity as a culturally exalted expression of manhood while limiting the expressions of gender and sexuality diversity. “CSE has to be culturally relevant and inclusive is increasingly recognized as a fundamental aspect of supporting young people to live healthy sexual lives,” as noted by Coultas et al. (2020, p. 1).

By drawing from new feminist materialism (Fox and Alldred, 2013; Fox and Bale, 2018), the chapter shows how different expressions, forms and content assemble together to both constrain and enable masculinity. Before engaging with the masculinity assemblage, the chapter considers the context within which masculinity is produced.

Masculinity, culture and context

This chapter brings together boys’ account of masculinity within a distinctively rural context where compliance with cultural norms is more evident than in urban settings (Hunter, 2010) and through which a culturally hegemonic form of masculinity is exalted (Connell, 1995). Customary practices have a strong foothold in the construction of masculinities in South Africa. Attention has been given to the ways in which masculinity, heterosexual domination, misogyny and violence cohere around hegemonic masculinity (Morrell et al., 2012). An understanding of hegemonic masculinity draws mainly from Connell (1995, p. 77) and defined as “the configuration of gender practice which embodies the currently accepted answer to the problem of legitimacy of patriarchy”. Hegemonic masculinity, following Connell (1995) can be viewed as a dominant version masculinity within a socio-cultural setting where male power is exerted over women and non-gender-conforming men. While there has been critique against this understanding of power based on domination and subordination and the typologies created between hegemonic masculinity and other forms of masculinity (Connell and Messerschmidt, 2005), hegemonic masculinity has shaped much of South African research on men and masculinities (Jewkes and Morrell, 2012). In this research careful consideration is given to the dynamic nature of masculinity and the value of understanding its cultural contextualization (Mfecane, 2018). Drawing on the concept of masculinity, it is possible to understand male power as an investment in customary practices and patriarchal norms which has produced inequitable gender practices and disparagement of gender non-conforming. In this regard and beyond the static account of domination and subordination, attention to the contextualization of race, class, sexuality, gender and cultural norms in the production of masculinity remain important work in delineating the specific experiences of masculinity (Ratele, 2016).

Within the KwaZulu-Natal region of South Africa, customary practices are actively negotiated in relation to gender and generational hierarchies. Historically power was vested in a system of chieftaincy where age and gender coalesced to produce reverence for older men who held power. In this system younger men, women and children were deemed to have less control in relation to gender and generational hierarchies (Hunter, 2010). These cultural practices are not static but in rural contexts they remain more widespread than in urban settings where fragile family structures has loosened the grip on these norms (Hunter, 2010). In many rural contexts, customary practices are underlined by male power, heterosexual domination and gender inequalities. *Hlonipha*, for instance is based on the concept of respect and deferential disposition toward the male head of the household. Masculine power derives from the system of chieftaincy, the historical emphasis placed on male economic power which was leveraged through cattle, the creation of a household, having many children and polygamy (Moore, 2015). Marriage was negotiated through the payment of *ilobolo* (bridewealth) where 11 cows were usually paid by the groom to the virgin bride’s family (Wickstrom, 2010). Virginity was thus prized. Hegemonic versions of masculinity have historical and material roots and takes shape at the intersection of heterosexuality, gender and cultural norms.

In describing masculinity in relation to these intersecting forces Mfecane (2018) suggests that the ways in which masculinity is produced in local settings is based upon customary practices. Indeed, cultural expectations around *hlonipha* (respect), *ilobolo* (bridewealth) and male role and expectations within rural settings provide a rich context of the ways in which boys negotiate masculinities. Within these broader social and cultural settings, patriarchal norms regulate sexuality in ways that sustain the notion of homosexuality as “un-African” (Epprecht, 2018; Msibi, 2018). While this essentialist understanding of sexuality has been critiqued, what is necessary here is that these binary positions between heterosexuality and homosexuality serve to uphold hegemonic masculinity. As will be shown in this chapter, an investment in culture and cultural practices is a signifier of masculinity and the presumption of heterosexuality and through which non-gender conforming others are subjugated.

It is in this context, that CSE operates. If CSE is to be driven by local realities then attention to the ways in which masculinity and sexuality are negotiated and grappled with remain important work. Significantly, the cultural setting and context is also one in which traditional customary practices sit alongside opportunities for the expression of rights. Cultural norms are changing and changeable and the transformative potential in thinking about masculinities and culture beyond the heterosexual imperative remain possible.

Theorizing masculinity beyond hegemony: thinking through assemblages

In this chapter I seek to expand how we currently theorize and understand the operation of young masculinity by highlighting data from focus groups with primary school black boys in a rural school in KwaZulu-Natal province of South Africa. The boys are aged between 11 and 13 years of age and emerge from rural settings which are historically produced in relation to race and class. While [Connell \(1995\)](#) has provided important understandings of masculinity within frameworks of social constructivist thinking, such structures in the absence of materiality seek to restrain the production of knowledge when the social and material world are separated. Drawing from new feminist materialism, this chapter illuminates the connection between the human and meta-physical world through the operation of assemblage theorizing ([Van der Tuin, 2011](#)) in order to account for the socio-material-cultural connections that are made in the production of masculinity. Cultural norms such as *inhlonipha*, practices, sexuality, rituals, *ilobolo*, masculinity, rurality, ideas, and thought are all in a continuous entanglement with the human body. Beyond the binary established between hegemony and subordination, a materialist perspective suggests that all elements, expressions, forms and context intra-act in the production of sexuality and masculinity. Material agency is not specific to boys' agency but operates within an assemblage as entangled and interconnected actors that support meaning about masculinity. Within new feminist materialism, an engagement of matter through social actions and events constitutes the assemblage that consequently produces capacities to affect or be affected by other forms and elements ([Deleuze and Guattari, 1987](#)). The term assemblage as coined by Deleuze and Guattari illustrates the rhizomic network of social life which is made up of "semiotic flows, material flows, and social flows simultaneously" ([Deleuze and Guattari, 1980/1987](#): 22–23). The assemblage is dynamic and is constituted in relation to moment to moment formations of elements and bodies which create flexibility and movement. When boys connect ideas, culture and masculinity with the body, they do so in ways that draw from the assemblage that is contextually situated. Therefore, local practices around men and masculinity remains powerful in affecting how power is validated. However, since the assemblage is unstable, it can also open up possibilities to change and become something other. We can thus understand how boys make sense of masculinity as a process of becoming going through material, social and semiotic flows of movement. Matter and meaning are thus entangled with materiality and the body. The continuous state of flux within an assemblage is therefore illustrative that aspects of masculinity cannot be reduced to the body but is produced relationally as the assemblage navigates to encounter other matter within its context. All matter within the assemblage has agential capacity to affect ([Barad, 2003](#): 181). Affects link matter to other matter. While the assemblage is dynamic and changing, the network based on its particular form and elements can also reinforce connections. In this chapter, the reinforcement of hegemonic masculinity based on cultural norms and practices are part of the habitual connections being made to constrain the assemblage and restrict masculinity to male power, hegemony and heterosexuality.

[Hickey-Moody \(2019\)](#) understands masculinity as the operation of affects, capacities and assemblages within [Butler's \(1988, 1993\)](#) notion of performativity. In other words, masculinity can be seen as a performance—a repeated stylization of the self- or as noted above as habitual. This does not mean that masculinity is fixed. Rather it is more-than-human and exists in relation to different sets of ideas, thoughts, bodies, culture, and practices. Affects challenge the habitual and repetitive stylization of identity and thus through affect assemblages are changeable within a particular context. In this regard [Hickey-Moody \(2019: 50\)](#) suggests that masculinities "are a creative, non-human force with no allegiance to the male body other than its capacity to affect it or be affected by it". The boys in this study are always becoming in/through the assemblage and are able to affect rather than limited by the embodiment of masculinity. By focusing on what boys can do and how they are constrained, the chapter entwined within a new materialist lens opens up possibilities for thinking about ways to reconfigure masculinity and sexuality in ways that support gender equitable relations and change.

In situating CSE within this complex making of masculinity and sexuality, the chapter develops an understanding of the entanglement of CSE with boys' actual lives and through which we can begin to understand how important it is to work through the constant process of becoming, the constraints and habituation in meaning and also the possibilities for rupturing the assemblage. This theorizing will offer new complexity in thinking about heterosexuality, CSE and gendered binaries within localized settings. Simply put, CSE changes from one setting to another and in each new assemblage different things manifest to shape sexual futures. In doing so, the chapter argues for cultural and contextual relevance in understanding CSE and for imperative of different strategies and support to advance the goals of CSE.

Community, culture, ceremonies: masculinity and heterosexuality

In this section, following a new feminist materialist insight, I seek to show how the assemblage operates in the production of heterosexual masculinity constraining the spaces for the expression of gender and sexuality diversity. Boys' ideas, thoughts and bodies are caught up within the cultural assemblage—which affect and is affected by a range of other elements within the assemblage. In

describing a “real” man in their rural community, the boys brought together ideas around gender discourses and hegemonic masculinity, associated with being dignified and manly. Specifically, as I will show the boys in this context, drew attention to cattle and livestock, herding, cultural dances, invoking the spirits of ancestors and slaughtering goats as culturally normative of masculinity and heterosexuality.

Following Hickey-Moody, masculinity is more-than-human. Building on new materialist (van der Tuin, 2011) ideas concerned with how matter interacts with thoughts, ideas and how it interacts, affects and is affected by other elements, masculinity is seen as a becoming rather than a fixed construct or restricted to its embodiment. To shed light on the interactive elements within the assemblage, the boys draw attention to particular capacities that engender particular ways of being based on hegemonic notions of masculinity:

Andile: He has to follow tradition and practice our culture ... and also be able to take care of his family ... and be able to do traditional rituals.

Bonginkosi: Men need to do these things because it was done this way by our forefathers ... and how men show that they are men.

Buyisiwe: Yes, I also agree that it is a law that is placed by the chief and the people who lived in this community before we were born.

Within the cultural assemblage, tradition, cultural practices, reverence for ancestors and the power of the chief are brought together to reinforce a version of masculinity based on hegemony. As Hickey-Moody (2019, p. 1) indicates masculinity is “taught and learned through embodied and symbolic sets of practices that take place in a range of places and are distributed across often quite complex networks”. In South Africa, Mfecane (2018) delineates these complex networks that include connections with ancestors suggesting the significance of spiritual identities within a broader set of gendered networks. This gendered network operates alongside kinship relations, traditional rituals, respect for the chief of the area and relations with the ancestors. The assemblage thus ignites a complex network through which hegemonic notions of masculinity are legitimated while excluding the possibility of becoming other. As Connell (1995) says, this idea of a culturally exalted form of masculinity generates pressure and anxiety about failing to achieve this idealized version of masculinity:

Dingani: For me I would say it means being a good example within your community and be a good example at home ... to keep your dignity as a man when you are amongst other men ... it means behaving like a man ... and also not being a *stabane*[gay] ... you must not behave like a *stabane* because behaving like that will not preserve our culture ... do the things that are expected to be done by men in the community.

Failing to be a “real” man has consequences and is stigmatized. In this assemblage, Dingani, brings together community prescriptions around gendered conduct with male dignity and culture while setting real men with dignity in opposition to “*stabane*”. In other words, the affectivity of these relations produces particular capacities that engender Zulu masculinity while disparaging “*stabane*”. Butler (1993) states that there is nothing real about masculinity, neither is masculinity based on individual agency. What is evident through the boys’ responses is that masculinity an “an embodied practice of citation” (Butler, 1988, p. 13). The cultural citations suggest the deep connection with context and the ways in which masculinity is produced in relation to community and cultural norms. The assemblage thus operates as a complex set of elements that come together, collectively to perform a version of masculinity that is reproduced in relation to cultural ideals. As Hickey-Moody (2019) indicates, masculinity can be viewed as an assemblage connecting people, matter, ideas, context and acts that are seen to be masculine. These materialities are relational and thus masculinity is contingent on matter, bodies, things and ideas in the assemblage where *stabane* is viewed as weak and othered:

Mandlenkosi: They [community members] don’t see him as a complete man ... they are suspicious of him ... they don’t regard him as a dignified man ... they see him as a weak man ... the people from that community don’t trust him ... they don’t trust that he is a real man ... he is a weak man like a *stabane* ... I think they don’t invite him during important cultural ceremonies in the community because he does not do what other men do ... He ends up not knowing his culture because ... because he doesn’t partake in cultural ceremonies with other men and also ... and also if he has children his children grow up not knowing their culture.

Within the masculinity-assemblage, community, culture, ceremonial practices, social standards around gender, ideas about weakness incapacitate particular identities such as “*stabane*”. In other words, becoming a man is part of the assemblage in which the capacity to be is intensified through community solidarity, cultural affiliation with ceremonial practices and strength. The assemblage produces a narrow conception of masculinity while aggregating thoughts, ideas and bodies within normative account of manhood. In doing so, the assemblage reinforces male power, disparages alternative forms of sexuality, and constraints possibilities to become other when heterosexual masculinity is upheld.

Throughout the study, the boys referred to the persistent power of Zulu cultural norms in the community for explaining the legitimacy of heterosexual masculinity. Culture, community and gender norms coalesce to produce “authentic” Zulu masculinity

Bhekani: I would say being a man means having a lot of cattle ... being able to herd ... and him being able to take care of this livestock ... I think he must know how to do our cultural dances like *indlamu* so that people can see that there is a man in that family ...

Cattle, care, masculinity, cultural dances and heterosexual family unit interacts with each other, affects and is affected by other materialities to produce manhood and real Zulu masculinity. In other words, Bhekani puts to work the gender binary within the assemblage in order to manifest real heterosexual masculinity. In making these associations between human and more-than-human elements, social-material-cultural relationalities are produced reinforcing Zulu masculinity in opposition to *stabane*.

While there is nothing essentialist about Zulu communities, the assemblage is produced in relation to a strong sense of community and interdependence which subjects masculinity to a particular kind of gendered patterning. In many rural contexts in South Africa, interdependency ties communities together underpinned by the African philosophy of *ubuntu*—a humanity toward other people in the community (Piper, 2016). The operation of culture, gender and community entanglement within the assemblage suggests how masculinity is made to be intelligible through the cultural norms which binds people together in a common sense of humanity. The assemblage is thus an intricate complex network of relations and affects and is affected by other elements within it. Being a real man is intertwined and interdependency operates within a web of relations that reflect the broader community. A person’s humanity rather than existing in individualist ways, show strong collectivist characteristics (Mkhize, 2006). As Rudwick and Posel (2014, p. 123) suggest, “the proverb *umuntu ngumuntu ngabantu* (a person is a person because ... other people) captures the importance of relationships with family and friends in Zulu society ... the frequent saying *bazothini abantu* (what will the people say) describes a deep concern with other peoples’ thoughts and opinions.” Underlined by an interweaving connection between family, community, culture and gender, the boys explicitly link men and masculinity with ascribed gender roles and with cultural norms sanctioned and regulated by broader community. As a theoretical tool new feminist materialism accounts for the varied and intricate ways through which human and more-than-human forms come together to produce meaning that is tied to the embodiment of masculinity alongside larger cultural contexts.

A unifying feature of much of this, is the power men wield within gender relations and in the context of Umgababa it is clear the power they wield in community dynamics. As Hearn and Morrell (2012) note, gender operates within social groups. In the context of Umgababa, community values, as the boys elucidate prescribe particular patterns of behavior which include participating in cultural ceremonies and rituals informed by male power. The boys use cultural norms as a mechanism to reinforce heterosexual masculinity, and defended through rituals and practices evident in the rural community. Furthermore, these norms are also magnified by Dingani through sentiments such as “you mustn’t do anything that is different” not doing anything that is different within this closely-knit rural community, maintains communal customs and renders a male individual “a dignified man”.

Bongani in the transcript below provides further clarity in this regard:

Bongani: I would say he has to know how to speak to the ancestors ... he must also know how to slaughter a goat and also attend cultural ceremonies ... because I saw it being done that way here in the community and also being done by the men in my family as well ... and also because things need to be done that way in order to preserve our culture.

The preservation of culture, the deep co-existence and collective relations between family and community are described by Bongani informed by and premised upon heterosexual masculinity. The cultural ritual in speaking to ancestors is associated with several aspects of daily life including birth, death, illness in seeking protection, guidance and validation from ancestors for community health and wellbeing (Mfecane, 2018). According to Mfecane (2018) patriarchal ideals assign older males within families the responsibility for “speaking” to the ancestors. Messages from the ancestors to the community are relayed through dance, songs and invoking the spirits of the ancestors by uniting the concrete real world with the spiritual world based on bringing wealth, health and well-being to the community (Mfecane, 2018). The male role in renewing community well-being is interdependent upon heterosexuality, male power and reproduction of cultural norms.

Another participant, Mandla referred to a man’s role during funeral proceedings to highlight male responsibility in facilitating numerous cultural aspects that are involved with conducting a funeral:

Mandla: For me he needs to know how to dig a grave when there is a funeral and also know our cultural funeral proceedings.

Despite women performing a pivotal role during the funeral proceedings, the cultural assemblage places men at the forefront to lead funeral planning and processions. The powerful role of men during funeral proceedings is assigned importance due to the physical exertion involved in digging the grave, if the deceased is to be buried in a rural area (Ngubane, 2004). Furthermore, men

are also assigned the leadership role during funeral proceedings because they are responsible for slaughtering animals (goat or ox/cow) before the night vigil, on the day of the funeral and a few days after the funeral for the cleansing ceremony (Ngubane, 2004).

The assemblage connects boys, matter, ideas, gendered discourses, communities, contexts, ceremonies, culture and cultural practices within an interlocking grid through which Zulu masculinity is produced. As Hickey-Moody (2019) suggests masculinity, matter and thought are not separate from each other.

Ayanda: ... he has to have a wife ... and also be able to have children ... he must have money for *ilobolo* [bridewealth] ... a man must follow the rules that were made by our elders ...

Ayanda brings attention to the heterosexual compulsion, marriage and cultural norms involving *ilobolo*. *Ilobolo*, as a customary practice informs marriages and is deeply rooted in the performance of heterosexuality where male economic power and provider masculinity is validated. Customary marriage practices while changing revolves around negotiation of *ilobolo* where the groom is expected to negotiate a payment (either in cash or cattle) with the family of the bride. Thus, the cultural assemblage invokes provider masculinity, kinship relations, and respect for elders ensuring the reproduction of cultural norms while limiting the capacity to become other.

While the assemblage is constraining, it is also in flux and changing. As noted by Deleuze and Guattari (1987), affects produced in the assemblage can “affect and be affected” producing shifts and changes. In this regard what can boys do in challenging the cultural assemblage through which idealized versions of masculinity is produced. Within new materialism, affect is a powerful concept which suggests that bodies, ideas, thoughts are changeable and emerge within social-material forces.

Bandile: ... there are many people that live a different life than the way others live ... and some people don't do cultural or traditional rituals because they don't believe in them ... There is nothing wrong if they don't do it because everyone must do what they want to do ... they must not be forced to do things that they don't want to do.

Bongani: It's their [gay people's] right to do things that they like or want to do ... they shouldn't be forced to do things that they don't want to do because they also have rights ... so the other men that are different should also be allowed to live their lives even though they are seen as different.

Following Deleuze and Guattari (1987), Hickey-Moody (2019) suggests that masculinities can be seen as creative with a capacity to affect and be affected. What is evident in the above is the flux and change. Within an assemblage that is constraining on capacities to become other, restricting the expression of gender and sexuality diversity, rights and instability of culture ignite new ways of thinking as this thinking aggregates matter with other matter in the assemblage (Deleuze and Guattari, 1987). Cultural norms aggregates bodies within a defined understanding of masculinity and therefore constraints. However, this is not fixed. Ideas around rights, the dynamic nature of culture point to the flexibility in thinking about masculinity and the heterosexual imperative as unstable. Masculinity is fluid and relational and becoming other interacts with rights discourses to expand sexuality in ways that go beyond heteronormativity. In other words, bodies are always becoming in/around assemblages (Renold and Ringrose, 2011) which create capacities to affect and be affected.

Conclusion

By addressing, young boys in the primary school as they make meaning of masculinities, the chapter has highlighted the cultural relevance and contextual specificity in addressing gender and sexual norms in CSE. The analyses has shown how habitual and repetitive patterns within the assemblage exalt a culturally specific form of masculinity which draws from a range of ideas, thoughts, gendered discourses, bodies, cultural practices, ceremonies, rituals and includes the broader social and cultural structures through which “real” men are idealized. By drawing on theoretical tools from new feminist materialism, the chapter has shown how ideas, thoughts, rituals, bodies, ceremonies, cultural practices, chieftains, ancestors, cattle produce specific capacities that make specific identities possible while limiting others. Being a real man thus emerges from the complex production of affective relations within the assemblage (Fox and Bale, 2018). Specifically, the evaluation of the assemblage shows stereotypical views portrayed around men and masculinity because definitions hinge upon male strength, power, male as the head of the household while associating cultural rituals, practices, ceremonies to masculinity thereby subordinating both femininity and expressions that go beyond heteronormativity. Stabane, was deployed as a stigmatizing category and remained othered within a cultural collectivity based on the heterosexual imperative. Culture was used as strategy within the assemblage to reinforce claims to an “authentic” Zulu masculinity by aggregating bodies, rituals and cultural practices into prescriptive understandings of gender and sexuality. Thus, the potential to become other is limited. However, the assemblage is always in flux and different elements, forms of expression and content has the potential to move bodies in different ways. In some instances, the assemblage was ruptured by rights discourses and ideas around

difference and the flexibility around culture suggesting small openings toward new ways of thinking about men, masculinity, heterosexuality and culture.

For CSE, this study illustrates the importance of understanding the contextual specificity and cultural relevance in primary schoolboys' sense making of men, masculinity and sexuality. I argued that local concerns, sensitivities and affects around culture and customary practices shapes how CSE is viewed and is an "absolute necessity for multicomponent approaches as part of CSE implementation" (Vanwesenbeeck et al. (2019, p. 297). Boys' negotiations of gender and masculinity need to be centered in understanding the cultural relevance of CSE. The approach taken in this study, drawing from new feminist materialism, is that masculinity is the capacity to affect and be affected. CSE is produced within an assemblage where masculinity is not located in genital capacities but in relation to ideas, gender discourses, chiefs, heterosexual family, ancestors, cultural practices, ceremonies, cattle, and these different forms and elements come together with their own capacities to affect one another. For example, a man is expected to marry, have children, perform cultural practices and participate in ceremonies in ways that delineate specific capacities associated with being a man. An approach to CSE that recognizes these multifarious elements (human and more-than-human) is necessary to illustrate the complex range of things and ideas that come together to give meaning to masculinity. In this way, culturally relevant interventions will recognize how particular assemblages are produced under specific contexts and circumstances. This will require questioning of and rethinking the social-material-cultural nexus through which the assemblage is formed. Questions about particular cultural norms which are both problematic for women and expressions of gender and sexuality diversity will be required. While CSE cannot tackle culture on a large scale, more can be done to recognize the ways in which homophobia, gender inequalities and male domination are reproduced as young boys attach culture to masculinity which offer little scope to expand potentials for becoming other. CSE must be understood in local settings by creating the space for boys (and girls) to develop their own narrative, ideas and themes that they consider to be important.

The acronym LGBTQIA (lesbian, gay, bisexual, transgender, queer, intersex, agender/asexual) has become increasingly commonplace in the context of schools, if not fully embraced as a legitimate focus of educational research and attention. A comprehensive discussion of LGBTQIA school-related topics could fill an entire set of encyclopedias. Therefore, to adequately address the topic and avoid overgeneralizing, we focus on contemporary public schooling in the United States. This chapter responds to the questions: How have LGBTQIA students and educators experienced schooling in the United States? And, what are the outcomes of those school experiences for LGBTQIA individuals and communities?

In contrast to some other nations where education is under federal control, the United States' education system is controlled by states and localities. In the United States, the federal context provides some broad mandates, such as prohibiting discrimination on the basis of sex under Title IX of the Education Amendments of 1972, while still allowing for state discretion over education decision making. This state-based system results in variations across states; however, there are also observable nation-wide trends. We identify and describe two broad societal trends that have influenced the treatment and experiences of LGBTQIA students and educators in the United States over approximately one hundred years of contemporary schooling: (1) the treatment of LGBTQIA people as deviant and diseased and (2) increased visibility and protections for LGBTQIA people.

This chapter is limited in two regards. First, the need for brevity constrains the chapter's depth and breadth. Second, the extant scholarship on LGBTQIA school experiences has primarily focused on cisgender white men, eclipsing the experiences and histories of Transgender, Black, Indigenous, and People of Color (BIPOC). Despite these limitations, this encyclopedia chapter can serve as an introductory resource that invites further examination of how LGBTQIA identities intersect with other marginalized identities within the categories of ability, citizenship, class, ethnicity, race, and religion.

We begin by defining key terms and concepts as a way to reduce misconceptions about LGBTQIA people. Next, we describe each of the two societal trends that have influenced LGBTQIA students and educators. The first and most enduring trend reflects longstanding efforts to portray and treat LGBTQIA individuals as deviant and diseased. The second trend is characterized by increased visibility and protections for LGBTQIA people. We conclude with a discussion of what it might look like if schools were places of equity and liberation for LGBTQIA students and educators.

Terms and concepts

Misconceptions about LGBTQIA people can lead to mistreatment and discrimination. To reduce misinformation, we start by explaining the difference between sex, gender, and sexual orientation, three concepts that are commonly conflated or confused.

The predominant view of biological sex in the United States emphasizes two binary categories, male and female, which are commonly conveyed as mutually exclusive and easily identified based on external genitalia. From a scientific standpoint, however, sex is actually a complex combination of hormones, chromosomes, and anatomy. People with physiological characteristics that do not align neatly with the biology ascribed to males and females are known as intersex. *Intersex* (I) is a broad category that includes

people with such physical, hormonal, and/or chromosomal characteristics, such as hyperandrogenism or XXY chromosomes. Intersex people account for approximately 1.7–2% of the population (Blackless et al., 2000), similar to the percentage of redheads. Despite the variations that occur across humans, legal documents in the United States almost exclusively require either F (female) or M (male) sex designations. As a result, sex takes on both medical and legal aspects that are regulated by federal and state-level government entities. As a medico-legal category, the criteria used to define and determine sex can differ based on legal context and not solely on the basis of biology or medical expertise.

Gender is an internal sense of identity and, like sex, it is commonly understood as a binary—girl/woman or boy/man. Expectations about how boys and girls should express their gender are highly dependent on societal norms and can change across culture and time. When an infant's sex is assigned at birth, gender norms are also presumed. For example, it is generally expected that babies assigned male at birth will develop gender identities as boys and men. People who experience congruence between their sex assigned at birth and their gender are known as *cisgender*. *Cisnormativity* is the belief that cisgender identities are preferable over other gender identities. People who experience incongruence between their sex and gender are broadly understood as *transgender* (T). Transgender, sometimes written as *trans*, is an umbrella term that can include a wide variety of gender identities and expressions. Some trans people conform to binary gender norms albeit for a different sex from the one they were assigned at birth. Some transgender individuals challenge gender norms, expressing themselves in ways that defy stereotypes for boys/men and girls/women. Recent research suggests that 0.6% of people 13 and up and 1.4% of people 13–17 identify as transgender (Herman et al., 2022). People for whom gender is not a salient identity may identify as *agender* (A).

Transgender and gender-expansive people refer to themselves using a wide range of terms, including but not limited to *AFAB* (assigned female at birth), *AMAB* (assigned male at birth), *enby*, *nonbinary*, *gender fluid*, *genderqueer*, *agender*, *transmasculine*, *transfeminine*, *gender expansive*, or simply boy, man, girl, or woman. The language people use to represent their gender identity is highly personal and it is important not to make assumptions about someone's gender identity based on their gender expression—outwardly visible behaviors and appearance such as clothing, hairstyle, or mannerisms. For more information on gender see works by Lee Airtion (2018), *Gender: Your Guide: A Gender-Friendly Primer on What to Know, What to Say, and What to Do in the New Gender Culture*; Melinda Mangin (2020) *Transgender Students in Elementary School: Creating Affirming and Inclusive School Cultures*.

Sexual orientation refers to patterns of romantic, emotional, and physical attraction that contribute to sexual identity. Attraction often depends on how we “read” another person or interpret their gender expression, not necessarily based on their biological sex. In the United States, some common terms used to describe sexual orientation include *gay* (G), *lesbian* (L), *bisexual* (B), *asexual* (A), and *straight*. The term *gay* describes someone who is attracted to people of the same sex/gender. *Gay* can be used for both men and women; however, sometimes women prefer the term *lesbian*. The use of *homosexual* for gay people should be avoided because of its linkage to homophobic ideologies and stereotypical notions such as sexual promiscuity among gay men. *Bisexual* refers to individuals who are attracted to both males/men and females/women. *Asexual* describes a person who is not sexually attracted to other people but may still have a sexual libido. *Straight* refers to someone who is attracted to people whose sex/gender differs from their own. This is formally known as heterosexuality. *Heteronormativity* is the belief that heterosexuality is preferable over other sexual orientations. Another increasingly common term is *queer* (Q). Originally, queer was a synonym for “peculiar” and was used as a slur for gay and gender-expansive people throughout the twentieth century. In the 1980s LGB activists deliberately began to use queer to describe themselves. Reclaiming words that were once pejorative is a way for marginalized groups to assert socio-political agency. Today, LGBTQIA people increasingly identify as queer and in this chapter we use queer interchangeably with LGBTQIA.

In addition to LGB, other more nuanced terms are increasingly being used to describe sexual orientation. The growth in language related to sexual identities reflects new understandings that binary representations of sex and gender fail to convey the richness of human experience. For example, *pansexual* describes someone who is attracted to the entire array of people regardless of their sex or gender identity. *Polysexual* people are attracted to multiple genders but not all genders. *Demisexual* refers to someone who experiences sexual attraction only to people with whom they have an emotional connection.

The acronym LGBTQIA is an alliance of marginalized identities from across each of these three concepts: sexual orientation, gender, and sex. Alliances can help oppressed groups of people build social, political, and legal influence. In cisnormative and heteronormative contexts, where cisgender and heterosexual identities are consistently privileged over LGBTQIA identities, such alliances convey a shared history of oppression and can help protect against hostility and discrimination. For people with multiple marginalized identities from across categories like ability, citizenship, class, ethnicity, race, and religion, the adverse effects of cisnormative and heteronormative contexts are magnified. To be queer in school means facing the same cisnormative and heteronormative beliefs that characterize our larger society.

LGBTQIA people as deviant and diseased

In the United States in the 19th and 20th centuries, the legal and medical fields played a key role in reinforcing cisnormativity and heteronormativity. In this section, we describe how the legal criminalization and medical pathologization of LGBTQIA people

positioned them as deviant and diseased and rendered queer people invisible, restricting their access and agency in society. In this section, we also show that positioning queer identities as deviant and diseased ultimately influenced efforts to erase queer people from public schools throughout the twentieth century.

Legal criminalization

Identities and expressions other than cisgender and heterosexual have been criminalized for most of the United States' history. Legal scholar William N. Eskridge describes this history in *Dishonorable Passions: Sodomy Laws in America, 1861–2003* (2008). He explains that the legal system of the American colonies, and later the United States, included laws that attempted to regulate sexual intercourse as an act of procreation between married heterosexual couples. For example, anti-sodomy statutes prohibited sexual intercourse between consenting adult men and vagrancy laws prohibited engaging in or soliciting sex with others in public. These laws were increasingly enforced beginning in the late 1800s when purity movements, or efforts to control sexual behavior, gained traction. Eskridge explains that, by the 1920s, arrests increased tenfold in many areas, as did the widespread policing of sexual behavior particularly around sexual interactions between men.

By the late 1940s and 1950s, panic around sexual acts between two men became even more heightened with what has been referred to as the Lavender Scare. Public discourse and dominant narratives presented men who had sex with men as immoral, indecent and as a threat to national security. McCarthyist style policing ensued. Politicians, journalists, and citizens endeavored to find and remove these men from the public, particularly in the workplace. One such purge included President Dwight D. Eisenhower's signing of Executive Order 10450, which allowed the federal government to deny employment to lesbian and gay people (Johnson, 2009).

The 1960s and 1970s ushered in the gay rights movement and shaped anti-sodomy laws across the country. Beginning in Illinois in 1961, a number of states passed legislation to remove penalties associated with consensual sodomy. Nineteen additional states followed suit through the 1970s. At the same time, anti-sodomy laws remained a criminal offense in other states, and some even revised definitions so the law only applied to same-sex sexual acts. These state-based differences continued until 2003, when the Supreme Court of the United States ruled anti-sodomy laws unconstitutional in the landmark case, *Lawrence v. Texas* (2003). Despite this ruling, numerous states have not repealed their anti-sodomy laws, which reflects and contributes to the ongoing discourse of deviance associated with same-sex, sexual acts.

Medical pathologization

Throughout the twentieth century, the criminalization of queer people was bolstered by the medical field. Medical organizations played a significant role in crafting deviant classifications for queer people and served as mechanisms of surveillance and punishment within and beyond medical institutions. Prominent organizations such as the American Psychological Association (APA) and the World Health Organization (WHO) classified LGBTQIA people as mentally ill and diseased. This pathologization resulted from measuring LGBTQIA identities against a set of norms that were built upon narrow understandings of the human body, sexual orientation, and gender identity.

For example, same-sex and same-gender attraction, have undergone several iterations of being classified as a mental disorder by the Diagnostic and Statistical Manual of Mental Disorders (DSMs). The DSM classified homosexuality as a sociopathic personality disturbance in 1952, a deviation from normal sexual behavior in 1968, and an ego-dystonic disorder in 1973—a classification that was not completely removed until 1987. Similarly, the ninth revision of the International Classification of Diseases and Related Health Problems (ICD-9), developed by the World Health Organization (WHO), listed homosexuality as a mental disorder in 1977, and this designation was not removed until the ICD-10 in 1990.

The DSM and ICD have also contributed to the pathologization of gender identities other than cisgender and of sex traits that fall outside the narrow, subjective criteria for male and female. The DSM currently lists "gender identity disorder" with diagnostic criteria that includes "a strong and persistent cross-gender identification" and "persistent discomfort with his or her sex or sense of inappropriateness in the gender role of that sex." Similarly, the latest revision of the ICD provides "gender incongruence" as a diagnostic category, which is defined as "marked and persistent incongruence between an individual's experienced gender and the assigned sex." With regard to sex traits, the latest versions of the ICD and DSM continue to pathologize intersex individuals as having disorders of sex development (DSD). Such a diagnosis commonly results in high-risk, genitalia-altering surgeries on non-consenting infants and children that can lead to long-term physical and psychological damage (Jordan-Young, 2010).

The unjust classification of LGBTQIA people as diseased has resulted in unnecessary and harmful medical intervention that has perpetuated the stigma of queer people, contributing to what Subini Annamma (2017) has described as a pedagogy of pathologization or the social construction of criminal identities based on deviant labels.

Implications for schools

The legal and medical positioning of queer people as deviant and diseased significantly influenced the treatment of queer people in schools. As a result, several mechanisms were developed to keep queer people and their identities out of education. These included efforts to remove and bar queer educators, as well as school curricula that perpetuated deficit perspectives or ignored queer people entirely.

Queer educators

Throughout the latter half of the 20th century, dominant discourses falsely positioned homosexuality as an ideology that could be indoctrinated, placing vulnerable student populations at risk. As a result, queer educators were perceived as a threat and education policies explicitly denied rights to queer educators or offered little to no employment protections (Blount, 2006; Lugg, 2006). Schools aggressively policed sexual orientation by identifying, removing, and barring queer educators from practice. Although queer educators were the target of such policing, all educators needed to prove their sexual orientation by maintaining social and cultural norms that corresponded with their gender identities (Kissen, 1996; Woods and Harbeck, 1992). For example, heterosexual marriage requirements and evidence of an athletic background served as “tests” intended to root out gay men from administrative roles. Interestingly, lesbians were rarely subjected to the same requirements, as they were not as prominent in popular thought and because women were paid less than men in the same profession (Blount, 2006).

Failure to meet heteronormative standards resulted in the loss of employment, public shame and ridicule, and in some cases criminal prosecution. In many regions across the country, queer educators were fired and sometimes had their professional credentials revoked. When dismissals were challenged at district, local, or state levels, courts often decided against queer educators on the grounds that educators were expected to serve as moral exemplars for students, and being queer violated notions of morality (Graves, 2009). State legislation also supported legal forms of discrimination. Some states attempted to pass laws that forbade the employment of lesbian and gay educators, while nearly half of US state statutes legally allowed employment discrimination on the basis of sexual orientation and gender identity (Graves, 2009).

School curricula

Negative beliefs about queer people as deviant and diseased also lead to their exclusion from school curricula. Throughout the latter half of the 20th century, materials with references to queer topics, figures, accomplishments and historical events rarely occurred (Lipkin, 1999). The few states and school districts that pursued LGBTQIA-related materials were often met with resistance from school boards, community members, policymakers, and educators (Biegel, 2010; Lipkin, 1999). One exception was the Massachusetts’ Safe Schools Program established in 1993 in the wake of increased suicides and other risk factors for queer youth (Lipkin, 1999).

Efforts to erase and stigmatize queer experiences and identities from school curricula were especially fervent in relation to sex education. During the early 1900’s, concerns about adolescent sexuality led to two divergent views, one that supported sex education as a way to bring attention to a so-called sexual crisis, and a second that feared sex education would contribute to immoral activity (Moran, 2009). Both viewpoints equated sexuality with heterosexuality. Exceptions existed but in ways that warned adolescents, particularly boys, about gay men being sexual predators. Efforts to include positive depictions of gay and lesbian people in sex education increased somewhat in the 1970s, coinciding with the gay rights movement and the APA’s removal of homosexuality as a mental illness from the DSM; however, these reforms gained little traction. In the 1980s queer inclusion in sex education became synonymous with HIV/AIDS education (Moran, 2009), further reinforcing negative beliefs about queer people as diseased and deviant.

By the end of the twentieth century, most sex education programs continued to portray heterosexuality and cisgender bodies as normative and advocated for abstinence only until marriage. Even schools with comprehensive sex education programs, which included information on contraception, continued to discourage sexual activity and stigmatized queer people by linking them to HIV/AIDS instruction (Kendall, 2012).

Conclusion

The legal criminalization and medical pathologization of LGBTQIA people reflected and reproduced heteronormative and cisnormative societal beliefs. The effects on LGBTQIA people have been dire, legitimizing a discourse of deviance and disease that pervades our organizations and institutions. As a result, policies and practices systemically work to perpetuate discrimination against LGBTQIA people, denying them the same agency and access to the same benefits as heterosexual and cisgender people. As a microcosm of culture and society, our educational systems have similarly contributed to this discrimination, resulting in the near absolute erasure of LGBTQIA individuals from our schools for most of US history. LGBTQIA educators and students alike have been forced into the “closet,” forced to deny their identities, experiences, and families or risk certain harassment, unemployment, and discrimination. This struggle for visibility is one that continues in the 21st century.

Increased visibility and protections for LGBTQIA people

The turn of the 21st century marked a time of increased negotiations between society at large and LGBTQIA activists who increasingly demanded equal rights in all aspects of public life. Following the civil rights protests of the 1960s and the AIDS crisis of the 1980s, America seemed to develop greater empathy for LGBTQIA individuals. Beginning in the 1990s, positive public visibility of LGBTQIA people increased and, in the 2000s, numerous rulings provided vital legal protections. At the same time, this steady advancement has been tempered by backlash and persistent bias. In this section, we discuss these influential societal shifts and the impact they have had on queer people in schools.

Positive, public visibility

The 1990s marked the beginning of a gradual shift in the national dialog about sexual orientation in the United States. Long-standing narratives that marked homosexuality as immoral and deviant were countered by increased positive public representations of gay and lesbian people. Attention to gender and positive representations of transgender people followed.

Mainstream media played a key role in shifting public beliefs about gay and lesbian people. Many of these efforts focused on normalization. Popular television series such as *Roseanne* and *Friends* broadcast episodes with positive portrayals of gay characters and topics (see: *Roseanne*, “Don’t Ask, Don’t Tell,” 1994 and *Friends*, “The One With the Lesbian Wedding,” 1995). In 1997, lead character Ellen DeGeneres of *Ellen* came out to an audience of 42 million viewers, a performance that earned her a Peabody award (see “The Puppy Episode”). Gradually, television programs featured gay lead characters in shows like *Will and Grace* (1998), *Queer as Folk* (2000), and *The L Word* (2000). In 2009, *Modern Family* featured two dads raising their daughter, a move that helped to normalize same-sex families as being like any other family.

Gradually, terms like gay, lesbian, and queer became part of the mainstream lexicon and opinion polls indicated increased acceptance of gays and lesbians. Despite positive advancements, public backlash was also on display. Homophobic hate crimes continued and anti-gay groups worked to intimidate and undermine LGBTQIA advocacy efforts. One example of anti-gay organizing is the Westboro Baptist Church (WBC), which is categorized as a hate group by the Southern Poverty Law Center (SPLC). In 1991, the Westboro Baptist Church (WBC) organized its first picketing ministry—protests designed to raise awareness of the church’s beliefs. The group gained notoriety in 1998 when members protested the funeral of Matthew Shepard, a gay college student brutally murdered in an anti-gay hate crime. WBC protesters target businesses and individuals that are perceived as supporting LGBTQIA rights and they commonly carry signs proclaiming, “God Hates Fags” and “Thank God for AIDS.” The WBC claims to have held 40,000 protests (SPLC, n.d.).

Although increased public visibility of LGBTQIA people has been viewed as a positive advancement, some queer activists have raised concerns that queer people’s acceptance is often conditional, granted only when queer people conform to dominant ideologies around gender, sex, or sexual orientation. The idea that marginalized peoples’ acceptance is contingent upon their compliance with mainstream society’s expectations is referred to as *respectability politics* (Higginbotham, 1993). *Respectable queerness* follows the same logic in which acquiring a respectable social identity means performing in ways that replicate heteronormativity and cisnormativity, such as assimilating to heterosexual constructions of domesticity (e.g., marriage, monogamy, procreation) or adhering to binary gender norms (Joshi, 2012). This creates a hierarchical system of privilege that illustrates respectable people as all-American, White, privately affectionate, and family oriented (Ho, 2019). Those who fail to meet respectability criteria are rendered voiceless, powerless, and invisible (Cohen, 1999; Ho, 2019; Story, 2016). Thus, advancements in LGBTQIA visibility have not extended equally to all queer people.

Expanded legal protections

The 2000s also marked a time of expanded legal protections for LGBTQIA people. Legal decisions focused primarily on whether to include LGBTQIA people in laws and policies that already protected cisgender and heterosexual people. One such decision was *Lawrence v. Texas* (2003), which eliminated sodomy laws and extended constitutional protections for privacy and consensual intimate contact to individuals regardless of sex, gender, and sexual orientation. Around the same time, some states expanded statutes to protect individuals based on gender identity and sexual orientation in policies that include housing, employment, and biased-motivated crimes. Laws around marriage and domestic partnership also changed.

Many of the new protections resulted from federal legal rulings. In *United States v. Windsor* (2013) the Supreme Court struck down the Defense of Marriage Act’s definition of marriage as being between a man and a woman. In *Obergefell v. Hodges* (2015), the court ruled that all states must recognize marriages between same-sex couples. It is important to note that the decision in *Obergefell* was largely justified by an emphasis on the importance of children being raised in family units with two parents, and thus, the *Obergefell* case hinged on respectability politics. In contrast, *Bostock v. Clayton County* (2020) helped to broaden legal protections beyond cisnormative and heteronormative beliefs. The *Bostock* ruling granted employment protections to LGBTQIA people under Title VII of the Civil Rights Act of 1964, which prohibits discrimination based on sex. Previously, Title VII had been used to advance equal opportunities for women, conflating “woman,” a gender category, with “sex.” Successful application of Title VII in the *Bostock* ruling expanded sex-based discrimination to include discrimination against LGBTQIA people whose identities are socially constructed in relationship to medico-legal definitions of sex.

Efforts to expand legal protections throughout the 2000s have not always been successful and some protections have been undermined. For example, almost half of all US states include broad statutory religious exemption laws, making religious organizations exempt from laws that conflict with their doctrines or beliefs. Some states specifically allow organizations with religious affiliations to deny services such as healthcare or adoption to LGBTQIA people. Supreme Court rulings have similarly threatened the rights of LGBTQIA people to access the same services as heterosexual and cisgender people. In *Masterpiece Cakeshop Ltd. v. Colorado Civil Rights Commission* (2018), in a 7-2 decision, the Supreme Court ruled in favor of a business owner who refused to create a cake for a same-sex wedding celebration. The 2022 Supreme Court decision to overturn *Roe v. Wade*, which protected the constitutional right to an abortion, was accompanied by calls for the court to reexamine other decisions on topics not explicitly addressed in the constitution. This includes the 2015 *Obergefell v. Hodges* decision, which argued for marriage as a fundamental right and liberty that extends to same-sex marriage. These legal machinations demonstrate the precarity of LGBTQIA rights.

More generally, it is important to note that advancements in visibility and legal protections have not been experienced evenly across all LGBTQIA people. Activism aimed at normalizing gay people often occurred at the expense of gender expansive and transgender people. Intersex people remain largely invisible and nonbinary people continue to fight for sex/gender markers that adequately convey their identities and experiences.

Implications for schools

The experiences of LGBTQIA people in schools at the turn of the 21st century parallel many of the developments in larger society. As public visibility and legal rights increased, so did the visibility of LGBTQIA students and educators and the calls for protection and inclusion. These efforts have been integral in developing safe and representative spaces for queer people. In many cases, they have also been met with pushback, revealing gaps in policy and practice that fail to include and affirm queer people in PreK-12 education.

Queer educators

Many scholars have documented the benefits of having openly queer educators in schools. Research from GLSEN (formerly the Gay, Lesbian and Straight Education Network) substantiates multiple positive benefits for students and overall climate (Kosciw et al., 2018). Out and visible queer educators help affirm the sexual orientation and/or gender identity of LGBTQIA students. Queer students tend to feel safer when an out adult works in their school and advocates for equity and social justice. Out teachers lead to decreased instances of student harassment and violence based on sexual orientation and gender identity. Despite these benefits, lack of adequate supports can inhibit educators from being out and visible.

By the 21st century, protections for queer educators varied considerably. A 2015 report documented inconsistencies across state policies, namely, that nearly half of US states did not include sexual orientation or gender identity in employment non-discrimination statutes (Wright and Smith, 2015). The report also used survey data from LGBT educators to document differential experiences across contexts and found that the extent to which schools protected, affirmed, and included queer identities created significant differences in school climate. In schools where policies existed for reporting harassment, professional development addressed queer identities, and curricula and resources were queer-inclusive, LGBT educators were less likely to fear and experience backlash about their sexual and/or gender identities. Differences in protections across the United States persisted until 2020 when the Supreme Court ruling in *Bostock v. Clayton County* (2020) granted employment protections to LGBTQIA people.

Although increased protections exist, coming out as a queer educator presents several challenges. Histories of and experiences with discrimination and oppression may instill feelings of fear and rejection. Many queer educators continue to worry about employment retaliation—either as it relates to job security or confronting harassment and instances of violence from colleagues, students, families, and community members. These risks are further amplified for queer educators who belong to and/or work in regional and cultural communities in which greater shame and stigma are associated with being queer (Brockenbrough, 2018; Cooper, 2016; Tooms, 2007). As a result, many queer educators remain closeted to some extent—either by not disclosing or making careful decisions about what to disclose to whom. Educators who remain closeted often engage in nondisclosure strategies, such as avoiding conversations about relationships or performing their gender in ways to appear non-queer. These strategies require having “dual identities,” where they are out in their private life but closeted as professionals (Cooper, 2016). This approach can jeopardize educators’ sense of authenticity, particularly when teaching and serving as role models for youth.

Queer students

The end of the twentieth century also saw growing efforts to create safe spaces in schools for gay and lesbian students (Griffin and Ouellett, 2003). The impetus came, in part, from a burgeoning body of research aimed at documenting the overall wellbeing of queer youth. In 1989, the U.S. Department of Health and Human Services released a report showing that gay and lesbian youth were three times more likely to die by suicide than heterosexual youth (Remafedi, 1994). Additional studies indicated that gay and lesbian youth experienced higher rates of victimization from peers in school settings (D’Augelli and Dark, 1994). In 1999, GLSEN released their first school climate survey, which exposed the depth of bullying directed at queer students, which included verbal harassment, physical assault, and sexual assault with limited intervention from faculty or staff (Kosciw and Cullen, 2002).

In response to these data, 21st century queer rights activists and their allies have fought for national attention, inciting calls to action and demanding safer school environments (Martin and Strom, 2019). One approach has been to lobby for state- and district-level anti-bullying policies. In 2011, 46 states had anti-bullying statutes but only a quarter of states had statutes with protections for sexual orientation and gender identity or expression (Stuart-Cassel et al., 2011). By 2019 all US states had adopted anti-bullying laws (U.S. Department of Health and Human Services, 2018); however, policies alone may be insufficient (Lugg and Murphy, 2017). For example, an examination of district-level data shows that only 1 in 10 school districts had anti-bullying policies that explicitly protected LGBT students (Kull et al., 2015).

Another approach has focused on addressing the systemic marginalization of LGBTQIA youth in schools through school-sponsored organizations (Mayo, 2004; Payne and Smith, 2013; Sadowski, 2016). Some schools developed student-led Gay-Straight Alliances or Gender and Sexuality Alliances (GSAs) as a way to create safe spaces for queer youth and their allies to meet, discuss interests, and receive support (Macgillivray, 2007). Research shows that students in schools with GSAs encounter fewer instances of bullying, harassment, and violence than students in schools without GSAs (Kosciw et al., 2018; Toomey et al., 2011). At the same time, GSAs have been critiqued as being composed predominantly of White queer youth or White allies (McCreedy, 2010; Pascoe, 2007). The presence of GSAs in schools has also been the source of considerable pushback and even legal

action. Detractors have argued, for example, that GSAs make school personnel feel uncomfortable (*Vanguard High School Gay-Straight Alliance v. Yancey et al.*) and, in the case of *Gonzalez v. School Board of Okeechobee County*, that a GSA would be incompatible with abstinence-only policies (American Civil Liberties Union, 2015). Ultimately, the courts have consistently ruled in favor of GSAs, holding that the 1984 Federal Equal Access Act guarantees students in secondary public schools the right to form GSAs.

In recent decades, advocates have also called for increased LGBTQIA visibility in school curricula. LGBTQIA curricular inclusion is linked to perceptions of and experiences with school safety (O'Shaughnessy et al., 2004; Russell et al., 2006). Queer students who learn in environments with less inclusive curricula are more likely to be victimized and harassed based on their sexual orientation and gender identity (Kosciw et al., 2018). They are also more likely to consider not graduating from high school (Palmer et al., 2016). California became the first state to mandate a more LGBTQIA-inclusive curriculum through the 2011 FAIR Education Act; however, by 2020, only three other states (New Jersey, Illinois, and Colorado) had followed suit and six states continued to deny more inclusive curricula through "No Promo Homo" laws that ban teaching about "homosexuality" as an "acceptable life-style" (Murphy and Lugg, 2016). Thus, few PreK-12 schools in the United States include LGBTQIA topics in curriculum and those instances are generally confined to sexual education classes, and to a lesser extent in language arts and history (Kosciw et al., 2018). Unfortunately, much of the curriculum and related texts have perpetuated deficit perspectives, such as stigmas around HIV/AIDS for gay men (Fields, 2008; Kendall, 2012; Snapp et al., 2015). Furthermore, inclusion rarely moves beyond treating sex, gender, and sexual orientation as rigid binaries and typologies (Kendall, 2012), which can have detrimental academic, social, and emotional effects on queer students (Kosciw et al., 2018).

Despite clear, consistent, and widespread research that justifies LGBTQIA inclusion in schools, queer visibility remains elusive. Education scholar Elizabeth J. Meyer (2015) suggests three reasons why schools have been slow to implement LGBTQIA policy and practice: (1) resistance stemming from the religious right; (2) fears that inclusion would lead to discussions of sexual behavior; and, (3) a lack of courage among practitioners, politicians, and professional organizations. Some scholars have also suggested that implementation of LGBTQIA policy and practice in PreK-12 schools may stem from the absence of LGBTQIA topics in training programs for teachers and school leaders (Jennings, 2012; Leland, 2020; Murray, 2014; Payne and Smith, 2018). As such, real improvements in school safety for LGBTQIA students have not kept pace with the need or with growing societal acceptance.

Conclusion

Some progress has occurred throughout the 20th and 21st centuries in terms of inclusion and visibility, more often, in broader social and political contexts than in schooling and education. Public visibility through media representations helped to shift mainstream beliefs about queer people. Major Supreme Court rulings found sodomy laws unconstitutional, granted equal marriage rights regardless of sex, and increased employment protections on the basis of sexual orientation and gender identity. At the same time, heightened backlash, including from the conservative US Supreme Court, appears imminent.

In our schools and educational settings, inclusion and protection have been slow to take shape. Queer educators continue to fear backlash. Policies and practices vary widely in their ability to protect queer students. School curricula continues to erase LGBTQIA people and related topics.

Looking forward: toward a queer affirming future

Existing scholarship on queer students and educators in the United States shows how constructions of sex, gender, and sexual orientation have normalized heterosexuality and cisgender bodies and how educational institutions reinforce these norms to the detriment of LGBTQIA people. Certainly, in the last twenty years there has been an increase in protections and visibility, but significant harmful limitations remain. Improvements to policy and practice have not occurred uniformly across the United States, with rural and suburban areas demonstrating less progress. Changes to policy and practice are often symbolic representations that lack the resources and accountability mechanisms needed to make meaningful improvements. The activism of queer people of color and their contributions to dismantling forms of oppression have been overlooked and underrepresented in accounts of LGBTQIA experiences.

Moving forward, we argue for educational policies and practices that affirm queer people, their identities, and their rights. This work extends from prior efforts to make queer people more visible and school spaces more inclusive. Visibility and inclusion should not be symbolic, or token gestures, nor should they depend on respectability politics. Rather, the advancement of LGBTQIA rights should reflect genuine, critical engagement that is sustained and embedded throughout educational institutions and the policies that drive them. Queer-affirming schools should acknowledge the full spectrum of queer subjectivities and recognize systems of privilege around sex, gender, and sexual orientation. They should challenge norms that privilege heterosexuality and cisgender identities, and disrupt the regulatory policing of sexual orientation, gender expression, and gender identity. Schools should also adopt approaches to inclusion that attend to the range of social and cultural issues that intersect with queer identities. Affirming queer people requires simultaneous efforts to interrogate forms of oppression and marginalization around race, ethnicity, nationality socioeconomic status, ability, and religious beliefs that are likely to exist in school policies and practices.

Moving forward, a queer-affirming future can only be accomplished through the involvement and collaboration of multiple education stakeholders. This includes researchers whose scholarship could expand upon the state of queer visibility and inclusion

in schools; policymakers whose efforts could challenge and rewrite policies that drive educational systems and structures; and practitioners whose instruction and leadership could create more inclusive school climates for queer students and educators. Further, the work of researchers, policymakers, and practitioners should mutually inform each other to help make sense of existing knowledge and practice, but also to pursue underexplored areas and find potential solutions to problems. By engaging in these critical conversations, we will gain a richer, deeper, and more accurate picture of the landscape of schooling and education for queer students and educators.

Multilingualism at school

Multilingualism can be defined as “the ability of societies, institutions, groups and individuals to engage, on a regular basis, with more than one language in their day-to-day lives” (European Commission, 2007: 6). Nowadays multilingualism has spread in the educational context because of historical, social, political and economic reasons.

Multilingualism in education takes many forms depending on factors such as linguistic diversity, the aims of the educational program or the characteristics of the languages involved. In many contexts, a great number of schoolchildren have different home languages from the ones used at school. Today, school classes are more linguistically diverse than in the past, particularly in the case of big cities in Europe and North America, due to the mobility of the population. In a globalized world, even young learners come to the classroom with rich and dynamic trajectories that are influencing their language learning process. These students have to learn the language(s) of the host country and other languages in the curriculum, which in many cases are different from the ones spoken at home.

Multilingualism in education is often related to the mobility of the population but it can also be related to the use of two or more languages in the same region. In these contexts, the situation of the languages is often asymmetrical and one language, the majority language, is dominant while the other(s) have a minority status. Students who speak the minority language at home are also in most cases multilingual because the majority language is widely used and it is necessary to learn it.

The position of minority languages in education can range from a strong position of having the minority language as the main language of instruction to a very weak position of making no provision for the minority language in the curriculum. Educational policies on the role of regional minority languages in the curriculum can change over time. For example, the status of minority languages in Spain changed in the last decades of the 20th century. After many years of exclusion, Basque, Catalan and Galician became co-official languages in their regions in the late 1970s and early 1980s and were strongly reinforced because of their use in education. Minority languages are defined by their status as compared to the majority language. A minority language such as Catalan with approximately 10 million speakers has a minority status as compared to Spanish in Spain but has more speakers than other European state languages such as Danish, Greek or Swedish. As Gorter (2001) explains, the weak status of a minority language and its use at school may be associated with the limited number of speakers (for example, Navajo in the US or Frisian in the Netherlands), or their limited functions in society even when the demography is strong (for example, Quechua in Peru, Bolivia and Ecuador). The status of the minority language can have an impact on its use in education but other factors such as the linguistic distance between the minority and the majority language can also be important. When the majority and minority languages are typologically related, such as Catalan and Spanish or Frisian and Dutch, it is easier to use the minority language in education because there are fewer comprehension problems. When there is typological distance between the majority and the minority language, such as Māori and English or Basque and Spanish, more effort is needed to use the minority language in education.

Multilingualism in education does not necessary imply multilingual education. Due to the existence of regional minority languages or the mobility of the population, students may have different home languages but this situation does not mean that multilingual competence is necessarily considered a goal in education. Multilingual education can be defined as “the use of two or more languages in education provided that schools aim at multilingualism and multiliteracy” (Cenoz and Gorter, 2015: 2). Therefore, we refer to multilingual education when multilingualism is one of the educational goals in a school, region or state. In this case the educational system makes provisions for teaching languages either as subjects or integrating language and content. This does not necessary mean that the students’ first language(s) (L1) are among the languages to be learned.

Multilingual education can be aimed at speakers of majority or minority languages. Students with the majority language as a first language are sometimes enrolled in educational programs with a minority language as the language of instruction. This is common in some regions such as Wales or the Basque Country where the minority language has become the main language of instruction. These programs are at the same time enrichment programs for students with the minority language as a home language and immersion programs for speakers of the majority language as home language.

Apart from minority and majority languages, nowadays multilingual education in different parts of the world is characterized by the presence of English in the curriculum. This is the case not only when English is the majority language in countries such as the UK, the US, Canada, Australia or New Zealand but also in countries where English is a second or foreign language. English is taught as a subject in schools in most countries in the world and it is increasingly used as a language of instruction at all levels of education. English is more important in the curriculum than any other foreign language in the past. English is introduced earlier and it is often used as an additional language of instruction.

Sometimes the term “bilingual education” is used when there are two languages in the curriculum and multilingual education when there are more than two languages. Bilingual programs involving minority languages in non-English speaking countries have moved from bilingual to multilingual education because English has been added to the curriculum from an early age (Gorter et al., 2014a,b). Nowadays, educational policies including minority languages often include three languages which are English, the majority language and the minority language, except in cases where English is the majority language as in Welsh or Māori schools. Some examples of this situation include: Frisian, Dutch and English in Friesland, the Netherlands (Gorter, 2005); Basque, Spanish and English in the Basque Country, Spain (Cenoz, 2009) or Mongolian, Chinese and English in the Inner Mongolian Autonomous Region of China (Yi and Adamson, 2019).

Multilingual education aims at multilingualism for students who speak different home languages and learn additional languages at school. Globalization, the mobility of the population or the protection of minority languages are important factors for the development of multilingual education. Multilingual education is inclusive education that acknowledges and promotes linguistic diversity.

Schools that aim at multilingualism can be found in different parts of the world and involve different types of languages, different pedagogies and sociolinguistic contexts. This situation creates the need for new approaches that can deal with the diversity of students and the increasing role of languages in the school curriculum.

Types of bilingual and multilingual education

As it has been said, the distinction between bilingual and multilingual education usually refers to the number of languages in the curriculum but the term “multilingual education” is sometimes used as a generic term.

There are ways in which the different types of bilingual and multilingual education can be analyzed. Baker and Wright (2017) refer to bilingual education and distinguish strong and weak forms of bilingual education according to the language background of the child, the language of the classroom, and the linguistic, societal and educational aims. Weak forms of bilingual education do not have bilingualism as their aim and are submersion, segregationist, transitional, mainstream and separatist. Strong forms of bilingual education foster bilingualism and are immersion, maintenance and heritage language bilingual education, dual language bilingual education and bilingual education in majority languages. The typology is very comprehensive and most educational systems could be included in one or more of these categories but as Baker and Wright (2017: 193) acknowledge “there are multitudinous sub-varieties” and “not-all real-life examples will fit easily into de classification”.

The number of types and sub-varieties can entail a substantial increase when three or more languages are considered. Cenoz (2009) proposed a different perspective to describe, compare and evaluate different types of multilingual education in the *Continua of Multilingual Education*. This model represents the features of multilingual education as continua rather than in closed categories and looks at linguistic, sociolinguistic and educational factors. The idea is that when two or more multilingual programs are compared along these three dimensions they are represented in different positions along continua.

When analyzing the characteristics of multilingual programs using the *Continua*, the linguistic factor is language distance and the ends of this continuum are “more distant versus less distant”. Linguistic distance is relative and the home languages and the languages in the curriculum can be related to each other to different degrees not only because of origin but also because of contact. Linguistic distance can influence the design of the different programs and the need to devote more or fewer hours to the different languages either as subjects or as languages of instruction. It can also have some influence on the degree of multilingualism of the teachers. For example, French is closer to English than to Japanese but there are also words that French and Japanese or English and Japanese share. Linguistic distance is important when examining multilingual education because languages that are closer share more aspects of their syntactic structure, discourse, phonology or lexis and may be easier to learn.

At the sociolinguistic level, the variables to consider are the use of the languages by students at home and in their social networks, the number of speakers of the different languages in the community, the status of the language, their use in the media or in the linguistic landscape outside school. Different programs can be represented as “more or less multilingual” along the continua for these dimensions. Multilingual programs are more multilingual when students use more languages and when the schools are located in a context that is more linguistically diverse.

The educational variables that can indicate if a program is more or less multilingual are: subject, language of instruction, teacher and school context. The multilingual programs being compared can be represented as “*more or less multilingual*” along the continua for these dimensions. ‘Subject’ refers to the use of different languages as school subjects and the intensity and grades in which the languages are taught. ‘Language of instruction’ considers the teaching of content subjects through different languages. ‘Teacher’ looks at the multilingual profile of the teachers and their specific training in multilingual education. ‘School context’ refers to the diversity of languages used among teachers, with supporting staff, with parents or in the linguistic landscape of the school (see Cenoz and Gorter, 2019). The continua of multilingual education model highlights the interaction of linguistic, sociolinguistic and educational variables.

The *Continua of Multilingual Education* is a tool to compare different multilingual education programs but could also be used for comparing the degree of multilingualism in the linguistic, sociolinguistic and educational dimensions at two points in time so as to see progress in multilingual education. The use of continua to compare different multilingual programs is a dynamic approach without fixed categories and uses open categories allowing a wider diversity of situations, particularly when three or more languages are involved.

Traditional trends in multilingual education

Even if multilingual education aims at developing competences in several languages the traditional approach has been to focus on one language at a time and to separate languages at school. Some teachers who are multilingual are told or decide themselves to pretend they are monolingual so as to use only the target language. Some schools have tried to have a designated classroom to teach only one language and have posters and charts on the walls only in one language. In some English classes students even use English names instead of their real names. Pedagogical practices have been based on isolating languages by using only the target language and avoiding translation or any use of the first language(s). These traditional policies are associated with monolingual ideologies and the idea that the best way to develop multilingualism is through monolingualism. The monolingual native speaker is seen as the ideal goal to be achieved and learners are seen as inferior to the native speaker because even if they make progress in most cases they will still be different from native speakers of the target language.

Traditional monolingual views are widely spread in multilingual education. Using only the target language in class has been justified as a way to avoid interference from other languages and also because this policy of separation can provide more exposure to the target language and opportunities to use it. There is also the idea that both teachers and students have to work harder if only the target language is used in the classroom. However, monolingual ideologies and policies of language separation have also been criticized (Cummins, 2017). One criticism is the idea is that multilingual speakers are different from monolinguals and should not be considered deficient when compared to monolingual speakers because their language competence should not be evaluated using monolingual standards (Cook, 2013). Moreover, multilingual speakers have more resources at their disposal and they can use elements only from one language or from two or more languages depending on the communicative context and the linguistic skills of their interlocutors.

New trends in multilingual education

In the last years there have been theoretical and pedagogical proposals that go against the strict separation of languages in multilingual education and the reference to the ideal monolingual speaker (Cummins, 2017; Cenoz and Gorter, 2020). These ideas can be summarized with reference to the model “Focus on Multilingualism” which considers three dimensions: the multilingual speaker, the multilingual repertoire and the social context (Cenoz and Gorter, 2014).

The multilingual speaker. As we have seen, multilingual speakers are different from monolingual speakers. The idea is that multilingual speakers cannot be considered “*failed native speakers*” because they often are “*highly skilled communicators who make use of their multilingual resources*” (Jenkins et al., 2011: 284). In fact, multilingual speakers can communicate more effectively in more situations and with a larger number of interlocutors. An important characteristic of multilingual speakers is that their linguistic trajectories are richer and more dynamic than those of monolingual speakers. Quite often as the result of mobility or being speakers of minority languages, multilingual speakers have experienced many different linguistic situations that have shaped the way they communicate (see also Canagarajah, 2018).

Moreover, multilingual speakers navigate between languages and their discourse practices are different from those of monolinguals because of the resources they can use (Mauranen, 2018). The type of competence a multilingual speaker has in one language is difficult to isolate from the other languages because all the languages are intertwined. Multilingual speakers’ competence is fluid because there are no hard boundaries between languages. Multilingual competence is also dynamic because it can change over time according to the multilingual speaker’s experience with the different languages. An important point related to the characteristics of multilingual speakers is that their competence is different and the monolingual perspective of achieving perfect knowledge in each of the languages is not only unreachable but unfair (Grosjean, 2010). Multilingual ideologies consider that multilingual speakers are not the sum of several monolingual speakers because they have a different type of competence that cannot be compared to that of monolinguals (Cenoz and Gorter, 2020).

The whole multilingual repertoire. The whole multilingual repertoire refers to the multilingual speaker's linguistic knowledge related to all the languages s/he has experience with (see also [Hall, 2019](#)). According to [Cenoz and Gorter \(2014, 2015\)](#), multilingual speakers can be more effective learners and users of a target language if they are allowed to use resources from their whole linguistic repertoire. Multilingual speakers have a rich repertoire that includes not only linguistic elements such as vocabulary or syntactic rules but also their whole trajectories as language learners and language users.

The whole multilingual repertoire can be regarded as prior knowledge based on previous experience and the use of this knowledge is crucial for learning ([Bransford et al., 2000](#)). In the case of multilingualism, languages support one another at the cognitive level. Research on third language acquisition shows that bilinguals have advantages when learning additional languages because of their enhanced metalinguistic awareness and their expanded linguistic repertoire ([Cenoz, 2013](#); [Jessner and Cenoz, 2019](#)). [Cummins and Persad \(2014\)](#) highlight the importance of integrating new input into existing cognitive structures in the case of students with diverse linguistic backgrounds because previous knowledge is the foundation for interpreting new information. Monolingual ideologies and practices prevent students from using the resources they already built over the years as a result of their multilingualism. New trends in multilingual education such as Focus on Multilingualism propose the activation of the whole linguistic repertoire because it can be a rich resource for learning. In fact multilingual learners can develop metalinguistic awareness by comparing elements of their different languages they know at different levels (phonetic, lexical, morphosyntactic, pragmatic, discursive) and use their resources cross-linguistically.

The social context. Multilingual speakers use the resources in their multilingual repertoire in different ways depending on the social context. The teaching and learning of languages needs to take into account the characteristics of the social context and the communicative needs students have. It is not the same to learn a language that is needed for many purposes in everyday life or a language that is only needed to read occasionally some reports. At the same time, it is important to consider that multilingual speakers have their own communities of practice and that students can use elements from different languages in a natural communicative way, provided that these elements are understood by their interlocutors. Multilingual pedagogies imply that the languages in the students' multilingual repertoire and other languages in society are taken into account without establishing hard boundaries between languages. The social context also implies that students develop their language awareness about the values and roles of different languages in their community and in other contexts.

Focus on Multilingualism "proposes soft boundaries between languages and relates the way multilingual students use their communicative resources in spontaneous conversation to the way languages are learned and taught at school" ([Cenoz and Gorter, 2015](#): 8). The idea is to consider the learner as a multilingual speaker who is allowed to use resources in the multilingual repertoire in different ways depending on the characteristics of the social context. The idea is to activate students' multilingual resources so that they can benefit more from multilingualism.

The Council of Europe proposed the Common European Framework of Reference (CEFR) in 2001 and already then considered that the aim is not to take the languages in isolation and to have the ideal native speaker as a model. A recent development that softens boundaries between languages can be found in the Common European Framework of Reference Companion (2018). This volume includes descriptors of plurilingual and pluricultural competence. These descriptors may not be completely ready to be used in different contexts yet but imply an important step toward considering the whole multilingual repertoire. An example of a B2 level descriptor for "Building on plurilingual repertoire" is the following ([Council of Europe, 2018](#): 162):

Can make use of different languages in his/her plurilingual repertoire during collaborative interaction, in order to clarify the nature of a task, the main steps, the decisions to be taken, the outcomes expected.

As it can be seen using more than one language in the same interaction is accepted in this descriptor.

A multilingual perspective in education goes against long-lasting traditions of language separation and monolingual ideologies and practices. As [Kramsch \(2012\)](#) says they can be considered revolutionary because they challenge the foundation of theoretical and applied linguistics and language teaching.

Translanguaging

The concept most widely used when describing new trends that reflect the shift from monolingual to multilingual ideologies in education is translanguaging. The origin of translanguaging can be found in bilingual education in Wales where Welsh and English are the languages of instruction. It refers to the pedagogical practice of alternating the languages used for input and output in a systematic way ([Lewis et al., 2012](#)). For example, students read a text in English and write a summary or discuss the text orally in Welsh. The idea is that translanguaging requires a deeper understanding because the languages reinforce each other when both are used.

The concept of translanguaging has extended beyond the specific pedagogical practices of alternating the languages used for input and output. [García \(2009: 45\)](#) defines translanguaging as "multiple discursive practices in which bilinguals engage in order to make sense of their bilingual worlds". According to this definition translanguaging refers to spontaneous practices in communication

that have not been designed as a teaching strategy and that could take place inside or outside the classroom. Cenoz and Gorter (2021) explain that translanguaging is an umbrella term that embraces different theoretical and pedagogical approaches. They are different perspectives but they all go against monolingual ideologies of language separation (Canagarajah, 2011; García and Li, 2014).

In some educational contexts translanguaging can be beneficial for speakers of minority languages because it can empower students if they are allowed to use the discursive practices they use for communication outside the school (Otheguy et al., 2015). However, in some contexts translanguaging can be felt as a threat for the use of minority languages. Jones and Lewis (2014) explain that in the Welsh context, translanguaging can also pose a risk in the case of minority languages because it may trigger the use of the majority language. In a study on teachers' beliefs and attitudes, Arocena, Cenoz and Gorter (2015) confirmed that some teachers in the Basque Country thought that translanguaging could weaken the position of Basque, the minority language. Cenoz and Gorter (2017) explain that in some contexts translanguaging could potentially empower majority language students and that is necessary to allocate specific spaces for using the minority language.

Translanguaging in this context, where everybody is proficient in Spanish and only one-third of the population is proficient in Basque, can be seen as a threat for Basque. It is not a threat for Spanish because it is the powerful language and the influence goes from the majority to the minority language. In fact, in this asymmetrical relation, students can use Spanish with very limited traces of Basque but because of the strength of Spanish in the social context, when they speak Basque they tend to use many elements from Spanish. When this is the case translanguaging does not empower speakers of the minority language because their language could disappear in the near future. Translanguaging practices can also be positive in the context of minority languages but it is necessary to develop strategies to maintain and develop minority languages (Cenoz and Gorter, 2017).

Pedagogical translanguaging

In the previous section we have seen that there are different perspectives when discussing the concept of translanguaging because of the complex and diverse contexts of multilingual education. However, in all cases translanguaging implies that the students' linguistic repertoire is an asset and that languages should not be taught as separate entities.

Pedagogical translanguaging implies softening the hard boundaries that have been traditionally built between languages in school contexts. Pedagogical translanguaging is planned by the teacher and can refer to the alternation of language in the input and the output but also includes other planned strategies based on the use of the students' multilingual repertoire as a resource (Cenoz and Gorter, 2021). Pedagogical translanguaging is different from spontaneous translanguaging which is not planned but occurs naturally among multilinguals in context where boundaries between languages are fluid. Multilingual speakers translanguage spontaneously in some contexts but they are not always fully aware of the resources they have as multilinguals and how they can use them to learn languages and academic content. Pedagogical translanguaging aims at developing metalinguistic awareness so that students become aware of their own linguistic resources and use languages more efficiently. Pedagogical translanguaging can be used to develop vocabulary, grammar, pragmatics, pronunciation or discourse.

In the case of vocabulary, by working across languages students can get awareness of their prior knowledge so as to compare cognates, derivatives or compounds in different languages. For example, in a project conducted in the Basque Country, primary school students took pictures of shops in their town and were asked to compare the elements in words like of "bookstore" in three languages (Basque, Spanish and English) so as to see how in some cases languages that are not typologically related such as Basque and English can share the same structure: liburu + denda in Basque, book + store in English. The results of this study indicate that pedagogical translanguaging can have a positive influence on vocabulary development (Leonet et al., 2020; see also Lyster et al., 2013). Pedagogical translanguaging practices to develop vocabulary are not limited to the languages of the curriculum and other home languages can also be brought to the classroom. Some studies have shown how the activation of cognates, that is words that are close in meaning, spelling and pronunciation, can also be very positive (Arteagoitia and Howard, 2015; Simpson Baird et al., 2016; Cenoz et al., 2021).

It may be more challenging to use resources from the multilingual repertoire when languages are linguistically distant but pedagogical translanguaging is not limited to vocabulary development and can be applied to pragmatic and discourse competence. For example, the structure of a letter or an argumentative text can be compared across languages so that students develop metalinguistic awareness and use their multilingual resources to the full extent.

Pedagogical translanguaging implies different teaching strategies and practices and the use of different languages in the same class. It goes against the strong tradition of language separation. It considers students as multilingual speakers who can use their resources to understand more deeply how languages are used and to make links between prior knowledge and new knowledge.

Conclusions

School populations tend to have greater linguistic diversity now than in the past years and at the same time in some contexts one of the aims of education is the development of multilingualism. These trends are related to the mobility of the population, the recognition of some minority languages and the spread of English as the main language of international communication. However there are still many challenges that multilingualism in school contexts faces. One is the different status of the languages. Multilingualism

in international languages is highly prestigious but multilingual schoolchildren who speak other languages are seen as a problem. In some contexts the idea is to forget about those other languages and to adopt a monolingual perspective that does not recognize schoolchildren as multilingual. The recognition of linguistic diversity and multilingual students' linguistic trajectories through multilingual education is a priority in education. It is also a priority to promote multilingual education that incorporates minority languages. Multilingual education goes beyond language classes because it encourages education that contribute to social justice.

In this article we have seen that it is possible to adopt a "Focus on multilingualism" that recognizes students as multilingual who have a multilingual repertoire that can be used in class. In this way multilingual speakers can have more resources at their disposal because they link their prior knowledge even in languages that are not in the curriculum to new languages and academic content.

Traditional approaches are being replaced by multilingual practices such as pedagogical translanguaging that can help learners to activate their own resources by softening language boundaries. The use of linguistic resources from different languages can develop metalinguistic awareness and a deeper understanding of the way languages work. Pedagogical translanguaging has a great potential not only to enhance the acquisition of different languages but also to support learning content.

Introduction

Literacy and language have long been implicated in oppression, privilege and the functioning of democracy. Take, for example, the following line from an English teachers' handbook produced in Victorian England, which suggested that the study of English would "promote sympathy and fellow feeling among all classes" (cited in [Eagleton, 1983](#), p. 20). Eagleton suggests that these efforts were ideological, in that they sought to impart a respect for middle-class values and achievements, to avert political action by working-classes, by building solidarity with middle-classes. The proscribed reading of texts which promote the interests of ruling classes has been problematized by those who instead to view education as a site for social justice. Educators continue to question taken-for-granted rhetoric and assumptions around literacy and schooling and, at the classroom level, many teachers focus on issues of justice and fairness through pedagogies which incorporate critical literacies – studies of textual practices which question the relations of language and power.

Social justice in schools: teachers as researchers

In this entry, we examine a range of practices that educators have designed and enacted as they work toward everyday justice goals in schools. We recognize that some of the most important work undertaken remains invisible to those beyond the classroom or local community, because it is not necessarily the subject of research or publication. We explore a selection of international studies where teacher-researchers have published, or worked alongside an academic collaborator to publish accounts of such practice. We highlight work from across different stages of schooling and from different places to examine what was attempted and why, and what was accomplished.

In mapping the terrain, we begin with an introduction to teacher-research, most notably that of Cochran-Smith and Lytle. Drawing on the work of Antonio Gramsci's writing in Italy leading up to World War I, [Cochran-Smith \(1991\)](#) argued some decades ago that action "is everyone's responsibility, and that each individual, no matter how apparently powerless [is] accountable for the role [they] play or fail to play in the larger political struggle" (p. 279). Using Gramsci's words as a call to address issues of social justice, Cochran-Smith inspired a renewed focus in which teachers are called to inquire into their own practice with justice and fairness in mind. This work also draws on the influences of Kurt Lewin's action research, in the 1940s, which encouraged ordinary people to inquire into their everyday lives.

Australian researcher Garth [Boomer \(1985\)](#) contrasted what he called "big R Research" - which he saw as a "postgraduate luxury," with "small-r research" that teachers could undertake in their own classrooms and schools. Rather than seeing issues of justice as something "out there," teacher inquiry entails teachers adopting an inquiry stance ([Cochran-Smith and Lytle, 2001](#)). Cochran-Smith and Lytle argue that teachers should not only see their work as related to high quality teaching and learning, but also understand that teaching must be part of broader movements for social change and justice. Adopting such a stance in the teaching of literacy requires teachers to be curious, to find moments of dissonance, and to explore both big-P and little-p politics with students as a means of addressing social injustice.

We (the authors) have acted as critical friends and co-researchers with teacher-researchers as they grapple with issues such as racial and gender based oppression, and the effects of poverty. Drawing from critical, Frierian, feminist and poststructuralist theoretical perspectives, Australian teacher-researchers in the eighties were among the first to investigate ways of working with theory in classroom curriculum and pedagogy (Comber, 2018; Luke, 2018). Since that time, many activist teacher/researchers and academics have continued to work together using critical literacy approaches to talk back to existing power structures, and to empower disenfranchized communities and students. Here, we note that as authors, we have both lived and worked in Australia, which is predominately an anglophone country, despite the diverse languages spoken by Indigenous peoples prior to and since colonization. Many of the scholars whose works are explored in this entry work in colonized countries, with historical hegemony and dynamics in relation to English language usage. We hope, however, that the tools and discussion in this chapter provide a framework for further problematizing literacy, including the hegemonic use of English in many educational settings. The section that follows provides some examples of writing that has emanated from internationally located research that considers the literate experiences of diverse and often disenfranchized students, and, is active in engaging teachers into the process of inquiry.

Teacher-research: exploring social justice through critical literacy

Vivian Vasquez

A pioneer of critical literacy approaches in early childhood settings in Canada, Vivian Vasquez documented her work with young children about their inquiries into everyday schooling practices which they saw as unfair. Initially influenced by the critical literacy approach of Australian teacher-researcher, Jennifer O'Brien, in fostering children's questions about the gendered nature of textual representations in books designed for young children, Vasquez (2007) developed her own distinctive pedagogical repertoire, which extended beyond texts to wider cultural and institutional practices.

Vasquez defines critical literacy as a curriculum that "arises from the social and political conditions that unfold in communities in which we live" (2007). Challenging notions that young children are not interested or capable of thinking about diversity, justice and power, her work as an activist scholar has shown how critical literacy can be lived in classrooms, so as to embed critical perspectives into conversations with young children as they learn to think about the world around them. In other words, rather than retaining a focus on critical text analysis, she has encouraged educators to engage young children in substantive discussions that allow them to see how they are positioned in everyday practices, and how both language and imagery positions readers in very particular ways. Drawing on the work of Comber et al. (2007), she has promoted critical literacy practices that extend conceptualizations of literate practices, for example by podcasting as a means of encouraging students to conceptualize texts more broadly than books (e.g., Vasquez, 2010).

Vasquez has used this approach of engaging children in substantive conversation about issues of race, class and gender to make power-relations and socio-political systems visible. As she writes, "Students who engage in critical literacy from a young age are likely going to be better able to contribute to a more equitably and socially just world by being better able to make informed decisions regarding such issues as power and control" (2016, p. 4).

Drawing attention to critical literacies as a means of revealing the exercise of power, Vasquez is also known for her work in popular culture and texts. In thinking about how teachers of young children might make use of popular texts in critical literacy lessons and conversations, Vasquez (2016) points out the importance of considering "how [we can] strike a balance between creating spaces or opportunities for childhood popular culture discourses and everyday texts in the classroom and engage children in working critically with these texts while at the same time making sure not to co-opt their interests. (p. 116). By "co-opting," Vasquez is drawing attention to how critical literacy conversations can draw on children's passions, and, create spaces for substantive conversations that have relevance to their lives, without making these texts "any less desirable" by turning them into schoolwork.

In her seminal paper "What Pokemon Can Teach Us about Learning and Literacy" (Vasquez and Smith, 2003), she considers how young children might be engaged in critical literacies that are both powerful and pleasurable. To analyze the usefulness of popular culture texts in early years education, she explains how her young nephew has engaged in the discourses and complex literate practices required to engage with the Pokemon series of texts. In describing these practices and literacies, the paper highlights the investment of time and energy required by teachers to break the code of a popular culture text, so as to be in a position to talk about, and, engage with students' interests.

Marianna Souto-Manning

In part, the nature of acquiring literacy skills has meant that scholarship in the early years of schooling has focused on decoding and coding print media through teaching spelling conventions, sight words, phonics and so on. Building on the work of Freire, Souto-Manning's scholarship offers practical examples of how literacy can be positioned as a tool for redressing injustice, by acknowledging the cultural and social realities of children and their families. Souto-Manning, an American scholar, has based much of her work documents the inquiries of teachers (including her own inquiries), which often reveal the disjunctures between the

home-cultures of students and socially-dominant cultures of school. As she points out in her work, these early schooling experiences are frequently the first time that children are exposed to dominant cultural discourses and practices, although they are typically expected to embody these values and ways of being.

Souto-Manning has worked with teacher-researchers to adopt a “humble stance” that “[blurs] the boundaries between teacher and learner” (Souto-Manning and Mitchell, 2010, p. 272). For instance, one teacher inquiry (Souto-Manning and Mitchell, 2010) documented the reflections of a teacher-researcher who had sought to include the diverse children in her class by talking about the countries Santa might visit at Christmas as a means of introducing discussion of an array of holidays such as Kwanzaa, Hanukkah, and Chinese New Year. However, the teacher’s reflections showed that children’s perspectives were still largely absent, and that by inviting a parent with insider-knowledge to participate in classroom activities, children were able to learn about each other, and the diversity of traditions, stories and practices that exist beyond the dominant social culture in which the school was embedded. Pursuing genuine participation, and building agency among students, families and communities through literacy is a way of working toward both recognitive and representative justice (Fraser, 2008).

Souto-Manning and Yoon (2018)’s work is an example of how justice has been taken up through literacy inquiry, in the early years of schooling. Drawing on Freire’s emancipatory philosophies, the authors produced *Rethinking Early Literacies: Reading and Rewriting Worlds*, in which they argue that early childhood settings are often where minorities are disenfranchised through practices that fail to attend to power relations, with minority families being blamed for failing to attend to school readiness, or to ensure children coming to school having acquired basic literacy skills. Instead, they argue, reading (and literacy) can be particularly alienating in early years settings, when the dominant focus of literacy instruction is on letter and sound recognition. Disrupting typical education discourses that use standardized assessment in a dominant language (typically English), this approach works toward justice by refusing to accept multilingual students as deficit, because of their proficiency in the dominant language. Souto-Manning’s use of Freire as a decolonizing approach illustrates how even very young children can engage in literacy in ways that value their own languages and circumstances.

This approach of inquiring into issues of justice and diversity has been explored in other ways by Souto-Manning, for example in how LGBTQ+ issues are concealed by dominant literacy practices in schools. Her work with elementary teacher Jill Hermann-Wilmarth (2008) contested a video that suggested diverse sexualities were not relevant in elementary schooling. Reflecting on her experiences as a pregnant, lesbian elementary school teacher, Hermann-Wilmarth drew attention to the ways in which gay and lesbian issues can be silenced through dominant heteronormative discourses and practices in schools. Through critical inquiry using a queer theoretical lens, they proposed practical ways that teachers might become more inclusive of all students in their literacy programs. Writing of her early experiences teaching with a child with lesbian parents, Souto-Manning wrote in her journal that, “I don’t really know what to do It is not fair for me to remain silent. I have to speak up, but how?” (p. 269). She ultimately talked with the child’s parents, reflected on possible approaches (such as reading books to her class that had diverse representations of families) as part of her inquiry into her own practice. Seeing herself as a deliberate questioner, she investigated how her silence had been a form of complicity, and used the opportunity to learn from her students and their families. Sharing stories about her own gay uncles, she expanded the selection of texts available in her classroom, and used books that included diverse family representations as conversation starters.

Souto-Manning’s approach of “kidwatching” (2009) encapsulates how teachers can become curious in learning more about their students and communities, with justice in mind. She gives an example of her work with a student, George, who came to her elementary class having been described a “behavior problem” and who was notorious among first-grade teachers. Rather than accepting this view of George, Souto-Manning inquired into her own practice, troubling the notion of African-American Vernacular English as problematic form of communication in the classroom, and instead seeing how teachers’ insistence on Standard American English created a situation in which teachers and peers chastised and corrected George each time he spoke, leading to frustration, and ultimately, his exclusion from class, and from learning. Through inquiring into her practice (and that of her colleagues), Souto-Manning came to realize that linguistic patterns in Standard American English such as asking rhetorical questions such as, “would you like to sit down?” were problematic. George understood these kinds of rhetorical questions as questions, rather than commands or directions, leading many teachers to think of him as disobedient. Listening *to* George, rather than listening to others talk *about* George, Souto-Manning noticed his eagerness to interact, inquire and participate in class discussions. Other work by Souto-Manning and colleagues has focused on engaging young children in discussions about inequities in the nature of employment and work, race, diverse sexualities, as well as examining the intersectionalities between many of these issues.

Rebecca Rogers

In her presidential address to the Literacy Research Association, American scholar Rebecca Rogers (2018) noted that “literacy research has an entangled history with racial justice” (p. 24) because it has been part of systems that have subjugated and marginalized peoples, restricting access to education, health care, housing and other privileges. For this reason, she argued that literacy research must continue to examine how literacy shapes the flow of knowledge and power; and take care to avoid further reproducing unequal and unjust power relations. Rogers’ used critical race theory to compare her own family history with that of one of her research participants, a Black woman, June and her family: she found that while her family benefitted from access to

education and property, June's family were excluded from education by literacy assessments that "became a proxy for discrimination" after Jim Crow laws were abolished (p. 29). Rogers' work (e.g., 2011) with June and her family provides moving accounts of the subtle practices in schooling (such as being tracked into special education programs) can operate to perpetuate racial injustice.

Rogers has published extensively, with much of her work using critical discourse analysis, to provide practical examples of how teacher-researchers might better understand diversity and use critical literacies to further social justice agendas. Acknowledging the micro-politics and action that form everyday life is important because it acknowledges the subtle ways that power can be exerted and challenged in classrooms, playgrounds and beyond. In her work with Labadie and Wetzel (Labadie et al., 2012), she shows how a teachers introduction to a book can become a time where readers are encouraged to disrupt common-sense assumptions embedded in texts; to consider diverse perspectives; and to tackle issues of power and justice. While the texts that teachers select in their classrooms are important, this work highlights the importance of how texts are taken up in classrooms, for example by allowing time for students to ponder unequal relations and silences in texts. Examining the micro-practices of teaching reveals how moments such as lesson introductions that are often overlooked, or seen as a moment for a teacher to impart their own lesson structure, can become a time for sparking critical thinking about issues of justice and diversity. This work shows how activist teacher-researchers can use small moments in lessons to create "an ongoing discussion and reflection about a book instead of only an opening" (p. 127) in ways that recognize diversity and explore locally relevant questions. This attention to everyday doings in classrooms, including how texts are taken up in lessons, requires a stance in which there is a consistent exploration of issues of privilege, diversity, power and justice.

Gerald Campano

Gerald Campano's work in critical literacy centers around the way immigration can affect the educational experience of students. In the field of critical literacy, Campano's work has shown the value incorporating the experiences of immigrant students into curriculum choices. Campano, who teaches in the United States, describes himself as a proud third generation Pinoy with ancestral roots in the Mindanao region of the Philippines. His work shows the value of teachers who are intentional in encouraging migrant and refugee students to share their narratives, and to feel that their personal cultural identities are represented and valued both in school and in the wider community.

Campano has drawn heavily on the scholarship of Marilyn Cochran-Smith and Susan Lytle, describing Lytle as his mentor and the center of his work (Campano, 2019). Their inquiry-based approach has therefore been important in Campano's approach toward agentic, participatory inquiry, as he works alongside students and community members. Campano therefore writes from his own experience, as well as the lived experiences of the immigrant students he interviews. By making visible the embodied knowledges and experiences of immigrant communities, his work in critical literacy is based on the view that it is imperative that teachers and communities build a shared vision of justice and rights.

His work also encourages students to engage in critical inquiry themselves, questioning ideals they had previously taken for granted, particularly relating to the issue of race, class and immigration (Beach et al., 2015, p. 142). 'Immigrant Stories and Literacy', for instance, is a compilation of critical stories of the classroom life of immigrant students from Campano's fifth-grade class. In it, he reflects on his early question: "What would happen if I invited children from immigrant and migrant backgrounds to read, write, and speak from their own experiences and the realities of their lives?" (p. 31). A key argument in Campano's work is that it is possible for teachers to make space for children to draw on their cultural traditions, and to resist the dominant culture of standardization and quantification that has characterized much of literacy instruction. This approach recognizes the important contributions of students who might normally be marginalized by literacy instruction, and instead, to offer space to for students to generated sophisticated insights about issues of justice that are based on their own life experience.

Campano's work draws on foundational critical literacy theorization, such as that of New London Group. For example, in his paper with Low, "The image becomes the weapon" (Low and Campano, 2013) examines the privileging of canonical texts, before looking at how this is taken up in the classroom with students:

what we have learned... is the need to view all students as cosmopolitan intellectuals... who have the capacities to think transculturally and across genres, making any texts they may encounter potential grist for their creative mills. The canon is not solely a mechanism to be reproduced; it is also critically reinvented by our students (p. 31).

In his analysis of the kinds of texts that US schools use to explore the experiences of immigrants, he shows how the dominant views around the importance of an "English only" approach silences the experiences and views of multilingual students; and their hybrid language practices and experiences. His analysis (Ghiso and Campano, 2013) of the book *One Green Apple* in which a young South Asian girl talks about going to school "where I will learn to speak English," shows the conflation between schooling and learning the English language. Instead, he argues that teachers adopting critical literacy approaches must learn to listen to community members and students, which requires substantial time and "intellectual and empathetic labor" (p. 55). This important work shows how justice requires a collaborative approach between teachers, students and communities, in which teachers take account of local actualities, such as community experiences of multilingualism and multiculturalism.

Rob Simon

Rob Simon at the University of Toronto's Ontario Institute for Studies in Education has co-authored with Campano to examine critical literacy among adolescents. Partnering with teacher researchers, the pair published *Activist literacies: Teacher research as resistance to the 'normal curve'* (2013). This work examines the institutional constructions of "gifted and talented" and "special needs" in two schools from vastly different socio-economic and cultural regions in the US. Their use of critical disability scholarship frames their understandings of how activist literacy educators can (and must) contest dominant discourses, for example in understanding "normal," bell-curved constructions of student achievement. Conceptualizing disability as a social construction rather than a medical, individually embodied pathology provides a lens for teacher-researchers to resist assumptions about students, and to "take social location—their own and their students'—seriously" (p. 25). This view challenges dominant views of literacy that rely on deterministic understandings of young people as literate beings based on narrowly constructed literacy assessments. Instead, Simon and Campano's work demonstrates how teacher/researchers can assume that there is much more to learn about students, and work together to develop rich understandings of students' literate practices and needs. Drawing on the work of Cochran-Smith and Lytle (2015), they explain how this theorization "from the thick of things" (p. 22) helps teachers to understand students' everyday lives.

Adopting the view that teaching literacy should not be seen as an intervention performed by teachers, means looking for moments of dissonance that exist in everyday life to inquire into rich lives of diverse groups of students, to question existing power structures, and to reveal and contest the inequities that affect students and their communities. Simon (2012) has documented how pre-service teachers can engage in the practice of learning from and alongside students, with justice in mind. His account (Simon, 2012) of a pre-service teacher inquiring into the challenges faced by an adolescent student, Yusef, shows how teachers can become "connoisseurs" of students' complex identities and practices. In so doing, he reveals how adopting an inquiry stance can change how teachers see students, often moving from deficit views toward more complete understandings of the out-of-school, multiliterate practices of young people.

Amparo Clavijo

Amparo Clavijo is another scholar who has drawn on Comber's work in critical literacy in her explorations of community-based pedagogies, particularly in Colombian public schools. This body of work examines issues of power through having students consider local issues that affect their lives and neighborhoods.

Her most recent research focuses on Community Based Pedagogies and Literacies in Language Teacher Education. She has published articles and book chapters about Colombian public school teachers using community pedagogies with students to inquire about social and cultural issues that affect their neighborhoods. Her work draws teachers into critical literacy, through encouraging them to consider their own personal and professional journeys. For instance, in a chapter she co-authored with Ramírez Galindo (2018), the authors used self-study to consider how community pedagogies are enacted in socioeconomically and culturally diverse schools in Colombia. In particular, they considered how national language policies and practices in Colombia that draw on foreign curricula, textbooks and standards can impose social and cultural norms that do not include local knowledges and practices.

Through her journey from the oldest daughter growing up in a patriarchal culture, to her experiences as a Fulbright scholar and Colombian language teacher-educator, Clavijo reflects on how she brought together the theoretical traditions she has used in her approach to critical literacy. Her experiences are reflective of a Western-centric focus that has dominated critical literacy research and practice. For instance, she explains (2018, p. 43) that she was not introduced to Paulo Freire's work that promoted emancipatory pedagogies in rural Brazil until she attended a doctoral program in the United States. This reality—in which she suggests local scholarship in teaching and teacher-education must be strengthened—is part of Clavijo's critical literacy agenda. Her promotion of Freirian pedagogies has since been used to respect the languages and cultures of Indigenous children and communities. This is not to say that Clavijo's work is not underpinned by broader scholarship on critical literacy that meets the needs of disadvantaged and marginalized communities and students. For instance, she has drawn on Comber and Kamler's (2004) notion of "turnaround pedagogies" with teachers and pre-service teachers, to encourage an approach to literacy that is intentional in refusing to begin from a view of children and families as being in deficit.

Clavijo and colleagues developed their approaches using the theoretical work of a range of critical theorists from Butler to Gramsci, Foucault and the New London Group. Her attention to reflexivity, self-consciousness, and "reading the community critically" (Medina et al., 2015) demonstrates how such scholars are able to work toward justice in diverse settings, by using a diverse range of theoretical approaches to make sense of their worlds and that of their students, so that critical literacy is used to forward liberatory agendas.

Jennifer Alford

Jen Alford is an Australian teacher and scholar whose work in critical literacy focuses on the classroom practices of teachers as they embed critical literacy into their work with adolescent English language learners. With similarities to other critical literacy advocates such as Vasquez and Campano, Alford's work shows that English language learners in Anglophone countries and schools remain capable of engaging with texts, and adopting critical readings. Alford's work (e.g., 2022) is unique in that

it provides a detailed look at *secondary* school aged students who are learning an additional language. As she describes, the literature on these adolescent learners is sparse, despite the ‘assessment stakes [being] higher in pre-tertiary [years of schooling]’ (p. 17). For example, in the state of Queensland where her work is primarily conducted, externally administered and graded English examinations are worth 25% of every students’ grades in their final year of schooling. As Alford explains, high stakes assessments such as this have the potential to impact on teachers’ willingness to adopt critical literacy approaches. Her work draws attention to the hegemonic nature of standard English in schooling, particularly for adolescent learners. As she points out, it is rare for Australian teachers to draw on learners’ range of linguistic resources, instead insisting on English as the dominant mode of communication. Her work shows how critical literacy can be used to disrupt this practice by validating all languages in the classroom (Alford, 2019). She shows how the explicit teaching of language structures as part of additional language instruction provides an opportunity to problematize and contest linguistic choices. She also argues for the importance of pedagogical practices such as the use of translanguaging, which integrates learners’ knowledge of multiple languages, allowing them to move between languages to maximize communication: ‘It is also a pedagogical approach teachers can adopt that makes full use of learners’ language repertoires. Learners can research topics in their own languages, discuss texts and issues in their own languages in classrooms, and use their own languages in the production of texts’ (p. 180). Her work demonstrates that critical literacy in classes with adolescent learners is especially significant, given that they are often at the forefront of political change. The past decade has been characterized by numerous movements such as those seeking reform on climate change, domestic violence, gun control and policing reform have included activism by young people. As Alford (2022) writes, ‘these events are timely reminders of the keen interest adolescents have in ideological matters of concern to their own futures. Critical literacy provides a way for them to engage with these matters and find much-needed solutions. In a post-truth world where much uncertainty prevails, critical literacy is a basic for all young people learning to be literate’ (182).

Concluding remarks

The current period is marked by political upheaval in countries around the globe, a proliferation of mis/disinformation promulgated on social media platforms, and an increasing rejection of rising inequality and injustice. As individual countries and societies deal with their own inequality and political upheavals, we cannot minimize global inequality and inequity between countries and regions. We note that we have situated this discussion from our own context of Australia, an Anglophone country with a westernized mass education system, and experiencing similar political tussles to other western countries. While our conversations are grounded in this context, we hope to have provided a sense of what is possible when teachers, students and families leverage critical literacy to disrupt dominant power structures. We argue that critical literacy has been a vital tool in equipping young people to question the taken-for-granted truths that circulate and maintain oppressive power structures. Amidst a global pandemic and an increasing frustration over continued injustices perpetrated on Black and LGBTIQ+ lives, critical literacy is continuing to play a part in how educators help students to engage with the world around them. The examples of scholarship provided in this entry are by no means definitive, but rather have been used to demonstrate the depth of work being carried out by teachers and researchers with the view of adopting a stance in their approach toward literacy that is intentional in tackling issues of justice. While new public management practices have entered literacy education with the aim of bolstering and competition using literacy data collected through high-stakes standardized tests, the teachers and researchers who engage in critical inquiry have shown how these goals can be displaced by the use of range of data to inquire into issues of power, oppression and justice; and to signal a focus on democratic traditions and goals.

Glossary

Power/Knowledge Knowledge is not neutral nor universal, it is instead understood as historically specific and always implicated in questions of social power—Power and knowledge are mutually constitutive (Barker and Jane, 2016; Foucault, 1980)

Ecocritical Drawing on a similar definition as ecocriticism—which is the study of literature and the environment from an interdisciplinary point of view; ecocritical refers to interdisciplinary work that: is critical of Western industrial culture (specifically Modernity) and its impacts on social and environmental systems; examines the relationships between language, culture, and value-hierarchies prevalent in Western industrial culture; and working actively to identify how to teach or share skills and habits of mind that support social justice and sustainability

Ecojustice Education Educational efforts that recognize that both ecological degradation and social justice issues have deep cultural roots in Western industrial colonial cultures, and that educators can—and ought to—center the health of local and global ecosystems as essential to all life, while recognizing the cultural assumptions that undergird socially constructed value-hierarchies that reproduce racism, sexism, classism, ableism, speciesism, etc. (Martusewicz et al., 2021)

Equity Referring to fairness and justice and important to differentiate from equality. Equity frameworks acknowledge diversity of needs

Individualism The deep belief that individual human beings are independent autonomous beings and that individuals in pursuit of their own self-interests leads to a greater society. This deep cultural belief falsely positions competition as human nature. It is important to differentiate individualism from the important concept of individuality which is the recognition that everyone has unique differences in how they identify and contribute in society

Anthropocentrism A logic structure of thinking that situates, or positions, human-beings as the center or top of a socially constructed value-hierarchy of all things. This deep belief becomes the basis for human-supremacy and is inextricable from the logics of racism, sexism, classism, ableism, etc.

Interdependence The idea that all beings are related and have mutual responsibilities and contributions to one another. In other words, we are all dependent on one another and the diversity of life that contributes to a balance in the ecosystems within which we all live. This concept can be understood through the Buddhist concept of dependent

Earth Democracy A decision-making system that empowers local communities to value and acknowledge diversity together with an intrinsic worth of all species in all decisions. All decisions are made by and with consideration for all that is impacted by the decision being made and in protection of the basic foundations of life for the present as well as for future generations (Shiva, 2015)

Bioregion A locale defined by characteristics of an ecosystem rather than by man-made divisions or state borders

Introduction

Considering the difficult conditions for diversity and life on the planet due to climate change (IPCC, 2022)—and the connected consequences including, but not limited to: poverty, famine, pandemics (Shah, 2020) and increased violent conflict as a result of devastating inequity—educators as leaders are presented with the challenge of rethinking education and doing so with close attention to what can be done differently in curriculum and pedagogy. In this era, one in which global climate change is threatening the very existence of human and more-than-human communities, as ecocritical teacher educators and curriculum scholar-activists we turn our attention toward the possibilities of radically reconsidering the purpose, and the associated procedures and practices, of not only teacher education but also of PreK-12 schooling.

Critical scholarship in education over the past few decades has a strong tradition of calling into question the relationship between knowledge, power, and curriculum. Building on critiques of how neoliberal policies support and promote particular kinds of “knowledge” (rooted in capitalism, patriarchy, and white cis hetero-human supremacy) and regimes of truth as a core foundation of curriculum content and pedagogy, we are interested specifically in how these regimes of truth are learned, and hopefully unlearned, via disrupting dominant curriculum through the employment of an ecocritical approach in education. While there are a handful of important radical frameworks in critical education that contribute to, and fall under, what we define in this encyclopedia entry as *ecocritical*, we want to be clear that the ecocritical framework we share here—and the associated pedagogical practices and recommendations—draws on a variety of radical traditions in educational scholarship that offer up possibilities of critically addressing the cultural roots of social justice and sustainability in classrooms, schools, neighborhoods, and communities.

Responding to the systemic violence and exploitation perpetuated by the current dominant social, economic, and environmental contexts in North America (similar to other nation states embedded in Western industrial culture), ecocritical educators examine and address how it is that schools in Western industrial societies create, support, and sustain the habits of mind that rationalize, justify, and (re)produce unjust social suffering and devastating degrees of environmental degradation inseparable from a devaluing and loss of human rights. Ecocritical work, like many other critical frameworks, considers how power and knowledge (power/knowledge) are intimately and inextricably connected (Foucault, 1980), emerging from specific power relations to form one of several truths. Given this, Truth (emphasis of capital T) does not exist, but instead truth is a cultural “good” describing the world with practical consequences (Barker and Jane, 2016; Rorty, 2009)—an epistemological product of specific group(s) interests always immersed within (and influencing) the social context. Adding to the critical tradition to examine, and trouble the Eurocentric notion of one Truth, in favor of a diversity of cultural truths that contributes to a dynamic knowledge system emerging from democratic and scientific consensus; an ecocritical framework places specific attention on the problematic notion that humans exist as separate from and superior to not only one another but also from the ecosystems the planet’s capacity to support human life as part of diversity of species.

When faced with such a challenge, an ecocritical framework can be understood as a line of inquiry through which scholar-activist educators ask the questions: *How is it that exploitation is rationalized, justified, and/or (re)produced by teachers, the curriculum, and schools in general?* Furthermore, scholar-activist educators working through such inquiries are also committed to turning the critical lens inward and asking: *What can be done in order to teach in support of alternatives to Western industrial culture?* In an attempt to address these questions, we introduce what we are referring to as an ecocritical framework for curriculum and propose engaging in pedagogical practices as a way to explore the possibilities and potentialities for diverse critical ecological perspectives in education.

An ecocritical framework addresses how education is influenced by systems of exploitation and violence, systems which rely on a refusal to acknowledge and embrace mutuality and interdependence (Lupinacci and Happel-Parkins, 2015, 2016). Ecocritical scholars in education use diverse critical lenses for addressing and rethinking dominant cultural frameworks, but certain principles remain at the center of the work. Specifically rooted in and simultaneously pushing the boundaries of the critical tradition, teacher educators positioned within the ecocritical movement recognize that social and environmental justice are inseparable and inextricably linked, and that these injustices rely on the perpetuation of cultural habits—like domination, individualism, and consumerism. They also acknowledge that such habits are deeply rooted in value-hierarchized, often dualistic, social thought—dualisms like culture/nature, male/female, mind/body, and reason/emotion—that influence collective attitudes and unexamined behaviors. To dismantle such injustices, then, these scholar-educators analyze the culturally-constituted value hierarchies our society is reproducing. This approach also includes exploring alternative knowledges and ways of recognizing and understanding differences that move beyond the limitations of Eurocentric (or Western industrial) thought and the complex tensions, double-binds, and even contradictions that exist within our modern cultures and so many of the short-term solutions. For example, we often find ourselves consuming goods in an effort to improve our lives and even support “green” practices, but our relationship to these goods, to the people who create them, and to the beings who supply the materials, remains invisible and unquestioned. Our methods of consumption and participation in society are deeply influenced by our culture’s hierarchies of value. As such, scholar-activist educators ask: *How are our social practices and relationships dependent on privilege and exploitation, and in what ways might these practices and relationships be restructured to be more inclusive without exploitation and exclusion?*

Introducing an ecocritical framework

An ecocritical framework strives to organize scholar-activist educators to learn from, connect with, and engage in identifying and critically examining the role that education both plays, and ought to play, in transitioning toward supporting diverse, socially just, and sustainable communities. Drawing from EcoJustice Education (Martusewicz et al., 2021), and stemming from the growing field of ecocritical work in social and cultural foundations of education, we summarize the movement’s aims in three aspects. Ecocritical perspectives help educators to critically and ethically (1) examine Western industrial culture, in relationship to the global spread of hyper-consumerism and its impacts on social and environmental systems; (2) examine value-hierarchized dualisms, and the associated behaviors and mechanisms that contribute to inequities such as racism, classism, sexism, disableism, anthropocentrism, etc. in connection with degradation of the environment; (3) examine and identify how to teach or share skills, and habits of mind, that support socially just and environmentally sustainable communities (Lupinacci and Happel-Parkins, 2016). Furthermore, the ecocritical framework we share here is informed not only by an EcoJustice Education perspective but also from EcoFeminism (Plumwood, 1993, 2002), Ecopedagogy (Kahn, 2010), Ecocritical Pedagogies (Lupinacci et al., 2019), Critical Place-based Ed

(Gruenewald, 2003; Gruenewald and Smith, 2014), and Indigenous and Land Pedagogies (Basso, 1996; McCoy et al., 2017; Tuck et al., 2014).

Simply put, through an ecocritical framework, educators work to support learners in recognizing two conflicting and foundationally different worldviews—on the one hand, ecological worldviews of diversity, interdependence and interspecies equity (see Fig. 1); and on the other, a human-centered worldview informed by human-supremacist hierarchal capitalist, racist, and patriarchal relationships (see Fig. 2).

It is important for educators to simultaneously learn to recognize how diverse worldviews rooted in interdependence and multispecies exist and have much to offer while also learning to recognize how the power/knowledge relationship works in a capitalist, patriarchal, white cis-hetero human supremacist cultural worldview, and how this particular worldview shapes knowledge and epistemological understandings of life and relationships. We assert that it is important within ecocritical efforts to engage in pedagogical work to disrupt the latter framework through examining how such a worldview (as illustrated in Fig. 2 below) might be reconstituted—via education or what we refer to later in this entry as *ecocritical pedagogies*—in ways that are local and in support of living systems.

Working through and within an ecocritical framework often include students and teachers examining how knowledge systems and the associated behaviors and mechanisms of human domination—in relationship to language, culture, and power—are culturally mediated, and how PreK-12 educators can play a role in reconstituting those understandings, behaviors, and mechanisms. Furthermore, with(in) such a framework, it is important to recognize that the role of teacher can be taken on by more-than-human members of any learning community. By highlighting how many dominant cultural belief systems, root assumptions, and narratives currently destroying the planet and prospects of peace are constructed and not simply “natural,” educators can help students develop critical perspectives on these root beliefs. This undertaking also allows for the exploration of alternative belief systems and metaphors that facilitate different kinds of relationships with other people, other beings, and the land.

An ecocritical framework also illuminates the systematic economic and political restructuring of lives that, while it might address immediate needs of human or environmental systems, ultimately often perpetuates unjust social suffering and extreme environmental degradation. Rethinking education through an ecocritical framework require moving beyond a simple critique of technological development that portrays technology, or humans, as the problem or the solution. For example, on one hand being critical of the dominant systematic economic and political restructuring of lives in current hyper-consumerist Eurocentric cultures includes also recognizing how technologies like pace-makers and vaccines have been, and probably ought to be, valued contributions to addressing human suffering. However, ecocritical work requires that teachers and students also ask how these valued technologies may or may not be sustainable and equitable via renewable resources and fair labor. Ultimately, addressing unjust suffering in society is important, but it must also include an awareness and analysis of the impact of any proposed solution on several generations of both human and more-than-human communities. What has become commonplace over the past century,

Fig. 1 Multispecies equity worldview: diversity, interdependence, & equity.

Fig. 2 Anthropocentric cultural worldview: individualism & human-supremacy.

and extending into the current, is the intentional restructuring of relationships to control and commodify lives in order to maintain and manufacture markets. For example, food and water are life-sustaining elements necessary for supporting healthy communities. However, the relationships to these “resources” have been enclosed—that is, they have been monetized or understood as commodities to be earned and purchased. This iteration of capitalism as a “supply and demand” economic system predicated on exploitation works to enclose living systems and can be understood as the globalizing force to commodify and privatize that which is common and public. Critiquing this kind of enclosure means reimagining the sorts of relationships humans can have with the more-than-human world and with each other, rather than simply trying to make human behavior “less bad” by slightly reigning in current destructive practices.

In short, an ecocritical framework calls for pedagogical efforts that center student learning on recognizing the importance of examining intellectual, environmental, and cultural practices and traditions in regard to how they either support or undermine living systems together with whatever content is being taught. Whether examining discursive practices or economic structures while learning mathematics, language arts, science, or social studies, a key feature of ecocritical pedagogies is the recognition that human knowledge systems are culturally constructed, have consequences for all living beings, and can be re-imagined in transformative ways (Turner, 2015). Another distinguishing aspect of ecocritical pedagogies is that whatever the lesson or activity, students and teachers together address the powerful role that their culture plays in the development of themselves, their values, and their diverse relationships. Such a framework examines, explores, and proposes diverse and collaborative pedagogical projects that respond to current dominant belief systems, and works to ensure that any responses are necessarily collaborative with diverse cultures in ways that are local, situational, and in support of decentralized living systems. In the classroom, this might include examining clips from news media to determine what root metaphors are at work in the way our culture communicates about the more-than-human-world. It might mean exploring personal relationships with nonhuman beings through art or creative writing. It might mean comparing historical writings about race, gender, and species. Or it might mean using interdisciplinary knowledge to investigate a local issue of environmental justice.

A primary premise in ecocritical work in education that differentiates this approach from most other critical frameworks is the explicit recognition of the entanglement of human supremacy and Eurocentric culture—that is, the embedded worldviews and belief systems originating in Western traditions of thought, which have colonized much of the world. Ecocritical educators assert that situated at the root of social and ecological injustice is a fundamental—and problematic—assumption that humans, as a species, are understood (or self-identify) as superior to and somehow separate from all other living beings and non-living things. Thus, guiding an ecocritical framework is the understanding that the manifestation of a human-supremacist worldview is culturally constructed and inextricable from current Eurocentric industrial dominant cultural assumptions about race, class, gender, ability, age, and so forth. A foundational tenet in ecocritical work in education is that cultural habits of mind in dominant Eurocentric industrial culture are based on a system of human-supremacy—stemming from anthropocentrism—and that such a perspective is ubiquitous throughout dominant colonial culture and informs how we as humans in such a culture learn to interpret and assign value to differences.

Anthropocentrism as it contributes to human-supremacy: teaching in support of an Earth Democracy

Anthropocentrism, or human-centeredness, is a belief system that privileges humans over other species and functions to maintain the superiority of human existence by marginalizing and subjugating anything nonhuman (Plumwood, 1993, 2002). Radical ecocritical scholars and educators take the position that anthropocentrism is so pervasive in the metaphors by which we teach and learn in Western industrial schooling that, in order to interrupt the dominant belief system, educators must first learn to name and recognize anthropocentrism as problematic in connection with what can be done to rethink the vital relationships upon which we all depend. Given how dominant and foundational anthropocentrism is in schools and society, we suggest that teachers and teacher educators can—and do—play a key role in addressing and interrupting anthropocentrism, and that they must furthermore consider what a non-anthropocentric education might look like.

Ecocritical work continues and pushes the boundaries of the work of social justice scholar-activists within critical education spaces by making clear the connections between human-supremacy, patriarchy, racism, and other forms of domination like ableism, ageism, and classism. Ecocritical scholars understand that each of these value-hierarchized structures of domination, based in binary hierarchical thinking, mutually reinforce one another, while they obscure the fundamental interdependence and interrelationship of all beings. These hierarchies inform dominant cultural assumptions in Western industrial culture, and they are all based on normalized logics of domination, which means that they are inseparable and intersect in complex and contextualized ways. For example, the water crisis in Flint, Michigan or Indigenous Water Protectors in the global north (LaDuke, 2020) protesting the oil pipeline illustrate the complex intersections of anthropocentrism, racism, capitalism, etc.

Another key aspect of ecocritical work is to radically reconsider decision-making practices commonly referred to as democracy. Democracy is too often experienced as a decision-making process in which elected representatives make centralized decisions with an emphasis on voting which hinges on a majority rules mentality. This kind of decision-making (majority rules), while argued as efficient, is not at all democratic and in fact is highly exclusionary based on race, class, gender, ability, and species. Directly stated, democratic decision-making ought to be understood and practiced as: decisions being made by all those directly impacted by the decisions.

Most examples of democracy that are discussed are highly anthropocentric, and so as ecocritical educators it is important to interrupt/disrupt the power/knowledge idea that only humans (and too often only certain groups of human beings) matter in the decisions being made. We build into an ecocritical pedagogy learning about decision-making rooted in consent, consensus, and with respect for a diversity of cultures and species. An ecocritical approach to such a shift focusses on local decision-making that is responsive to and responsible for the sustained health of cultural diversity and biodiversity in the present and for several future generations. Working to interrupt and expose the diverse ways that anthropocentrism works to undermine our capacities and facilities for recognizing and valuing diversity in our decision-making can begin with relocating decision-making practices from distant centralized capitals often associated with colonial constructions of the nation-state and organizing more bioregionally with attention to diverse cultures and species locally.

With so many democracies around the planet eroded by corporations and private interests rooted in neoliberal capitalism, we have found Shiva's (2015) conceptualization of Earth Democracy to be of most use in rethinking the role of education. Specifically, Shiva (2015) helps us to think about how we can create educative spaces that support the development of a global citizenry that is not a monoculturalization of Eurocentric ideals but rather contributes to a future inclusive of a planet of diverse democracies not reliant on nation-states or centralized control. Shiva (2015) defines Earth Democracy as "consisting of the local, decentralized communities which include (and protect) all diversity in nature and culture" (pp. 8–9). Through the practice of a living democracy, decisions are made not only by those making the decisions at the most local levels, but in defense for more-than-human-species. This decentralized approach, described as localization by Shiva (2015) is:

Based on the interdependence between nature and culture, humans and other species, local and global, micro and macro, thus entailing an obligation of responsibility and eco-citizenship. Localization treats every place as the center of the world, placing every person, every being as the center of ever widening circles of compassion and care (p. 73).

Thus, Earth Democracy prescribes "self-rule and self-governance" to the communities and ecosystems which they are a part of (2015, p. 9).

As history continues to repeat itself in vicious cycles of tyrannical governments usurping power from local democracies—often in the proclamation of democratization—an example of an ecocritical position includes asking the question: *Are there any potential solutions to environmental and social injustices among nation-states that have been more than symbolic? And, Are there possibilities for organizing decision-making with emphasis and priority on diversity, social justice, and healthy ecosystems?* Contrary to models of decision-making rooted in an Anthropocentric Cultural Worldview (see Fig. 2), central to an ecocritical framework is turning local educational efforts and attention toward asking: *How might we embrace and value diversity in our social decision-making structures? And, What might it be like to learn from and with local systems of shared governance which nurtures ecojustice, political autonomy, and accountability through bottom-up democracies?*

Shiva's (2015) concept of Earth Democracy challenges the dominant form of social organizing globally, the nation-state model, with globally individuated populations governed largely by a political minority (be it a few representatives or even a single figure).

In an Earth Democracy model, which aligns with a Multispecies Equity Worldview perspective (see Fig. 1) put into practice, political power begins and emanates from the bottom up. This emerges where, “Authority is delegated to more distant levels of government on the principle of subsidiarity: things are most effectively done at the level closest to where the impact is felt” (2015, p. 57). This change from globalized market economies (based on greed and violence) to a “living economy” (based on compassion) cultivates better capacities of humans and the nurturing of living democracies for diverse species (2015, p. 75). Given such attention on addressing how a human supremacist Eurocentric worldview undermines diversity and democracy we turn to pedagogical suggestions that understood through an ecocritical framework contribute to what we refer to as ecocritical pedagogies—or efforts in education that directly emphasize learning to value the interconnectedness of all species and the interrelated ways that biological and culturally diversity are primary to how organize and learn to make decisions together as human cultures together with our local ecosystems.

Ecocritical curriculum and pedagogies: teaching for a just and sustainable future

Now more than ever, educators need to engage in pedagogies which encourage recognition of (and resistance to) all forms of domination. Doing so furthers the potential of fostering spaces of learning together to recognize harmful assumptions and actions which undergird social and ecological injustice. We admire, value, and are firm supporters of a shared commitment to respond to the undeniable atrocities that we—as humans—enact on one another. But we also believe that these atrocities are inextricably connected to the cruelties we perpetuate against non-human animals and the environment. None of these atrocities occur in isolation; they are all interconnected and mutually reinforcing. Hence, the importance of focusing on the social and ecological: diverse bioregions. To confront human supremacy together with other forms of supremacy in education, educators must work as committed allies to those suffering while challenging and confronting the systemic roots of oppression on our respective fronts. An *ecotistical* approach focusing on the pedagogies of diverse bioregions can help highlight the interconnectedness of the social and environmental.

Drawing on the ecocritical framework introduced in this entry, we propose that an ecocritical pedagogy might be best understood as pedagogies of diverse bioregions. Such a relocation of learning from the abstract idea of ecocritical to the concrete concept of a bioregion draws on these aforementioned ecocritical traditions and invites educators to address social and environmental injustices occurring at the local and global through a multispecies equity worldview perspective (See Fig. 2). Doing so always requires identifying social and material relations and challenging oppressive cultural frameworks which impact *all* species and places. Oppressive cultural frameworks like those emerging from pervasive and extreme anthropocentrism, must always be considered as connected to or closely related to upholding racism, cis normative heteronormativity, sexism, classism, disableism, and so on. The models for thinking through these oppressive mindsets in educational contexts are useful when we are teaching with folx within cultures that predominantly are based in what we presented as an Anthropocentric Cultural Worldview (See Fig. 2). We want to be clear that what we present for teaching purposes as a multispecies equity worldview perspective represents what many diverse Indigenous cultures have as a fundamental understanding of self in relationship to community. We aim our work at exposing how in particular how Western industrial cultures deeply entrenched in patriarchal, white, and human supremacism combines with hypercapitalism and ableist heteronormative individualism to constitute deeply problematic relationships among humans and also among humans and the more-than-human world. In other words, we want to be clear that we acknowledge that diverse Indigenous cultures do not need this process and that what we share is not in any way new. Rather, our hope is that the kind of work we are sharing and proposing aides in developing the awareness, knowledge, and abilities for educators in Western industrial culture to practice recognizing diverse knowledge systems and intentionally working to value different variations of a multispecies equity worldview perspective that for centuries have sustained human communities living in accordance with the diverse species, geographies, and climates in their bioregions. We hope that this kind of work better prepares white colonial patriarchal educators, or educators steeped in Western industrial cultures, to better partner with diverse educators and worldviews that share a commonality in that they do not place humans as singular beings who assume or strive to maintain supremacy.

Ecocritical pedagogies of diverse bioregions also require a fluidity of learning and doing in both the material and the cultural. Recognizing and protecting local watersheds from profit margins such as Elwha Dam Indigenous protests (Norman, 2018) and Indigenous resistance in the Brazilian Amazon (Langlois, 2022); engaging in guerilla gardening (Reynolds, 2014) to circumvent private property and food deserts—these are just some examples of engaging in pedagogies of diverse bioregions. For educators and teacher educators, we can begin to challenge oppressive cultural discourses in our classrooms. Below are some preliminary suggestions that are emerging, and always situationally evolving, from ongoing work with diverse scholar-activist educators (Edwards-Schuth and Lupinacci, 2021; Lupinacci et al., 2018, 2019, 2023) that help us to continue to move toward unlearning assumptions and practices in education rooted in an Anthropocentric Cultural Worldview in favor of recognizing and valuing how we might begin to utilize an ecocritical framework toward diverse pedagogies of bioregions in our classrooms, relocating decision-making and power to be local and in support of living systems.

- Engage in teaching and learning that explores diverse projects to rethink the dominant assumptions influencing how we, as humans, construct meaning and thus how we might learn to challenge the power/knowledge patterns in our communities through rethinking how we relate to each other and the more-than-human world. Further, make the commitment to critically and ethically examine how, as teachers, we individually and collectively understand educating, organizing, and taking action

toward supporting healthy communities that include all beings and the intrinsic value of recognizing, respecting, and representing the right of all beings to belong to and live peacefully within an ecological system. For example, critically engage in questioning how we language our world. *What does it mean to refer to stacks of trees or the waterways on the planet as “natural resources”? What does it look like to advocate for the diverse species of our bioregions? What language further perpetuates social inequalities and undermines human rights in our communities?* Furthermore, as educators, think about how we might frame lessons that include ecocritical questions that disrupt dominant worldview assumptions. Asking: *What does it mean to be human beings in our diverse communities of life? Who/what benefits and who/what suffers? How are learning relationships in our classrooms influenced by value-hierarchies and cultural assumptions? What does it mean to teach toward the abolition of Superior/inferior (Either/or) thinking and decision making and in support of challenging human supremacy in favor of anti-racist and feminist teachings as part of any relationship to places or transition to pedagogies of bioregions?*

- **Engage in critical and ethical examinations of how dominant power/knowledge schemas shape our understandings of community and how such work might offer alternative to how we come to learn about one another, make decisions, and live together with diverse species in our bioregions.** As notions of community are all too often defined in terms of white supremacy, patriarchy, and human-centered exclusion, it is important to work to reconsider community in terms of who and what is included in our definitions of this construct and how those definitions contribute to either supporting or undermining the right of all beings to coexist in peace. *Who and what might we be ignoring when we think about who is considered in decisions in our neighborhood community? What animals and plants live and make homes in our community, and how are we interrelated to them? What are we doing to practice reciprocity with our diverse human and more-than-human neighbors?* As educators we can work with our students to learn deeply about the local and to imagine how decisions might be made that consider more broadly how important it is to center diverse voices, ideas, abilities, and experiences given a historical dominance of white male colonial voices. Consider engaging students in learning to listen and be responsive to diverse language systems like breathing, smelling, listening to diverse sounds, gestures, and recognizing the diverse weather, climate, water, soils, birds, insects, fungi, forests, and other mammals and animals in our bioregions. Specifically, work to identify—or seek out—a more-than-human teacher in a local bioregion (something/one you learn from and intentionally engage in a learning relationship). At first, this is just about making a commitment to learning from this different kind of teacher–student relationship in a way that interrupts habits and assumptions of anthropocentrism and human-supremacy. Then, journal over the course of the semester and share your experiences with how you learned from, and learned to listen to, your ecological surroundings. Commit to learning about the ways in which oppressed communities have suffered and survived the extreme violence of white-male heteronormativity and to not reproducing or existing in complicity with these atrocities.
- **Engage in examining community in terms of inclusion and the diverse ways in which our living relationships can be recognized, respected, and represented through teaching and learning that interrupts and exposes dominant power/knowledge assumptions and practices in favor of learning to value and implement changes that welcome a sense of belonging, justice, and democracy for all members rooted in supporting systems of bioregions working cooperatively and with solidarity across bioregional differences.** Specifically, engage in recognizing the role activist networks play in alleviating and eliminating unjust suffering in our communities. Build networks of solidarity with these organizations. *How can single-issue or locally focused social justice groups make alliances with other social and/or environmental justice groups?* For example, in our community, we ask *what commonalities and bridges might there be between Water protectors, ANTIFA, Planned Parenthood, the Black Lives Matter movement, and the Sierra Club?* Internationally, we ask *what might efforts to address global climate change have in common solidarities with human rights issues especially with rises in the forced displacement of women and children as refugees from global conflict, famine, and fascism.* And, furthermore: *How can we as educators connect with and start conversations between these kinds of organizations, our classrooms, and communities?* This starts with learning about who is already attempting these conversations and how to support their attempts. Additionally, think about shifting classroom communities in order to encourage collaboration rather than competition and focus lessons on fostering and developing skills of community collaboration rooted in mutual aid and interdependence. School and community gardens can be a site of such teaching and learning. *How might we learn to teach from the Black Lives Matter at Schools resources? Or, what might it be like to teach or be a student in Rojava and what might we learn about other movements in different places that help us locally to resist the antidemocratic violence often coupled with nation-state identities?*
- **Engage in supporting the diverse approaches to taking up resistance and healing from the power/knowledge curriculum of an Anthropocentric Worldview rooted in Individualism & Human Supremacy and, in solidarity, show respect for epistemologies that differ from the current dominant discourses of Western industrial culture.** Support the ways in which diverse forms of resistance work to challenge value-hierarchized dualisms that perpetuate value-hierarchized thinking. For example, explore the ways in which local groups in your community are fighting against past and present acts of colonization, both in the US and internationally. Imagine how educators might teach lessons that challenge and question progress rooted in hyper-consumerism and global market ideology. For example, have students explore barter and trade in efforts to make explicit that economic systems do not need to be rooted in capitalism. Have students identify non-monetized activities that exist in the community. Additionally, have students explore the speciesist, racial, and gendered dimensions of non-monetized caring work and how that work together with commitments to antiracism and feminism upholds and strengthens communities and democratic possibilities bioregionally.

In conclusion, above all, and in addition to the attempts to disrupt institutionalized Western industrial culture that is perpetuated through and within educational spaces—we urge that we all do what we can as teachers, teacher educators, education researchers,

curriculum and pedagogy scholars, or simply just concerned citizens addressing what can be done given a global crisis. Following what we have shared as possible starting points for what we call ecocritical pedagogies we summarize all such efforts into a necessary commitment to the daily effort of turning our attention to: learning from the local and building critical friendships with other humans and non-human animals, engaging with adversaries, and sharing stories of hope and resilience while critiquing local and international relations of domination and hierarchies in favor of bioregional Earth Democracies. We believe that it is through diverse, international coalitions in solidarity of this work that we will be able to meaningfully change. In such volatile, authoritarian times with the dangers and implications of climate change imminent, it is important that critical educators challenge dominant perceptions of what currently constitutes schooling, education, and knowledge to collectively imagine with open hearts and minds what is possible when we commit to learning to be members of bioregional Earth Democracies that value diversity and the interdependencies of our living worlds and work together to shift what we learn and practice in schools toward a practice of rethinking, reconnecting, and revitalizing democratically, locally, and in support of living systems.

The field of environmental education is complex and complicated. It is inherently cross-disciplinary, drawing from across the sciences, social sciences, and humanities as it invites us to explore, meditate on, and critique our knowing and being in the world. Environmental education is reflective of who we are, where we are in space and time, what our relationships are (and are not) with the worlds that we live within, and what we hope for in the future. The inescapable complexity and ever-changing nature of environmental education cannot be framed in a snapshot but instead necessitates our consideration of the histories, philosophies, beliefs, and understandings of the land that we live with and in. In doing so, environmental education invites us to engage in learning and acting that recognizes and celebrates diversity across human and more-than-human worlds and is motivated by social and ecological justice.

This chapter¹ explores the dynamic cartography of environmental education, both historically and contemporarily, and brings together its varied landscapes of curriculum, pedagogy, and discourse. Further, it illustrates these intersecting and interacting approaches in practice and invites us to immerse ourselves in both the calm and turbulent waters of environmental education.

Conceptions and currents of environmental education

*environ*²—to circle, encompass, from French *en-* in + *viron* circle

educate—bring up, from Latin *educere* bring out, lead forth

In order to guide our navigation of environmental education's ever-changing terrain, it can be helpful to use Sauvé's (2005) currents of environmental education.³ Sauvé identifies 15 categories that capture the theoretical and practical commonalities of the diversity of environmental education programs and approaches. She distinguishes between those currents with longer histories in teaching and learning and those more contemporary currents that we see guiding our environmental curriculum and instruction (see Table 1). While distinctions are made, it is important to highlight that we can identify threads of both older and newer currents in present environmental education (Sauvé, 2005).

Sauvé's discussion of the currents of environmental education, and their respective pedagogies and practices, are inherently shaped by our conceptual foundations of environment—how do we recognize environment? She outlines six conceptions of environment that underpin the curriculum and pedagogy of environmental educators (Sauvé, 1996). *Environment as nature* valorizes a pure natural space that is separate from humans. It is through immersion within these spaces that we are able to learn about and appreciate how nature works and how we might live in respectful relation to it. In contrast, *environment as resource* views the natural world as providing us with the raw materials to support our desired quality of life. Recognizing that some resources are in limited supply and being depleted, we are encouraged to be mindful of and manage our usage of natural resources that the environment presents us with. Next, and related, the *environment as a problem* focuses on the biophysical environment and threats to its health (e.g., pollution, deforestation, etc.). Here, we are tasked with devising strategies to solve these problems and mitigate their negative impact on us. *Environment as a place to live* situates us within the local environment inclusive of biophysical, socio-cultural, historical, political, and technological features. We recognize it as *our* environment; it is a space that we dwell within and are

¹This chapter was written while the author was living and learning on and with the traditional lands of many nations including the Mississaugas of the Credit, the Anishnabeg, the Chippewa, the Haudensaunee, and the Wendat peoples. Toronto is now home to many First Nations, Inuit, and Métis peoples.

²Etymological roots of key terms were located using the *Oxford Dictionary of English Etymology* and the *Online Etymology Dictionary*.

³Please see Sauvé's (2005) article, "Currents in Environmental Education: Mapping a Complex and Evolving Pedagogical Field," for her in depth tracing of environmental education's envisioning and practices.

Table 1 Sauvé's 15 currents of environmental education.

<i>Currents with longer histories</i>	<i>Currents that are more contemporary</i>
Naturalist current	Holistic current
Conservationist/resourceist current	Bioregionalist current
Problem solving current	Praxic current
Systemic current	Socially critical current
Scientific current	Feminist current
Humanist/mesological current	Ethnographic current
Value-centered current	Eco-education current
	Sustainable development/sustainability current

Adapted from Sauvé (2005).

members of. *Environment as biosphere* embraces the environment, and the earth, as an interdependent and conscious system. Extending from theories including James Lovelock's Gaia Theory, acknowledgment of the environment as such a system necessitates living and being together in ways that respect and care for all things. Finally, *environment as a community project* invites us to get involved and participate in our communities and environment. This conception brings together socially critical activism and political action as it calls for our informed citizenry (Sauvé, 1996). Taken together, these six conceptions of environment loosely capture the significant epistemological identities that ground environmental education curriculum and pedagogy and act as the upwellings at the source of Sauvé's currents of environmental education.

Below, and with these conceptions in mind, I have explored the mixing of traditional and more contemporary currents of environmental education to highlight the connections and interactions that present themselves in their pooling and the related motivations, curricula, and pedagogies that flow out of these mixings. It is important to note that while I have brought together the following currents, these are certainly not the only groupings possible, indeed we might explore poolings of many different currents and their resulting ebbs and flows.

The naturalist, value-centered, and holistic currents

nature—essential qualities or innate character, from Latin *nasci* to be born

value—worth, price, from Latin *valere* be strong, be well

holism—unification of separate parts, from Greek *holos* whole

The *naturalist current* is, for most people, what comes to mind first when they think of environmental education. It is motivated by our connections with the natural world and includes cognitive, experiential, affective, spiritual, and artistic understandings and connections to nature (Sauvé, 2005). Historically, we can locate the headwaters of this current in the Romantic movement and in the theorizing of Jean-Jacques Rousseau. In *Émile*, Rousseau asserted that the child must learn from experiencing and exploring their environment. These statements were later supported by Louis Agassiz, a Swiss-American biologist and educator who contended that students should learn directly from nature. Specific to the early years, Friedrich Fröbel, the creator of the first kindergarten, and Maria Montessori similarly emphasized the importance of nature being integrated into curriculum and instruction to support children's cognitive and natural development. We might even locate the early springs of the naturalist current in Ancient Greece, when scholars and learners attended Plato's Academy and gathered in discussion and debate in its gardens and grounds.

In the 19th century, what we now identify as *environmental education* was included within *nature study*. Jackman's (1891) *Nature Study for Common Schools* encouraged taking school children outside to learn across the disciplines through first-hand explorations of the natural world. Key within nature study was bringing the learner into intimate and emotional contact with nature; it was an integrated and place-based educational movement. Nature study was prevalent in early childhood education well into the 1920s until the strain of the Great Depression in the 1930s and its eventual and complete overshadowing by the rise and rigor of science education in the 1940s and 1950s and nature study's lack of congruence with the increasing rigidity of school structure and organization (Disinger, 1983/2001).

Naturalist currents resurfaced again as nature and earth-focused approaches to environmental education were taken up in the 1970s (see, for example, van Matre, 1990). Here, and along with time spent in the natural world, we see the early flows of value-centered and holistic currents of environmental education. *Value-centered currents* carry with them environmental values, morals, or ethics (see, for example, Brennan and Lo, 2010) that are recognized to underpin positive environmental actions and relationships with and in the natural world. One philosophy relevant, albeit controversially, to environmental education is deep ecology. Founded by the late Arne Naess, a Norwegian philosopher, and inspired by the writings of environmental activists of the 1960s, deep ecology asserts the inherent value of all living things on earth regardless of their direct worth to humans (Naess, 1973). It highlights the complex interconnectedness of all members of the earth's ecosystems and maintains that these relations necessitate our respect and care for all of our human and more-than-human neighbors. As such, deep ecology takes up a holistic view and understands that the health and wellbeing of individuals in ecosystems depends on the health and wellbeing of ALL

members of that system (Naess, 1973). It follows that the *holistic current* extends and applies this understanding of connectedness as it embraces the inherent socio-environmental relationships with those experienced realities of the learner, including the sensory, cognitive, affective, and esthetic experiences of the environment. Knowing and being is embodied and guided by subject-object relations: physical experience with and in environment is central (Sauvé, 2005).

Nature preschools and forest kindergartens

We can see the naturalist, value-centered, and holistic currents flowing through and converging in many environmental education approaches, programs, and practices. Significant to these currents are the contributions of Richard Louv and his tireless advocacy on the importance of nature in children's lives (Louv, 2005). Drawing on trends in childhood health and development (i.e., increasing obesity, attention disorders, and mental health concerns), Louv (2005) maintains that children are suffering the effects of *nature-deficit disorder* and their disconnect from the natural world. His remedy is for children to return to nature, to freely and immersively explore and relocate for themselves the sense of awe and wonder in the natural world, its inhabitants, and its phenomena. These acts can not only improve and support the health and wellbeing of children but also of adults accompanying those explorations and of environments through children's growing understandings and connections to natural places and spaces and resultant positive environmental attitudes and actions. Nature preschools and forest kindergartens take up Louv's prescription as they afford young children the opportunity to be regularly immersed in the natural world's curriculum. Extending from the early kindergartens and learning environments of Fröebel and Montessori and inspired by Steiner's Waldorf kindergartens and the Reggio Emilia approach, nature preschools and forest kindergartens are common through Europe and are increasingly found in Asia and North America (see, for example, Sobel, 2016, 2020; Elliot, 2019; Elliot and Krusekopf, 2017). While context may vary, what remains consistent across these learning environments is their active situation of curriculum and pedagogy in children's observations, actions, emotions, questions, and conversations as they explore the environment around them. The natural world provides the context for learning and also a second teacher. Nature preschools and forest kindergartens, while presenting learners and educators with risky play situations, can in fact foster safety awareness and skills development while building a community of learners. The teachable moments and sensory pauses of awe and wonder abound in the dynamic outdoor curricular spaces, situating knowledge and nurturing connections to place and histories (Elliot, 2019).

The conservationist/resourcist, problem-solving, scientific, and sustainability currents

conserve—preserve safely, from Latin *conservare*, from *com* with, together + *servare* keep watch, maintain

resource—means of supplying a want or deficiency, from Latin *resurgere* rise again

problem—difficult question, from Greek *problema*, from *pro-* forward + *ballein* to throw

solve—loosen, unbind, from Latin *solvere* unfasten, free, pay, from *se-* + *leu* to loosen, divide, cut apart

science—knowledge, especially of a technical kind, from Latin *scire* to know, *scindere* to cut, divide, from Greek *skhizein* to split

sustain—hold the course of, keep in being, from Latin *sustinere*, *sub-* up from below + *tenere* to hold

develop—unfold, lay open, from Old French *desveloper*, from *des-* undo + *-voloper* wrap up

We can locate the headwaters of the *conservationist/resourcist current*, as well as the problem solving, scientific, and sustainability currents of environmental education, in the beginning of the 20th century when much of the western world was embroiled in war or suffering the economic impacts of those years of conflict as well as extended periods of drought. The *conservation education* movement of the early 1900s focused on the preservation of both quantity and quality of natural resources for human use; these included forests, soils, water, animals, minerals, oils, and plants, all of which provided directly or indirectly products to meet human needs and wants. From a position of conservation, natural resources and the natural world were to be managed and used wisely so that they could be preserved for use by future generations. The conservation movement originated largely from government interests and resulted in legislation, enforcement, and finally science-focused education. Related, and later in the 20th century, *resource-use education*, the social studies partner of conservation education, centered on geography and economics where conservation education focused on natural history and resource management education presented a professional relationship between humans and the environment through teaching of topics including soil conservation, water management, urban and regional planning, and landscape design. Overall, conservation education focused on resources rather than education more broadly (Disinger, 1983/2001).

Beginning in the 1950s and gaining momentum in the mid to late 1960s, with shifting social and political climates and an increasing awareness of environmental issues (e.g., pesticide use, water and air pollution) motivated in part by the contributions of environmental writers including Rachel Carson and Aldo Leopold, there was a significant renewal of interest in bringing environmental well-being and justice to the forefront of discourses. This interest catalyzed conversations on the place of environmental teaching and learning and the situation of environmental education as a separate discipline (Disinger, 1983/2001). This also brought conservation education into the *problem solving current* in environmental education. Stapp's 1969 definition of environmental education attempted to extend previous thinking about environmental education into future directions that addressed and acted upon environmental concerns and issues. He identified environmental education as being "aimed at producing a citizenry that is knowledgeable concerning the biophysical environment and its associated problems, aware of how to help solve these problems, and motivated to work toward their solution" (Stapp, 1969/2001, p. 34). Objectives within

environmental education included an “understanding that man (*sic*) is an inseparable part of a system, consisting of man, culture, and the biophysical environment, and that man has the ability to alter [those] relationships” (Stapp, 1969/2001, p. 34), an appreciation of the natural and man-made biophysical environment and its place in society, an understanding of biophysical environmental problems “confronting man” and how these problems can be solved by responsible citizens and governments, and a concern for environmental quality that motivates citizens to participate in environmental problem solving (Stapp, 1969/2001). Stapp’s early definition of environmental education recognizes that humans are part of the environment but in its wording and priorities, clearly views environmental education, and the environment itself, through an anthropocentric lens mirroring the sentiments shared by Aristotle over 1000 years earlier, “nature has made all things specifically for the sake of man.” This lens magnifies the importance of “man” while failing to capture in its field of view the very relationships that humans have with the environment that cause the problems themselves.

Concurrent, and in complement, to the problem-solving currents of environmental education flow the waters of the *scientific current*. In K-12 education, environmental education has typically been siled within science education where it can form the hook with which to pique the interest of learners in thinking about and doing science (see, for example, Gough, 2002; Sauvé, 2005). Science education in the 20th century has, for the most part, been motivated by the need for countries to become and remain competitive through advancements in innovation (Wals et al., 2014). This is clear in the acceleration of science and technology, and in turn privileging of mathematics and science in schooling, following World War II and into the 1960s as the United States battled with the former USSR for victory in the space race. As such, science education’s goals focused on developing scientific content knowledge and science process skills in learners. In environmental education and in order to solve environmental issues and problems, science was understood to be the means and the method of finding solutions and within K-12 education, we can see the flow of the scientific current through environmental education curriculum and instruction. For example, while Ontario secondary schools used to offer elective grade 10 and 12 Environmental Science courses in the 1980s and early 1990s, environmental education is now in theory taken up across all subject areas (Ontario Ministry of Education, 2017) but in practice this tends to be heavily weighted in science. We similarly see this persistence of the scientific current in both focus and method of studies on K-12 environmental education. Ardoin et al. (2018) review and analysis of research on environmental education and K-12 student outcomes highlights this, indicating that 68% of studies measured knowledge outcomes and 78% of studies followed a quasi-experimental design using pre-post measures or multiple groups (Ardoin et al., 2018). Development of scientific knowledge and the use of the scientific method strongly feature in environmental education curriculum and research.

What is fundamentally problematic in the relationship of science to environmental education is the disconnect between foundational worldviews. Whereas science is underpinned by a strong empiricist and positivist tradition through which knowledge is obtained and truth realized through an objective and rational scientific method and that dominates formal education, environmental education instead presents multiple and alternative frameworks for knowing and being. These worldviews necessarily consider social, ethical, ecological, epistemological, and ontological questions and issues. Sustainability education, or education for sustainable development, has been proposed as a bridge crossing both science and environmental education waters (Holdsworth et al., 2012).

The *sustainable development/sustainability current* emerged in the 1980s and gained strength through the 1990s and into the 2000s. This current’s flow can be traced back to the meetings and resultant reports of the United Nations and UNESCO in the 1970s, 80s, and 90s, namely the Belgrade Charter (UNESCO/UNEP, 1975), the Tbilisi Report (UNESCO/UNEP, 1977), the Brundtland Report (United Nations, 1987), and Agenda 21 (United Nations, 1992). Agenda 21 was shared following the 1992 United Nations Conference on Environment and Development (UNCED) and its 40 chapters addressed the pressing environmental issues (e.g., loss of biological diversity; population growth, poverty, and inequality; climate change) and the critical importance of looking ahead and preparing for future environmental challenges. Chapter 36 of Agenda 21—Education, Training, and Public Awareness—carried forward Brundtland’s earlier assertion that education can enable students with the environmental and ethical knowledge, skills, values, attitudes, and behaviors to support sustainable development (Palmer, 1998). The declaration of the United Nations Decade of Education for Sustainable Development (2005–2014) further honed the global focus in environmental education on sustainability.

EcoSchools programs

One group of educational programs that the conservationist/resourcist, problem-solving, scientific, and sustainable development currents flow through are the Eco-Schools programs. In response to the United Nations’ calls to action outlined above, Eco-Schools began in 1994 with a few participating schools in Europe and has since expanded to 59,000 schools across 68 countries (Eco-Schools, n.d.). Many projects take up the 3R’s of reduce, reuse, and recycle in their focus including waste reduction, energy and water conservation, and school ground greening as schools aim for bronze, silver, gold, or platinum levels of certification (Eco-Schools Canada, 2019). EcoSchools programs and projects can provide learners with unique opportunities to learn about the environment and environmental issues and take positive actions to improve their environment. It must be noted though that many of these projects and school-based initiatives (e.g., lights out in classrooms, using both sides of paper) may in fact be motivated by economic benefit. Also local and place-specific knowledge and relationships may be lost in a prescriptive and hierarchical uptake of sustainability and sustainable development (see, for example, Jickling and Wals, 2008).

The systemic, humanist/mesological, bioregional, ethnographic, and eco-education currents

system—organized or connected group of objects, from Greek *systema* organized whole, *syn-* together + *-sta-* to stand, make or be firm

human—of or belonging to man, from Latin *humanus* of man, also philanthropic, kind, gentle, polite

meso—middle, from Greek *mesos* middle, in the middle

-logy—a speaking, discourse, from Greek *logos* word, speech, statement

bio—from Greek *bios* life

region—kingdom, realm, land, province, from Latin *regere* to direct, guide, rule

ethnography—description and classification of the races of mankind, from Greek *ethnos* nations + *-graphia* study

ecology—the study of relations of living things to their environments, from Greek *oikos* house, dwelling place + *-logia* study of

In contrast to the often divisive and disconnected nature and effects of the conservationist/resourceist, problem solving, scientific, and sustainability currents, the collective of the systemic, humanist/mesological, bioregional, ethnographic, and eco-education currents tend to embrace a more connected and reciprocal approach that extends from earlier naturalist, value-centered, and holistic currents. The waters of the *systemic current* present a “big picture” of environment and environmental education that is inclusive of biophysical and social elements and their interrelations. It draws on human ecology, it invites enlightened decision-making, and its locus of attention is the ecosystem (Sauvé, 2005). Here we can see a bringing together of the holistic and problem-solving currents: understandings of natural systems and situations deeply guide decision making.

Following the systemic current’s connectedness, the *humanist/mesological current* flows through the intersection and exchange of nature and culture: it circulates at the middle of biophysical, historical, cultural, political, economic, and emotional aspects of the environment (Sauvé, 2005). Rather than separate and untouched, this current recognizes the impressions of human movement left in nature and identifies environments to be landscapes shaped by these relations. This includes city landscapes and garden landscapes to name but a few. Like earlier currents, the humanist/mesological embraces a cognitive approach but also sensory, affective, and creative engagements with and in environments and understandings gained through these experiences allow for our enriched environmental relations and interventions (Sauvé, 2005).

The *bioregional current* flows alongside the humanist/mesological current but runs deeper, circulating and taking up the natural and cultural elements of place. In contrast to sustainable development, which has grown out of international conferences and considerations, the bioregionalist current’s early waters have been at the grassroots level and encouraged by the ideas and actions of both philosophers and practitioners who emphasized the need to dwell thoughtfully and responsibly in our life place for the benefit of all systems of life (MacGregor, 2005). It carries with it the geography and the consciousness of a place and in its flow, often across political boundaries, shares the wisdom of how to live with and in that place. Bioregions typically feature a common identity in human membership and residents often live in ways that embrace and celebrate the natural communities and lands of the region. Within the bioregional current, place is defined by its natural and social systems and is grounded in its natural and cultural histories. Members of bioregions *dwell* in those places: they hold a sense of belonging and participate in reciprocal and caring relationships with its ecological and social environments (Sauvé, 2005). An example is shared by MacGregor (2005) in their discussion of the bioregional curriculum created with Cascadia, a unique bioregion in the Pacific Northwest of North America encompassing British Columbia, Washington, Oregon, and Idaho, as the focus of learning.

The *ethnographic current* focuses the opening of environmental knowledge and relationships to ways of knowing and being beyond the Western scientific worldview. This emphasis on the cultural dimension of environmental kinship recognizes and respects the wisdom of places and the narratives, traditions, and practices that teach those understandings. Looking to Indigenous worldviews, we see the shared centrality of both content and process in knowledge and the inextricable connectedness of all beings with each other and with the land. This is, for example, taken up in the theory of Tsawalk, the Nuuchah-nulth perspective that everything is one, and comes from their creation stories and is realized in their traditional knowledge and wisdom (Atleo, 2004). Recognizing that everything is connected necessitates our caring for others and the land as we care for ourselves. Given the holistic, situated, and deep knowledge and process in indigenous ways of knowing, as noted by Cajete and Pueblo (2010), traditional indigenous education “is an environmental education process that can have a profound meaning for the kind of modern education requirement required to face the challenges of living in the world of the 21st century” (p. 1128). When taken up in environmental education, we see the active embodiment of holistic indigenous philosophies as learners engage in ceremony, visioning, storytelling, observing, experiencing, reflecting, and creating (Simpson, 2002). Elders are acknowledged as keepers and teachers of tradition and culture and are consulted as experts in all stages of programming and indigenous languages allow for deeper connections to wisdom. Land is central to traditional knowledge and wisdom and opportunities for learners to connect to the land emotionally, spiritually, physically, and intellectually are inherent in teaching and learning. Finally, space for resistance and ongoing decolonization are essential for learners to critically examine dominant worldviews and reclaim and renew cultural knowledge and traditions (Simpson, 2002).

While we recognize different cultural ways of knowing and being, this does not necessitate rejecting other knowledge and wisdom. Instead, we might take up Two-Eyed Seeing, “learning to see from one eye with the *strengths* of Indigenous knowledges and ways of knowing, and from the other eye with the *strengths* of Western knowledges and ways of knowing, and using both these eyes together, for the benefit of all” (Bartlett et al., 2012, p. 335). This embrace of multiple perspectives at once validates non-Western knowledge and being while also allowing for the complement of different perspectives and interdependence of all beings to deepen and enhance our learning and living. An exceptional text that brings together Indigenous wisdom with western science in

its reminder to us and celebration of the gift of our relationship with the living world is Robin Wall Kimmerer's *Braiding Sweetgrass: Indigenous Wisdom, Scientific Knowledge, and the Teachings of Plants* (2013).

The *eco-education current* focuses on the development of the self within the context of the environment. It realizes the etymological genealogy of education itself as a bringing forth and leading out of the self through and with our relationship with the environment. This interaction is foundational to our eco-formation and our eco-ontogenesis. Eco-formation is the process by which the individual develops as they are reciprocally shaped and transformed by the environments that they relate with; it is our being-in-the-world (Cottureau, 1999 as cited in Sauvé, 2005). Similarly, eco-ontogenesis centralizes the place of environmental relations with the growth of the individual and identifies the unique periods of development of this relationship through childhood, youth, and adulthood (Berryman, 2003 as cited in Sauvé, 2005). If we recognize one of the goals of education itself to be active and informed membership in communities, societies, and environments, then it follows that environmental education and the nurturing of a respectful and meaningful relationship with the more-than-human world is an important part of all learners' curriculum.

Community mapping

Community mapping is a pedagogical tool that allows learners and educators to engage in environmental learning and teaching through their active and reflective explorations of place. Broadly, mapwork is means of making sense and meaning of the world and maps created are themselves representations of our knowledge, understandings, experiences, and histories of different spaces. Community maps can take many forms and the form that the map takes depends on the mapmakers. I collaborated with a British Columbian grade four teacher and her class on a community mapping project of their local provincial park, Sandy Beach.⁴ Our project was guided by place-based education, a situated and experiential approach to teaching and learning that evolves from and examines the particularities of a place, celebrates the diversity of places, informs how we live and interact within the world on many levels—socially, culturally, politically, ecologically—and highlights the interconnectedness and interplay of these systems in its pedagogy (Smith, 2007, 2012). Through its curriculum and instruction, it brings together place with the self and the community (Woodhouse and Knapp, 2000). Our three-month project focused on the local history of the park, its natural history and ecosystems, Indigenous peoples' relationships with the land, and the children's own personal connections to and stories of place. Over the duration of the project, we visited the park on three field trips, enjoyed visits to the school from the local museum director and the school's First Nations liaison teacher, and engaged in various mapping activities once or twice per week through the collaboration. As we focused our gaze on Sandy Beach, we explored and reflected on the park through our active mapwork of photography, storytelling, illustrations, poetry, and sculpture.

Through their mapwork, the students' understandings of and connections to the park and to the local environment grew and deepened (Jagger, 2013, 2016). They recognized the park's biodiversity, the adaptive nature and relationships of its plants and animals, and the rhythms of its ecosystems. The students' deep knowing of nature was supported by community mapping and nurtured through their observing, situated knowing, identifying, restoring, and transforming (Jagger, 2013). The students' attitudes and feelings about the park and the land similarly developed; they expressed care for humans and the more-than-human world, noting that the park was a safe and caring space for everyone. They also recognized the relationships between humans and the environments that we live with and in, how our actions can negatively impact other members of our environmental community, and how they might support the environment's health. Personal histories and narratives also featured significantly in the students' mapwork and in their discussions; they felt a connection to the park and recognized that they were a part of the park ecosystem (Jagger, 2016).

The praxic, socially critical, and feminist currents

praxis—practice, exercise, from Greek *praxis* doing, action

social—living with others, from Latin *socius* companion, ally, follower

critical—censorious, inclined to find fault, from Greek *kritikos* able to make judgments

feminism—qualities of females, from Latin *femina* woman, female, she who suckles

The *praxic current* in environmental education is one of action and reflection. Unlike those currents that call first for the development of knowledge and skills ahead of action, the praxic current recursively engages the learner in reflection on action and in action guided by reflection (Sauvé, 2005). This dialogic process mirrors that of participatory action research, the purpose of which is to change or improve the quality of the lives and experiences of people, communities, and environments through its practical and collaborative research process. In the praxic current's flow through environmental education, we see learners and educators affecting change through their acting and learning through, by, and for the environment. As it upsets the linearity of knowledge and skills preceding action, the praxic current and its shaping by action research also shifts the dominant relationship of educator as expert and student as novice in teaching and learning to one of equality as both educator and student are recognized as co-learners bringing unique perspectives, ideas, and questions to their explorations.

⁴All identifying names of people and places have been anonymized to protect the identity of study participants.

The *social critical current* is fed by the headwaters of critical theory, a philosophical approach that assesses and critiques society and culture to reveal power structures in place that oppress and upset those structures to emancipate individuals, communities, societies, and cultures (Sauvé, 2005). Education is reflective of those forces in effect in society that actively empower and disempower. Critical pedagogy supports learners in their reading of the world, their recognition of the social, political, and economic contradictions that create oppression and perpetuate the status quo, and their transformation and liberation of the oppressed in actions against dominant realities (Freire, 1970/2000). In environmental education, the social critical current considers and analyzes the social structures, roles, and practices that create and perpetuate environmental situations and crises. These include the explicit and implicit intentions, positions, values, and actions of those responsible for decision making. It also identifies who holds power, and who does not, and how those imbalances impact our interactions and influences on the environment. For environmental educators, the social critical current invites their active and ongoing reflection on their beliefs and practices and holds them accountable to address power imbalances to ensure that their planned curriculum is deeply and authentically realized (Sauvé, 2005).

Gruenewald (2003) proposes a critical pedagogy of place as he brings together “the best of both worlds” in his analysis and synthesis of critical pedagogy and place-based education. The resulting proposition of a critical pedagogy of place asserts the goals of decolonization and reinhabitation, aims that at once retain the emphases of critical pedagogy’s challenge of the taken for granted and oppressive assumptions and actions in education and culture and place-based education’s rich embeddedness of active citizens in their local biophysical, social, historical, economic, and political environments. In a critical pedagogy of place, decolonization and reinhabitation are reciprocal and simultaneous moves. Decolonization recognizes and upsets the persistent patterns of dominant and oppressive ideas and ideologies in schooling and culture through an unlearning of that curriculum and a re-educating that embraces socially and ecologically just and transformative ways of knowing and being. Noted by Bowers (2001), our active decolonization must not only reject dominant oppressions and reimagine ways of knowing and being, but it must also include a recovery and renewal of traditional and harmonious cultural ways of living and being. Here is where we see the reciprocal and supporting action of reinhabitation. Within this, we are challenged to “identify, recover, and create material spaces and places that teach us how to live well in our total environment” (p. 9)—to reinhabit the land. This involves living well in place, *dwelling*, knowing our place, and maintaining a reciprocal relationship with that place. Together, the complimentary and inextricably linked acts of decolonization and reinhabitation can allow for the critical exploration of the shared space of education, culture, and environment (Gruenewald, 2003). In practice, we can see this in a critical environmental education that recognizes the environment as socially situated, expands conceptions and perceptions of environment, identifies positionalities, is guided by learners’ lived experiences, critically reviews curriculum, diversifies the environmental canon, embraces people of color as environmental role models, and appreciates shared goals (Stapleton, 2020).

The *feminist current*, like the social critical current, brings with it change in viewpoints and values. It focuses on those so often unspoken power relationships that privilege one member over all others. Historically, feminism has critiqued and deconstructed the binary of man/woman but this has been extended to look more broadly at power relations, uncovering and actively upsetting oppressions based on gender, race, class, ability, and orientation (Barrett, 2005). The dominance of women is mirrored in the dominance of the environment, of Mother Earth. As such, the feminist current, and its distributaries of ecofeminism and new material feminism to name but a few, further considers the concepts of nature and environment, opening them as well to review of relations of domination and control and in their deconstruction, blur the perceived boundaries of human/nature and create “a single mutually interdependent interactive, mutually influential, and mutually interdependent post-human nature” (Merchant, 2016, p. 161, as cited in Gough and Whitehouse, 2018, p. 343). This is particularly relevant when we consider connecting children with nature in a wild and untouched state, nature outside of the city and away from human influence; this is an impossible task as human relations are now inherent in nature’s being, in postnature and post-human-nature (Gough and Whitehouse, 2018). Like some earlier and persistent currents and in opposition to rational approaches to environmental concerns, the feminist current seeks to nurture and care for others—both human and more-than-human beings and to (re)establish respectful and reciprocal relationships that are enhanced by the realization of the individual’s strengths and talents (Sauvé, 2005).

School garden and nature-based participatory research with children

The confluence of praxis, social critical, and feminist currents is clear in participatory research with children and youth in environmental education. The United Nations Convention of the Rights of the Child (UNCRC) declared that “in all actions concerning children ... the best interests of the child shall be a primary consideration” (United Nations, 1989, Article 3) and that children should be allowed to express their own views and be heard in discussions that affect them (United Nations, 1989, Article 12). This has direct implications for education and in turn for curriculum, pedagogy, and research in environmental education. Children are active, creative, and social change agents who are experts into their own lives; they offer to unique perspectives and ideas that cannot be realized through their typical role of *researched* rather than *researcher* (Barratt Hacking et al., 2012; Mayall, 2000, 2002).

Over the past 10 years, I have collaborated with elementary school students in participatory environmental education research: I partnered with a group of grade six students to explore their school garden experience and understandings and am currently working a longitudinal study of ecological citizenship and children’s participation in school garden and nearby nature-based curriculum and research. In these studies, students participated in all stages of research from brainstorming research questions to devising data collection and analysis methods to sharing findings with peers and their community. The students’ research questions and topics ranged from grade 1 explorations of plants, worms, and what people like, eat, and want to grow in the school garden to deeper

studies of birds, frogs, adaptations of plants and animals, community composition, and differences in neighbourhoods' environments and green spaces in grade 2 to increasingly complex research by grade 3 students on caring for their school garden, helpful and harmful relationships with nature, how living and nonliving things work together, waste and keeping our world healthy, local and natural history of the community, plant and animal growth, and activism and action to help the school garden and environment. The students created tools and conducted data collection including surveys, interviews, observations, and experiments and analyzed their findings by looking for commonalities and patterns, analogous to thematic coding (see, for example, [Jagger and Hayward, 2019](#)). At the end of their studies, students shared their findings with the peers and the community through posters, plays, comic books, and presentations, to name but a few.

What has been clear throughout these research engagements with children in environmental education is their growing understanding of and connection to the environment and the more-than-human world. Students' direct and active engagement with the environment in their school garden and nearby nature shaped their thinking about the land and its inherent relations ([Jagger and Hayward, in press](#)). Along with their developing knowledge about the plants, animals, and ecosystems, students increasingly recognized the blurred intersections of nature and culture, social injustices and their realization in environments, and the strength of their voices and actions to make positive changes in their communities ([Hayward and Jagger, 2019](#)). The complement of the students' active participation in environmental curriculum and research has supported their developing and enacted ecological citizenship.

Moving forward with and in the currents

Along with many other things, both uplifting and inspiring and negative and discouraging, what the very recent past has shown us is that our thinking and in turn our actions have deep and extensive impacts on those in our immediate communities and in our broader systems. We have seen the rapid and devastating spread of a deadly virus around the world. We have witnessed brutal violence on plain citizens at the hands of authority. We have come together in support of each other and have diverged in seeking out our individual interests at the expense of others. All of these actions, whether looking out for self-interest or caring for the community, have an effect on others now and in the future. And this extends to the more than human world. In restricting our movements and staying home to reduce the spread of COVID-19, we have seen changes in environments. With the lockdown of cities and towns in Spring 2020, air quality improved in many areas as emissions reduced and concentration of air pollutants decreased ([Kumari and Toshniwal, 2020](#)). Wildlife seems to be returning, or becoming more prevalent, in urban areas (see, for example, [Lowrie, 2020](#)). And, while the lagoons and canals of Venice are not actually hosting dolphins, reduced boat traffic has cleared its waters ([Daly, 2020](#)). What is clear is our inherent and inextricable connection to and influence on those who we share environments with.

Environmental education and its currents are similarly related. Each current flows into the others, creating deep and rich curricular confluences. The currents shape each other and respond to the movements of seemingly parallel or perpendicular streams and to obstructions in their paths. [Sauvé's \(2005\)](#) currents of environmental education are listed linearly and organized as those with longer traditions and those more recently emerged. However, as she notes, all of the currents coexist and present themselves to us as inspirations for engagement in environmental curriculum and pedagogy ([Sauvé, 2005](#)). The shared histories, philosophies, and movements of the currents detailed in this chapter and the confluences that I have explored highlight their relatedness. As we continue to be inspired and guided by the currents in our work as educators and as citizens, it is important to observe in our thinking and acting their presence, as roaring torrents or as trickling brooks, and reflect these relations in our planned and lived curriculum and pedagogy. Nature kindergartens, EcoSchools projects, community mapping, and participatory research on school gardens and nearby nature are inherently connected: their motivations, histories, understandings, and outcomes overlap, build, and grow from each other.

While we meditate on the movement of the currents, it is also critical, now more than ever, that we respect and allow for the pooling and circulating of environmental education's waters on and with the land. As educators and as learners, we must open up environmental education to read, reflect, and respond to the stories and relationships which it inherently is shaped by and shapes. Here, our curriculum and pedagogy must actively and consistently critique dominant worldviews and problematize and break down those power inequities that privilege based on social position, identity, and contexts. A good place to start is with the foundations of our environmental education practice and our conceptions of environment. While [Sauvé's \(1996\)](#) six conceptions of environment—environment as nature, resource, problem, place to live, biosphere, and community project—provide us with a launching point into the currents of environmental education, we must also consider the environment as a space of interacting and conflicting personal, community, and cultural histories and relations. For example, many environmental justice activists see the environment as not a space to be protected but rather as something to be protected from ([Allen et al., 2007](#)). Environmental racism's (not always) quiet persistence is clear here where marginalized communities historically and continue to be disproportionately impacted by environmental hazards including toxic waste, unsafe drinking water, polluted air, and pesticide use (see, for example, [Bullard, 1990](#); [Mohai et al., 2009](#)). All too often environmental education takes up a romantic view of children learning and being in nature, following approaches that embrace the values and ideals of western and white middle class while overlooking or ignoring the perspectives of people of color and the tensions and injustices that marginalized individuals, communities, societies, and cultures lived, and continue to live, with ([Nxumalo and Ross, 2019](#); [Stapleton, 2020](#)). Noted by [Gough \(2013\)](#) in her reasoning for developing a feminist perspective in environmental education, it is essential "to recognize the complexity of human roles and

relationships with respect to environments and that there are multiple subjectivities and multiple ways of knowing and interacting with environments" (p. 376).

Orr (1992) poignantly penned that "all education is environmental education. By what is included or excluded, emphasized or ignored, students learn that they are a part of or apart from the natural world" (p. 90). The environment is at once nature, a resource, a problem to be solved, a place to live, the biosphere, a community project, and a historical, cultural, and political space and environmental education should recognize these conceptions, their inherent connections, and their shaping of us, our communities, and the land that we live with and in. Perhaps we ought to dig down into the roots of ecology, *oikos*, and focus on our shared environment or home and caring for all of our relations of home. Through caring for and empowering all, we can work toward a world in which environmental health and well-being and environmental justice are symbiotic and concomitant.

Introduction

Intersectional analysis is increasingly deployed as a way of examining the complex unjust configurations of the social. Critical studies of elite schools have similar concerns but have, largely, not consciously deployed intersectional analysis. On first glance, this seems strange. But perhaps it is not as strange as it first appears. Intersectional analysis focusses on variations of subjugation. Critical analysis of elite schools focusses on variations of domination—on the dominant not the dominated. Another reason that intersectional analysis has been overtly absent from studies of elite schools is that these two fields of inquiry have very different roots. The former has its roots in Black feminism. Studying those who subjugate has not been part of its remit. The latter's roots are largely in variations of class analysis. While, feminist analysis has a long-standing presence in studies of elite schools, Black feminism has very little presence (see however, [Horvat and Antonio, 1999](#)). Nonetheless, even despite this apparent lack of connection, we suggest that many recent studies of elite schools have a broad intersectional sensibility—even though it is unacknowledged.

Our overall purpose here is dredge this sensibility to the surface by reading studies of elite schools through an evolving intersectional lens. We begin with a short history of intersectionality, identify the central debates about it, clarify some of its different expressions and note the current conundrums that it faces. We then focus on those studies of elite schools which can be read as adopting weaker forms of intersectional analysis, followed by a focus on those that can be read as adopting stronger versions. We conclude by acknowledging some of the dangers of what we have done.

Intersectional analysis: conceptual clarifications

What is intersectionality? Is it a “a theory, metaphor, paradigm,” and what are “its precise methodological attributes” ([Davis, 2008](#))? Given its contested history, rapid and wide-ranging spread and its “ambiguity and open-endedness” ([Davis, 2008](#), p. 67), it is difficult to pin down. Nonetheless, for our purposes, some initial statements are necessary. Our focus is on intersectional analysis not intersectionality more broadly.

Broadly, intersectional analysis arises from certain feminist dissatisfaction with the ways in which women's inequality and oppression are understood in everyday society—particularly by white liberal feminists. It seeks to move beyond any notion that society consists of distinct silos of power (e.g., of race, gender, class, sexuality, ability, nationality, religion and age)—only one of which is primary. In other words, it challenges approaches to analysis that are one-dimensional—those that focus on a single axis of power. These are regarded as essentialist, reductionist and universalizing.

Again, very broadly, intersectional analysis tries to address such limitations by stressing the manner in which multiple inequalities and oppressions occur together—but not just in an additive way. Hence it mobilizes such language as intersecting, overlapping, criss-crossing and cross-roads. Its metaphors include “interlocking oppressions,” “mutually-reinforcing oppressions” and the “matrix of domination.” As a slogan it is a short hand acknowledgment that women differ and that subordinated groups of women reject the suppression of their uniqueness, concerns and preferences. In its strongest iteration it looks at, “The joint operations of major systems of oppression that form a complex social structure of inequality” ([Collins and Bilge, 2016](#), p. 70).

That said, there are many narratives and debates about what intersectional analysis is, and stands for, who and where it comes from, how it evolved and spread and where it might go next. As most commentators demonstrate, there is nothing singular or linear about any such matters. Intersectional analysis is complex, heterogeneous and dynamic (Jibrin and Salem, 2015; Tomlinson, 2013). It defies closure.

Further, intersectionality is nomadic. Its roots, primarily in USA black feminism in 1970s and 80s, continue to be recognized as foundational (particularly via the work of the Combahee River Collective (1977), Collins (1989) and (Crenshaw (1989, 2004)). Crenshaw actually coined the term and initially focused on the links between race and gender. Some who preceded her were concerned about “triple oppression”—classism, sexism and racism (Gordon, 2016). Intersectionality spread rapidly in the 2000s and came to include a wider range of identities, issues and causes. Further it has taken many routes across institutions, sectors and nations and into a wide range of disciplines with diverse theoretical and methodological paradigms. Consequently, it mutated—as do most traveling theories (Davis, 2008).

Cho et al. (2013) describe the intersectionality literature arising from these routes as “centrifugal.” As such they alert us to the manner in which it is both altered by the protocols of its new locations and, in turn, alters them. It informs, and is informed by, other fields and locations and thus enriches scholarship, overall, as it travels.

But Cho, Crenshaw and McCall also point out that much, maybe most, intersectional scholarship is “centripetal.” It brings together *inter- and trans-disciplinary* scholarship (women’s/gender/feminist studies and women-of-color feminism, as well as queer, critical race and post-colonial studies). This scholarship refuses to be beholden to, and disciplined by, the disciplines or by the codes of a specific field. In drawing into its ambit, a variety of theories and methods, and in bringing together unorthodox lines of inquiry, intersectionality is unconventional, insurgent and disorderly. It insists on being, and remaining, a space of disruption and transformation.

This insistence can be juxtaposed against attempts to unify and mandate the terrain of intersectionality scholarship—particularly with regard to who are its legitimate practitioners and subjects. For example, American Black women and Black feminism have been central to the development of intersectional analysis. Thus, questions arise about whether Black women should be its only practitioners and whether it should, or can, be deployed to address expressions of social injustice other than race and gender (Drayton, 2014). The “whitening of intersectionality” (Bilge, 2013) is a concern here. But so too is its Westernism given that women from the Global South are often excluded from USA’s Black Feminism. To address this issue, Grabe and Else-Quest (2012) argue for “Trans-national intersectionality [which] places importance on the intersections among gender, ethnicity, sexuality, economic exploitation, and other social hierarchies in the context of empire building or imperialist policies characterized by historical and emergent global capitalism” (p. 159).

Intersectional analysis has attracted many debates and criticisms. But given that the concept has been deployed in the various ways, noted above, critiques of it may well be focusing on certain iterations and not others. Further, criticisms will depend on where the critic is coming from, politically and geographically, and when they were written. We comment on some such criticism here in order to make clear both the variations of intersectionality that we distance ourselves from and those we identify with. In the process we note some of the dilemmas faced by those who seek to deploy intersectional analysis.

We distance ourselves from three widely adopted, but less widely criticized, approaches. The first involves *diminishment*. These approaches are evident, for example, in various policy and management documents and popular texts. Therein intersectionality has become a slogan or buzzword—a catch-all, catch-phrase. These texts co-opt and domesticate the concept thereby trivializing and depoliticizing it—treating it as akin to domesticated notions of difference, diversity and inclusivity, for example. As Gordon (2016) observes “intersectionality can signal a kind of pluralism, in which identities are represented as equivalents on a field of competing interest groups” (p. 347). Such incorporation also raises praxis questions. For example, how readily can intersectionality be deployed in political practice? And how is solidarity to be expressed when multiple axes of oppression and injustice are invoked?

The *formulaic* is the second problematic approach. Here the main effort goes into multi-dimensional mapping, plotting or graphing. As the number of axes expands the utility of the metaphors diminishes. Indeed, the individual can become the ultimate subject if all possible axes are deployed. Further, such exercises tend to offer portrayals that lack dynamism and thus a sense of history and context. Without history and context, it becomes difficult to decide on what, and how many, axes to cover and in what combinations. What is it necessary to focus on and on what grounds? What can, legitimately, be implied, or left out, and why?

Micro-analytic approaches also require critical attention. They usually make identities, or identity categories, a central starting point and adopt an additive approach. Ironically, even despite the emphasis on mutual constitution these identities can appear to remain primary. This is why intersectionality has been criticized as a refined version of identity politics. A further concern, we have, is that the primary focus is on injurious experiences. This is a problem if such experiences are divorced from such broader structural processes as capitalism, nationalism, colonialism and imperialism and their associated regimes of power.

Some of intersectionality’s key proponents have argued, for quite a while, that it has reached a crucial turning point. For example, Cho et al. (2013) call for a “broadened field of vision” that encompasses both the centrifugal and the centripetal. Importantly, they argue,

If intersectionality is an analytic disposition, a way of thinking about and conducting analyses, then what makes an analysis intersectional is not its use of the term “intersectionality,” nor its being situated in a familiar genealogy, nor its drawing on lists of standard citations. Rather, what makes an analysis intersectional—whatever terms it deploys, whatever its iteration, whatever its field or discipline—is its adoption of an intersectional way of thinking about the problem of sameness and difference and its relation to power. This framing—conceiving of categories not as distinct but as always

permeated by other categories, fluid and changing, always in the process of creating and being created by dynamics of power—emphasizes what intersectionality does rather than what intersectionality is.

Cho et al. (2013, p. 795).

Intersectionality, they say, must expand “to include the integration of projects that bring crucial theoretical, methodological, and substantive resources to studies of intersectionality” (2013, p. 795). Collins and Bilge (2016) make similar calls. They observe that intersectionality is “at a crossroads,” call for a more “expansive view” and invite more innovative approaches. Collins and Bilge insist that intersectional analysis must address “social inequality, power, relationality, social context and complexity” (pp. 25–30). And they also insist that intersectionality must be about “praxis.” They offer compelling empirical examples of such analysis.

Critical studies of elite schools

After a period of relative lack of attention paid to elites and their schooling, the study of elite schools has gained new momentum over the past 15 years (cf Kenway and Koh, 2015). For example, the growing body of work in North America (e.g., Khan, 2011; Weis et al., 2014) illustrates the various ways in which elite schools undertake contemporary class-making. Similarly, in Europe, there has been an increased focus on students at elite schools (e.g., Draelants and Darcy-Koechlin, 2011) and elite schools (e.g., Brooks and Waters, 2015; Courtois, 2018) to understand more fully their various strategies for reproducing power and privilege. And, as various overviews (e.g., Barrera et al., 2021), and edited collections (e.g., van Zanten et al., 2015; Maxwell and Aggleton, 2017; Koh and Kenway, 2016), show English language studies of elite schools now include many studies of elite schools in the global South.

This body of work has addressed a wide range of topics, including the historical rise of elite schools across the world, the diverse experiences of students, and the various outcomes of elite schooling. While class remains the dominant conceptual focus in tackling these topics, researchers have given increased attention to intersections. Much more than their predecessors, these (mostly ethnographic) more recent studies have explored the intersections of class primarily with femininities and masculinities (e.g., Charles, 2014; Chase, 2008; Proctor, 2011) and, to a lesser extent, race and ethnicity (e.g., Ayling, 2019; Gaztambide-Fernández, 2009; Kuriloff and Reichert, 2003; Warikoo, 2016). While such researchers don’t tend to name what they do as intersectional analysis they nonetheless conduct a variation of it. And, their variations can be judged as having varying degrees of analytical purchase according to the criteria we noted above.

Approaches with a restricted purchase

Diminishment

Scholars’ increased calls for the need to explore the complicated intersections of different categories of identities in the study of elite education often fall into the trap of trying to address everything without addressing anything very deeply. One of the dangers of such efforts is to curtail a theorization of that which is being investigated. For example, Noblit (2007), in his call for emphasizing intersectionality in rethinking class urges us to take the “weight off” class in considering the various way in which class structures people’s everyday experiences. He argues that class must be “re-accomplished through other forms of difference” (p. 343). The question then becomes: How far can class be reconstituted through other forms of difference before our analysis and discussion are not really about social class anymore? Noblit’s rightly identifies the need to explore the complicated intersections of different categories of identity; however, his analysis falls short in acknowledging fully the distinct nature of class. In trying to cover everything, Noblit ends up covering nothing in depth. Class, in particular, gets ultimately lost in the kind of intersectional analysis of class that he proposes.

Another (related) danger of attempting to address everything is that it inhibits theorization of that which is being studied. For example, “privilege” has become a dominant concept in the wave of recent research (Kenway and Koh, 2015). Emerging from anti-racist feminist thought (McIntosh, 1988) the concept of privilege recognizes the various forms of advantage and the status and the power that are attached to them. Although originally developed to encourage intersectional analysis, the dominant ways of thinking about privilege are often limited to identifying advantages and status. In the study of elite education, this concept, more often than not, becomes another way of focusing on class instead of facilitating intersectional analysis. For the most part, privilege has become a limiting and vague concept in this body of work. Despite efforts to reconceptualize privilege to make it more theoretically useful for the study of elites and elite education (e.g., Howard, 2008), the prominent uses of this concept has led more to description than theorization.

Formulaic

Too often, intersectionality is addressed in additive or formulaic ways that make it empty of meaning. One such way has been to explore the intersectionality of social and cultural identifications without drawing on the necessary conceptual resources to do such analysis at more than a surface level. These explorations remain incomplete and oftentimes spurious in their failure to fully attend to the complexities involved in these intersections.

In their critique of Jack's (2019) research on the experiences of low-income, students of color at an elite university, Gaztambide-Fernández and Angod (2019) draw attention to how Jack, similar to other researchers who study elite education, bypasses the significance of race and, in so doing, ends up primarily focusing on class. They argue, "While he does 'mention' race ... Jack avoids any analysis of whiteness or how white supremacy shapes whether, how, and which students get to develop a 'sense of belonging' within an elite academic space" (p. 724). Although we contend that Jack does more than simply mention race in his work, Gaztambide-Fernández and Angod make a critical point about the necessity of using conceptual resources, such as whiteness, white supremacy, and colonialism, to analyze the intersections between, in this case, eliteness, class, and race. Consequently, they conclude, Jack fails to offer a thorough theorization of these intersections. However, Gaztambide-Fernández and Angod's overall argument that "eliteness approximates whiteness" limits the very theorization of intersections that they claim is needed in the works of Jack and other scholars studying elite education. The concept of whiteness has more limited purchase when engaging in intersectional analysis of elite schooling in contexts where whiteness is not as useful or relevant as a conceptual resource as it is in the global North.

Micro-analytic

In the surge of studies on elite schooling, researchers tend to utilize conventional ethnographic approaches. These ethnographic studies have yielded profound insights about the educational structures, practices, experiences, meanings and processes of elite schooling. However, researchers tend to stretch the limits of ethnography beyond its capacity by studying sites rather than larger flows and fields, bounded groups rather than boundaries and practices rather than processes. Studies of elite schools usually focus on the institutions themselves—their curricula and practice, the entangled linkages between secondary and tertiary provision, and how students experience such elite spaces. Although this body of work has offered valuable insights into the everyday experiences of those within these elite institutions, there is limited purchase in exploring how these experiences reflect something larger than what is happening within these institutions being studied.

Further, many recent studies in elite schools are nation bound and consequently subscribe to "methodological nationalism"—the misguided assumption that emphasizes the cultural and political form of the nation state in analysis of the modern world (Kenway and Koh, 2015). Because of the various forces of globalization, as Koh and Kenway (2012) remind us, "it must be acknowledged that a proper understanding of elite schools cannot be gleaned from within the site [or indeed the state] alone" (p. 337). However, most researchers avoid connecting what is happening within the particular site under study to the changing nation state within which their site is located and larger global shifts.

A further issue arises with regard to micro-analytic studies conducted in the global South. This relates to the intersection between theory and location. Many such studies draw on theoretical resources developed in the global North. This raises questions about methodological Westernism and traveling theory—about whether Southern theory (Connell, 2007) better assists us to understand elite schooling in the global South. A micro-analytical focus seems to preclude such questions.

Approaches with greatest purchase

Clearly, then, some versions of intersectional analysis have had only limited purchase for studies of elite schools. This is particularly so when they focus excessively on identity and/or the micro at the expense of the systemic and structural, and/or when they subscribe to methodological nationalism and methodological Westernism.

However, and in contrast, Collins and Bilge's core concerns, identified above, do speak to some existing streams of research on elite schools. Certainly, many studies of elite schools address social inequality and power. While "relationality, social context and complexity" and praxis are less well addressed they are not absent.

Praxis

Growing strand of research on elite schools is concerned about *praxis*—it is action-oriented. In recent collection, for example, Swallow and Spikes (2021) bring together a diverse group of practitioners and scholars researching, theorizing, and enacting social justice education in elite schools. Drawing on multiple perspectives and experiences, researchers and practitioners explore various ways that privileged students can be educated to encourage them to take active steps toward reducing and disrupting oppression. But some caveats are in order. If such action-oriented approaches seek to put into practice the liberal-progressive mantra that elite schools preach, rather than challenging their "disavowals" (Kenway and Lazarus, 2017), they will be weak. More broadly, to the extent that such research, either explicitly or implicitly, subscribes to weaker versions of intersectionality its *praxis* will also be weak. Stronger versions of intersectionality have more to offer but these are under-developed.

Most examples of stronger versions focus on action-oriented work conducted outside the context of elite schools. But they have important implications for such schools. Stoudt et al. (2012), for example, use critical participatory action research (CPAR) to integrate the "enactments of privilege" in youth experiences of educational, criminal, and health (in)justice. This participatory method enabled the research team and those within the community to challenge injustices, connect empirically and politically the privileged and the disadvantaged, and contest, reframe, and transform privilege. More than just a method to generate data, they used CPAR to engage in an intersectional analysis for studying, problematizing, questioning, analyzing, and challenging power dynamics. Benjamin et al. (2021) also use CPAR and intersectional feminist approaches in an effort to facilitate a process that opens

possibilities for Jewish teen girls with racial and class privilege involved in a community-based organization to develop an emerging critical consciousness.

Relationality

We have argued elsewhere (Howard and Kenway, 2015), that many studies of elite schools offer a rather restricted reading of *relationality*. Relationships within classes (class, race, gender) often take precedence over relationships between classes. Such intra-class analysis involves a form of analytical enclosure.

In contrast, a strong intersectional sensibility requires, and also complicates, inter-class analysis. It leads, for instance, to the sort of study conducted by Madrid in Brazil wherein the relationships between ruling class men and the various women in their lives are, he found, filtered through class and gender. Madrid (2013) observes,

ruling class men related differently to ruling and working class women. In the domestic sphere, the relationship between men and mothers and wives is different from the one they have with *nanas*. This dichotomy is extended to sexuality, where there are different practices depending on whether they are relating to a similar or a different woman. However, the relation with ruling class women also varies. For instance ruling class mothers have a different role in their sons' masculinity construction depending on which figures of motherhood they are associated with (pp. 222–223).

A relational focus also draws attention to the extractive economy of elite schools in national education systems—to the manner in which they wrest financial and reputational resources away from those systems and schools that serve the children of the “lower” classes. For example, Boden et al. (2020) illustrate how taxation and charity law and the British state's political apparatuses have, over extended time, led to major tax breaks for elite and other private schools and to the depletion of financial resources for government schools that serve the bulk of the population.

Social contexts

Obviously, attention to *social contexts* takes studies beyond the micro analytic approaches noted above. It invites considerations of what contexts matter, how and why. In our view, to study elite schools *in situ* is to explore the intersections between history and geography, temporality and locality, and to identify the ways in which these play out in elite schools and education systems. Dunwill's (2021) study illustrates this point. Her methodology involved four intersecting “angles of scrutiny”—“globalization, European integration, socialist heritage and tradition.” Together, these help her to explain “the multidimensional and fundamental changes that have occurred during the last 30 years of post-communist transformation” (Dunwill, 2021, p. 42) and their implications for new elite formation and new elite schools in post-communist Poland. In another study, Howard and Maxwell (2021) identify the push and pull of the transnational and national constantly at work in cosmopolitan practices that are a central part of the class-making project of elite schools. Through such practices, elite schools facilitate the process of conferring cosmopolitan status, which their students can recognize, name and draw on as needed, as they work to reproduce and extend their elite positions.

Complexity

An insistence on *complexity* involves addressing the structural and systemic and their everyday expressions. Either can be a starting point but one without the other is insufficient. An intersectional approach at the systemic level requires looking at and beyond the state, at and beyond the West, at and beyond the present. While it points to various entanglements it also disentangles.

We adopt this approach in *Class Choreographies* as we unravel the links between elite schools located in seven former British colonies, the former British empire, and globalization. As we say,

Colonialism, capitalism and Christianity are the mighty Cs of empire. They are entwined entities sharing an uneasy coexistence ... Tightly braided together like strands of the ropes used on early merchant ships, the expansion of the British Empire cannot be disentangled from forces of capitalism. Capitalist expansion is threaded with labour (in the form of slaves, convicts and indentured labourers) and materials traded as commodities, exported from and imported to the colonies; while colonial missions of conquest cannot be unravelled from colonial “civilizing” (through Christianity) missions.

Kenway et al. (2018, p. 49).

We show how this history is currently expressed in the routine life of these schools as they attempt to connect to contemporary asymmetrical globalization while also responding to the requirements of the neo/post-colonial states in which they operate.

Complexity requires a methodology that can give it due attention. One such methodology is employed by Prosser (2014) who develops a “constellation” approach by “arranging ideas and themes in a non-deterministic fashion.” In his study of an elite school in Argentina he looks at the “local and global determinants” of the school's status including the manner in which “the history of global capitalism coincides with Argentine nationalism, British ‘informal’ imperialism and Presbyterian educationalism” (Prosser, 2014). Another methodology that addresses complexity is “multi sited global ethnography” as developed by Kenway (2015),

Kenway et al. (2018). Howard (2008) has also employed this approach in a study of the ways in which students, attending elite schools, located in six countries across the world, were cultivated into particular subjects through practices and meanings attached to their global citizenship education programs. Howard identifies how these programs are adopted to align the schools in global terms as part of their larger strategy of making and remaking elites. Although elite schools position themselves as increasingly global, Howard finds that national interests remain vital in their class-making strategies (e.g., Howard et al., 2020).

Concluding thoughts

There are dangers to what we have done here. We have shown that studies of elite schools have been deploying versions of intersectional analysis without necessarily naming it as such. We suggested that the reasons include their different roots and starting points, even though, as indicated, strong intersectional studies of elite schools have certainly included post-colonial thinking. Nonetheless certain absences in studies of elite schools remain—black feminism particularly. In this respect, to claim that studies of elite schools have an implicit intersectional sensibility runs the risk of implicitly “whitening” the concept. In contrast, consciously naming it might foreground Black feminism. This could lead to important new lines of inquiry about elite schools around the globe particularly if colonialism and capitalism are analyzed from a Black feminist perspective and if the concerns of girls and women from the global South are addressed. Epstein’s (2014) *Race-ing class ladies: lineages of privilege in an elite South African school* exemplifies the possibilities here. It shows how the “legacy of colonizer and colonized,” and the racialized politics of South Africa’s past and present, intersect with notions of femininity to “whiten” black girls at an elite girls’ school (p. 244).

That said, a benefit of claiming intersectionality, in the manner we have, is that weaker and stronger versions have become evident. Thus, those who undertake future intersectional analysis of such schools can get a sense of preferable starting points—specifically according to the criteria laid down by Collins and Bilge (2016).

On the other hand, if intersectional analysis has reached a turning point, if it is to broaden its field of vision, if it is to integrate fresh foci and resources, then it might include, within its remit, studies of elite educational institutions and elites. Undoubtedly such foci would be new as would some of the analytical directions and resources we have identified.

Introduction

Systems of education are a predicate of U.S. democracy and essential to the development of informed and thoughtfully engaged civic and political citizens (Kridel, 2010). In terms of participatory democracy, where democratic actors are positioned to take a strong role in shaping the political future, education plays a prefigurative role where students can begin to engage in democratic processes although they are unable to vote. Westheimer and Kahne (1998, p. 11, 13) note that “a democracy cannot function meaningfully without informed and critical analysis of issues and social problems”. This requires “that our youngest citizens regain a sense of civic commitment and the belief that they have the capacity to work with others to improve society”.

We take issue with the notion that students need to regain a sense of civic commitment as if prior generations had this felt obligation and present generations do not. We also take issue with the confining definitions of citizenship which denies political agency according to a hierarchical, nationalistic order. Instead, we view a radical, embodied form of participatory democracy as a pathway for political engagement and increased awareness of social justice issues as always already present in the lives of minoritized youth and undocumented democratic participants. In short, by actively participating in democratic mechanisms of change, students can begin to see themselves for what they already are: powerful voices and embodied actors in a social web of political possibility.

Historically, the role of education within the US has been to prepare students to engage in democratic processes in the future once they reach voting age. (Biesta, 2016, pp. 123–124) notes that education along these lines functions as “education for democracy,” which resists the active promotion of democracy in schools and instead focuses on the knowledge, skills, and disposition to engage in democracy in the future. Often individualistic in its approach, education for democracy actively works against the collectivism and activism needed for political change in a democracy. An alternative to an individualist, preparatory paradigm in democratic education is “education through democracy” (Biesta, 2016, pp. 124–125) which emphasizes Hannah Arendt’s (2013) political conception of democratic subjectivity—*vita activa*—to “bring something new into the world”. In this case, students are not asked to wait to deliberate or participate in the political process and teachers are not asked to simply prepare students for future democratic engagement. Students are asked to take up the difficult task of actively participating in “democratic life itself” and teachers are asked to reflect on the “democratic quality” of the learning environment to support students’ direct experience with democratic processes. We wish to highlight the various obstacles to student participation in the political process that multiple models of democracy maintain when radical participation is ignored through sociolegal, external, and internal exclusion.

First, the competitive representative model of democracy is exclusionary for students who are not yet of voting age. This model relies on the judgment of professional politicians who are not obligated to consider K12 students as constituents. As a result, before these students reach voting age, their criticisms, opinions, and suggestions for policy-making and political action can be easily disregarded based on ageist notions of political legitimacy. This model effectively removes students as authorized bearers of political responsibility as the primary mechanism for political accountability—the vote—is not within their reach. Second, the competitive representation model links socioeconomic advantage (e.g., the ability to donate to political organizations, exclusionary tactics based on race, class, gender, sexuality, and ability) with political advantage (i.e., privileged access to democratic mechanisms) and thereby reproduces political inequality (Landemore, 2017). For this reason, as youth are pushed to the margins due to their class-, race-, sex-, gender-, and/or ability-position they take on a minoritized status in terms of economic power and social power which directly impedes their political power. It is easy to imagine how these sociolegal obstacles will remain in place until (1) students’ socioeconomic status is fundamentally altered through the development of anti-classist, anti-racist, anti-sexist, pro-queer, and anti-ableist political practices and (2) politically-engaged youth are recognized as legitimate political actors both socially and legally. Here, we reach a political bind for minoritized youth’s political power: they are unable to equally participate in the competitive representative model until elected representatives alter the broader sociopolitical and socioeconomic reality to allow for their engagement. Due to the structure of the US Constitution, we will indeed be left with some degree of competitive representation as a necessary mechanism of our national democratic machinery. Indeed, alternative models of democracy are not in competition with one another. Any advocacy on our part for participatory forms of democratic engagement should not be read as a desire

to supplant other forms that democratic action might take. Here, we wish to emphasize that voting and formal political representation—although one necessary and principal branch of our political efforts—is not the only means through which voters and non-voters, and students, in particular, can have a voice.

Unlike the competitive representative model that asks voters to merely elect representatives and move on with their lives, we recognize that ongoing deliberation and participation is a necessary catalyst for social justice. At this point, we arrive at two main, somewhat overlapping alternatives: deliberative democracy and participatory democracy. The deliberative model (Cohen, 1989; Fishkin, 1991; Gutmann and Thompson, 2009; Habermas, 2015) focuses on reasonableness, consensus building, and public discourse as the primary means through which publics are involved in the democratic process. One of the main criticisms of the deliberative model is what Biesta (2009, p. 105) calls “entry conditions for participation in deliberation”. He notes that it “is not so much a question about who should be included,” rather, “it is first and foremost a question about who is able to participate effectively in deliberation”. Iris Marion Young (2002, p. 53, 55) points to two forms of exclusion: external and internal. External forms of exclusion are those that “keep some individuals or groups out of the fora of debate or processes of decision-making, or which allow some individuals or groups dominative control over what happens in them”. In schools, external forms of exclusion are outlined in behavior and conduct policies which administrators and teachers are granted the authority to enforce. In fact, the hierarchical nature of the educational structure grants less authority to keep some individuals and groups out of the decision-making process as workers are placed further down the organizational structure. Students are generally placed at the bottom of this hierarchy with limited democratic control over what happens in their learning environment. Students’ physical bodies are highly regulated by authority figures under constant threat of disciplinary consequences. Internal forms of exclusion operate when “the terms of discourse make assumptions some do not share, the interaction privileges specific styles of expression, [or] the participation of some people is dismissed as out of order”.

As we highlight in subsequent sections, internal forms of exclusion in schools align with the demand to adhere to performative Whiteness, which is evaluated under Western, Eurocentric rubrics that (re)order the student body under threat of academic and social failure. These demands to perform Whiteness across curricular content and pedagogical strategies are modeled and evaluated by authorities as a means to exclude students who are affectively misaligned with the performative rubrics of Western idealism. While these forms of external and internal exclusion are bound to an exclusionary, Otherizing past and present, it is important to note that youth participation in democratic deliberation is externally and internally denied through ageist notions of youths’ lack of knowledge, reasonableness, rationality, or a legitimate legal claim to politics in general. Although other countries across the globe are experiencing anti-democratic, authoritarian shifts (Morgan, 2021) we focus here on the United States and its ongoing anti-democratic sentiment. As we will cover in detail in subsequent sections, these forms of ageist exclusion function as a more widely accepted stand-in for racist, sexist, anti-queer, and ableist exclusionary tactics by dominant sociopolitical groups and educational authorities.

Interrupting the democratic ideal

In the quest to (re)produce ideal democratic citizens, US education systems enact immense violence against those deemed non-ideal and therefore out of order. As these systems trudge forward in stagnant practices, the diversity in student body makeups, and quite literally that of individual student bodies, exist in direct opposition to schooling’s routine ordering of the body along the lines of race, gender, sexuality, ability, and class. These myriad students challenge and obstruct violent practices through embodiments, identities, and ways of being that exemplify resistance, challenging cultural flattening and erasure. Emerging alongside the civil rights movement of the 1960s, participatory democracy is an amalgamation of complicated ideas imbued by a radical reformulation of traditional democratic approaches (Bobo et al., 2004). With its three primary themes: (1) grassroots organizing and people’s involvement in decision making, (2) minimizing hierarchies and professionalization throughout social change organizations, and (3) direct action to dismantle structures of injustice, participatory democracy provides a robust framework for understanding, legitimizing, and arousing public voices. Emphasizing collective public participation, participatory democracy frames calls of involvement as an obligation of joint citizenship (Bobo et al., 2004). Although conflicting histories credit the origins of participatory democracy to either Ella Baker or Tom Hayden, Baker, by way of personal embodiment, highlights transformative democratic possibilities, value in lived knowledge, and a countering of Whiteness’ normative assumptions. The activism of the Student Nonviolent Coordinating Committee (SNCC) (Ransby, 2003), a student-led independent organization of the 1960s attributed to Ella Baker and her philosophy of social collectives, offers a prime example of participatory democracy in action. Additionally, Baker’s role in forming and implementing participatory democracy contextually anchors embodiment itself as a liberatory practice alongside the ongoing struggles against heteropatriarchy, racism, sexism, anti-queerness, and Whiteness (Bobo et al., 2004).

By asking people to make decisions about issues that impact their lives, participatory democracy rejects self-governance traditions and replaces obstacles of socially embedded hegemonies (Kridel, 2010). A participatory democracy model—constructed to counter indifference, fear, and tolerance of autonomy while shaping collective goals—requires (re)imagined, inclusive foundations restructured through unconventional explorations and actions (Bobo et al., 2004). Because participatory democracy is but a small part of an overall strategy of empowerment, it requires full engagement with dialog wherein individuals listen attentively with a preparedness to experience change and speak with hopes of being heard (Kridel, 2010). This preparedness is not only an ability to experience personal change in the future, to be heard at some point, or to practice one’s distant engagement with the social or political environment but an affective orientation toward present work on one’s self, one’s expression, and one’s environment.

Various interventions across discourses and within US education systems require re-signifying to symbolize attempts by those who have been historically and regularly suppressed by unyielding discriminatory binaries and associated expectations meant to reify ongoing subjugation. To this point, the goal of participatory democracy is not to idealize the possibility of a “fully functioning person [who] arrives at participatory democracy,” but rather to recognize a journey made possible through curriculum (Kridel, 2010), “where one practices a pedagogy of the question[and] one teaches and one learns [with] one another” (Freire, 1993, pp. 18–20). Showcasing these intellectual pursuits, however, are not merely for that of an omnipotent Truth, but rather for a “status of truth and the economic and political role it plays” in determining one’s place in society (Foucault and Faubion, 2000, p. 132).

A shift toward the democratization of schooling is made possible by way of democratic discussions and actions anchored in queries of academic promises and canons of life—what it means to have and live a good life and how to do so, how the pursuit of a fulfilling life is never-ending, how this pursuit might contribute to equity, happiness, and love, and what ongoing solidarity with others, both locally and globally makes possible (Kridel, 2010). It is not the emancipation of “truth from every system of power” this endeavor seeks, but the detachment of “power for truth from the forms of hegemony, social, economic, and cultural, within which it operates at the present time” (Foucault and Faubion, 2000, p. 133). To serve the public good through participatory democracy, systems of education must intervene in hegemonic issues of heteropatriarchy, the prominence of oppression originating in theocratic orientations, and the prevalence of “middle-class values” embedded throughout (null) curricular assumptions of race, gender, and sexuality (Hobbel and Chapman, 2009).

Interventions against such stagnant ideologies require a re-envisioning of participation, possibility, and democracy that signify an excess to its signifier and an ongoing politics to subvert and obstruct hegemonic discourses of an ideal and constructs of normalcy (Kridel, 2010). To “challenge the normalization of the White worldview of knowledge while affirming the personal and family histories of dark people,” a re-envisioning via collective participation by those so often excluded from discourses of democracy—social outliers whose very existence challenges Truth narratives of embodied worth and presumed normalcy is needed (Love, 2019, p. 136). Individuals who sit in opposition to hegemonic heterosexuality, gender conformity, Whiteness, and class norms resist through their very survival as outliers. These subjects embody resistance to traditional historical domination and, as this work proposes, are categorically queer;

not because of their sexual practice, identity, or performance but because they, as well as other young and poor folks of color, operate in the world as queer subjects: the targets of racial normalizing projects intent on pathologizing them across the dimensions of race, class, gender, and sexuality, simultaneously making them into deviants while normalizing their degradation and marginalization until it becomes.

(Cohen, 1997)

Reconstructing notions of queerness as a radical collective of social outliers proposes a politics wherein one’s comrades are determined by their relation to power rather than by their embodiment, identity, or privilege (Cohen, 1997). The radical potential of queer politics as transformative recognizes knowledge as embodied (Love, 2019) and residing with those who, because of their marginalized social positions, manifest spaces in direct opposition to dominant hegemonic exclusionary norms (Cohen, 1997).

By way of a queer participatory democracy to challenge socially constructed assumptions of normalcy and liberation, dreaming of impossible freedoms is made possible. This orientation toward freedom, known as “Freedom Dreams,” are, as Love (2019, p. 101) explains, “critical and imaginative dreams of a collective resistance”. Imagining a collective countering to White hegemony, as radical and impossible as it might seem, is the first step in direct action against oppressions. Baker’s practice of participatory democracy models freedom dreaming in her quest for collective action, offering a liberatory and inclusive democracy made up of social outliers (Ransby, 2003, p. 310). Valuing critical, cultural, embodied ways of knowing as knowledge, which has long been excluded from traditional systems of US education, asks educators to (re)evaluate whose knowledge is of most worth, whose truths are told, and what places exist for authentic learning and examination of one’s own experiences?

One such reprieve, *homeplace*, coined and defined by bell hooks (1989, p. 384), is

the construction of a safe place where black people could affirm one another and by so doing heal many of the wounds inflicted by racist domination. We could not learn to love or respect ourselves in the culture of white supremacy, on the outside; it was there on the inside, in that ‘homeplace,’ most often created and kept by black women, that we had the opportunity to grow and develop, to nurture our spirits.

By way of a queer participatory democracy and freedom dreaming, a collective might create space, critique, tear down, and “rebuild a school system that loves all children and sees school as children’s homeplaces” (Love, 2019, p. 102).

Amending hooks’ description of homeplace, Johnson (2016, p. 46) offers a new idea of *homespace*, wherein “the spaces we create are not necessarily sited in a particular “place” but rather made or assembled through our interactions within it”. Applying home-space and freedom dreaming to existing exclusionary entities, such as schools, offers an opportunity to democratically challenge educational Whiteness through engagement with radically queer participation, wherein the journey of education becomes a liberatory conduit.

Schooling and democratic citizenship

Distinct from education itself, schooling is imbued with heteropatriarchal, classist, ableist, white-supremacist democratic foundations, wherein those categorized as non-ideal by Eurocentric rubrics affectively experience schooling as a site of immense violence (Love, 2019; Vaught, 2014; Wozolek, 2020). Contemporary understandings of K-12 education cite inclusion, individuality, and opportunity, while infrastructure, curricula, and educators reinforce discriminatory abuses. Hence, schooling negates obligations to acknowledge, adjust, and atone for historical inequities enacted upon oppressed populations. Instead, marginalized students are hyper-visible, over-policed, devalued, and gaslighted when attempting to negotiate the ever-present violence of educational endeavors—experiences inscribed by heteropatriarchal, ableist, and classist histories of exclusion and abuse. Along these lines, schooling is closely connected to the ways in which students learn to become engaged in democracy. An important portion of non-ideal categorization of democratic participants is not only how students are taught to participate democratically but also who has worth in the democratic process.

Perhaps the most powerful area of critique for educational researchers is citizenship education. When educators take up questions about what it means to be a citizen, how one becomes a citizen, or what constitutes citizenship more generally, they may look to legalist frameworks which are the most common orientation in state social studies standards (Stuteville and Johnson, 2016). In other words, who is or is not a citizen depends on their legal status that confirms a claim of participatory power through the state. Instead, the term citizen might be up for critical redefinition outside the confines of legal definition in the classroom. Markowitz (2015) argues that the current citizenship scheme at the federal level has profound negative consequences for immigrants, the communities they live in, and a democratic society more broadly. For example, absent a state-affirmed citizenship status, the government has no obligation to ensure their “fair and humane treatment” (p. 911). In addition, undocumented people are emotionally, socially, economically, and politically deprived as a result of their legal status. In order to combat the ongoing marginalization of undocumented people in the US, he claims there is a justified legal argument to be made that individual states can confer the rights of states citizenship without the support of the federal government. This would accomplish a movement of these people from a “semipermanent underclass” (p. 915) to the democratic participants they already are whether this status is conferred legally or not.

The role that education can play in this critique of citizenship is to deemphasize the legalistic definition of the term and, instead, foreground the knowledge, skills, values, and dispositions (Johnson and Morris, 2010) which constitute a citizen extralegally. Accordingly, this necessitates a critique of the participatory citizen in a participatory democracy. Westheimer and Kahne (2004) outline three categories of what good citizens are and what they do. At one end of the spectrum, there is the personally responsible citizen who “acts responsibly in [their] community” by doing things like obeying laws and volunteering their time (p. 241). These people understand their role as one defined by their compassionate, honest, and responsible character. At the other end of the spectrum is the justice-oriented citizen which is often “least commonly pursued” (p. 242). These people work to address systemic injustices in their community and emphasize the root causes of the social justice problems (pp. 242–243). Between these two orientations is the participatory citizen—those who are active participants in the existing structures of democracy. By participating in “collective, community-based efforts” (p. 242) to make their communities better, participatory citizens need knowledge of how communities are organized and governmental agencies function (p. 240).

For more than a century, schooling has negotiated the task of bringing together groups of students from unequal social classes and introducing them to these democratic processes and conceptions of citizenship. Through its original purpose, the assimilation of Others into “the superior culture—White, Anglo-Saxon American” (Ladson-Billings, 2018, p. 6), schooling actively eradicates “the socially inferior ... [by preserving] ‘old stock’ American values” (Winfield, 2007, p. 100). Vaught (2014, p. 153) defines educational institutions as state apparatuses that maintain White liberal initiatives, perpetuating “systemic racialized, gendered, sexualized and aged power relations” while (re)producing ideological models of democracy. One such ideological model is related to character education and an emphasis on good citizenship and personal responsibility predicated on obedience to law and order. Along these lines, those who are considered socially inferior in terms of character are those who undermine these “old stock” American values when they refuse to acquiesce to the so-called “superior culture”. With its complex exclusionary histories, schooling does not support the very existence of students who do not meet this democratic ideal couched in a White, able-bodied, heteronormative model, and instead, schools remain stagnant in discussions and actions regarding the presence of non-ideal democratic participants (Love, 2019). What may be considered non-ideal in the citizenship framework is any participatory action that undermines the common way of engaging in the democratic process or, even worse, one that attempts to get to the root of social justice issues like income inequality, racism, sexism, homophobia, and so on.

As institutions of education “legitimize a hierarchical social order based on privileged and marginalized identities” (Rawlings, 2019, p. 701), they encompass various far-reaching democratic controls to reify and position individuals and identity groups based on differences. One mechanism of this control disproportionately criminalizes Black students in particular (Walton, 2018) through white-supremacist policies deemed necessary for maintaining safety within the institution (Rawlings, 2019). Black youth, when identified as undisciplined, are the perfect candidates to become schooling’s scapegoat and “source of societal ill” (Vaught, 2014, p. 157). Inequities, both implicit and explicit, ensure a system that “creates marginalized student and teacher populations through everyday teaching and learning” (Wozolek, 2015, p. 7). Identifying and Othering of marginalized students (Apple, 2006; Pinar, 1998) is further reified within systems of education wherein “historical and political structures of Anglo, heteronormative power are continually maintained” (Wozolek, 2015, p. 8). Mandated curricula normalize what Wozolek (2015, p. 14) refers to as “contemporary iterations of educational lynching,” thereby reinforcing students’ feelings of inadequacy and inferiority. As

such, educational institutions delegitimize undesirable democratic participants by denoting success and achievement explicitly within the context of White heteronormativity (Grady et al., 2012). The citizenship framework is often considered progressive in the sense that students move from personal responsibility to participatory to social-justice orientations (Blevins et al., 2020) which points to the fact that the personal responsibility orientation is the default position. It follows that one of the most powerful ways students' perceptions of their current or future political agency is undermined is to attack their character and some innate ability—couched in race, gender, sexuality, and/or ability—to be responsible citizens.

Today, we confront the historical obfuscation of intellectual, social-justice orientations as a result of Othering through both subtle and unconcealed mechanisms of silencing and eradication. Dismantling such embedded structures is possible by way of radical democratic participation and advocacy for social-justice orientations in the classroom. Excluding political undesirables' intellectual traditions amounts to de facto exclusion from fundamental democratic processes which rely upon deliberation and participation in public fora. For example, the privileging of "white scholarly discourse" as a means for "examining Black experiences" in academia (Grant et al., 2015, p. xvii), the democratic control of educational systems by White architects to ensure a "social order" based on racial supremacy (Watkins, 2001, p. 181), and the parallel movement of race-based worth, eugenics, and education (Winfield, 2007) point to an ever-present structure of schooling that measures, sorts, rewards, and punishes folk based on a rubric of democratic citizenship. These notions of whose scholarly work, whose leadership and guidance, and which people are more orderly in their race as well as their "class, habit, and behavior" (Winfield, 2007, p. 159) depend upon a White, heteropatriarchal, and anti-democratic network of knowledge and practice to ensure that the Other is always perceived as deficient under the criteria of democratic citizenship. In the following section, we consider Whiteness as the fundamental ordering mechanism that ranks and sorts human beings in preparation to be marginalized by anti-democratic structures in and out of schools.

Whiteness against participatory democracy

As a constructed yet meaningful social category, Whiteness is held together through its malleability. By maintaining an internal heterogeneity, hegemonic Whiteness endures alongside other possibilities of subordinate and marginalized racialized Whiteness (Lewis, 2004). Agential and pliant, Whiteness ensures its high social station "vis-à-vis interracial boundaries" (Hughey, 2010, p. 1292) while simultaneously exploiting internal variances of social class, gender identity, age, and sexuality (Omi and Winant, 2014). To maintain unequal systems of political power within schooling, practices and policies connect understandings of the ideal to notions of Whiteness and reify marginalization and racialization (Carter Andrews et al., 2019). Whiteness, defined by Sarah Ahmed (2007, p. 15), is "an ongoing and unfinished history which orientates bodies in specific directions".

Reaching far beyond limited racial identity constructs, abstractions of Whiteness attribute varied appearances, behaviors, and performances with a collective social privilege to validate selected actions and bodies (Ahmed, 2007). However, this collective privilege, which presents as natural formations of power, is not universal and can be countered through a collective recognition of and resistance against hegemonic ordering. When embodying Whiteness, one carries with them "the privilege of being perceived as innocent despite overwhelming evidence that signals otherwise" (Carter Andrews et al., 2019, p. 2538). In spaces awash in Whiteness, such as educational institutions, White bodies find comfort in this extension of their shape (Ahmed, 2007). Moreover, attempts at reconciling Whiteness in education against the illusions of social justice result in an educational dissonance for unwelcomed students who must navigate the precariousness of their identity against the ordering mechanism of Whiteness. However, for academic social justice to prove successful, an understanding of how affective Whiteness violently structures Western thoughts (Derida, 1976) and an understanding of what is and is not ideal under a anti-democratic rubric is paramount.

Whiteness's subtlety justifies its social control and distance (Lewis, 2004), while a guise of neutrality allows it to operate as a measure of humanity (Brodkin, 1998) against those who deviate from anticipated democratic norms—ordering them as Other. Affect also orders and positions, not by way of cognitive understanding, but rather through embodied experiences in relation and response to a (dis)orientation and (mis)alignment with surroundings (Ahmed, 2006). Socially and physically orienting inhabitants, spaces take on Whiteness' qualities, welcoming those who align while manifesting hostility for Others. As structures and sites of power "acquire the 'skin' of the bodies that inhabit them," locations of authority maintain exclusion—making certain they are (un)inhabitable for some" (Ahmed, 2007, p. 157). Within these democratic institutions of Whiteness, it is embodied Whiteness that goes unnoticed; Whiteness is the unremarkable presence upon which all others appear hyper-visible, deviant, or as those who have, in fact, deviated from socially negotiated practices (Ahmed, 2007). In addition to embodied racialization, Whiteness's abstraction serves to recognize a compulsion of order as one which demands the (de)valuing of bodies. When wielded as an ordering device, "Whiteness modifies and regulates bodies, assuring they 'line up' and fade into a model 'sea of Whiteness'" (Ahmed, 2007, p. 159). Those who fall into order, performing and modeling Whiteness, journey uninterrupted, while those who cannot—or will not—model Whiteness are met with suspicion, slowed, or stopped. The refusal to model Whiteness results in forms of internal exclusion from democratic debate (Young, 2000). Those who do not succeed in maintaining a performative alignment to Whiteness are systematically ignored, vilified, or expelled from public discussion.

Another crucial element in this matrix of power is that Whiteness serves as a foundation for normative citizenship that violently deploys "the logics of comparative anti-intersectionality" (Brandzel, 2016, p. 34). These logics assert themselves in "state-led practices of anti-intersectionality" (p. 23), which are streamlined through institutions of formal education via hidden and overt forms of curriculum. Along these lines, the school is but one site where the "state reproduces hegemonic epistemologies of identities that are normative, single-axis, and comparatively valued against other categories of identity" (p. 23). Whiteness is but one root of this

comparative epistemic project alongside others, as we have mentioned, that intersect with gender, sexuality, ability, and class hierarchies. The construction of the ideal participatory citizen through education centers around these kinds of anti-intersectional assimilation (Abowitz and Harnish, 2006). Broader notations of assimilationist citizenship coupled with White epistemologies conveyed through state education are keys to accessing the participatory model of democracy—to become an idealized participant in an idealized democratic system. Therefore, citizenship in the US conceptually narrows who participates and how they engage the model of democracy the state has created and maintains. Schools are a functional arm of this mechanism that inculcates children into its system beginning at the age of three or four years old and continues through the first two decades of a person's life.

As White orientations situate academic spaces, it ensures only those who acquiesce to Whiteness belong. Thereby granting access to individuals insofar as they cooperate through performative habituations to Whiteness—an act executed by those with varying racial identities. Indistinguishably tethered to white-supremacy, Whiteness assures Whites' racial position atop the social hierarchy via absolute contamination (Tsing, 2015) of (inter)actions (Bonilla-Silva, 2012). Whiteness is, as Pfeil (2007) suggests, the privileged mode of participating within systems of White heteropatriarchy and is conferred by those who experience the standpoint of external racialized Whiteness. Internalized Whiteness is enacted unconsciously through habitual actions serving to reify white-supremacist ideals to exclude all other ways of knowing and being (Grimes, 2017). While White racialized bodies present visible Whiteness, ascribing to an external reproduction of Whiteness with ease, they too must attend to the task of White performance and ordering. The added burden of "acting White" for those marginalized by racism, however, has profoundly violent psychological consequences, including that of cultural dissonance (Ogbu, 2004). This violence epistemologically silences social-justice counter-narratives by isolating their experiences from any connections to racism, discrimination, or dispossession (Carter Andrews et al., 2019).

With its regular application and practice, Whiteness inscribes actions to define appropriate embodiment through spaces already awash in White ideals. Individuals ensure a "correct and competent" Whiteness via performances that align with oppressive symbolic practices (Hughey and Byrd, 2013). These "socially negotiated practices," (Lewis, 2004, p. 634) such as "talking White" (Boulton, 2016, p. 5) or not adhering to time constraints "carry a variety of material rewards and penalties" (Lewis, 2004, p. 634) including access to or exclusion from political engagement. Additionally, policies demanding students request permission to attend to basic bodily needs like eating, drinking, or using the restroom strip them of their agency and dignity. In its elusiveness, Whiteness is not recognized by those who inhabit its manifestation. Instead, Whiteness "trails behind" them, orienting the body within White spaces, shaping "what bodies can do" (Ahmed, 2007, p. 157). Thereby ensuring those with White racialized bodies can "[hijack] the institutional structure of society for private benefit" (Jaycox, 2017, n.p). Compulsive ambient practices of ideal Whiteness permeate historical logic by dictating who can take up space and what they can do (Ahmed, 2007). Functioning as a *trompe l'oeil*, counter-Whiteness's epistemological silencing works to mask discrimination (Carter Andrews et al., 2019) while constructions of Whiteness materialize as obstacles for democratic participation for those who do not enact it (Wozolek, 2015/2020). These perceptions of political deficiency are not merely reproduced in abstract, bureaucratic workings of educational institutions. These violences have real, material impacts on students' bodies as they navigate Whiteness-as-order in schools, are routinely disciplined for transgressing the boundaries Whiteness establishes, and come to develop an affective resistance to behavior within the democratic order.

Schooling as affective violence

Amid the deluge of idyllic clichés about education—that it can save us, that it can promote socio-economic equity, that it can promote democratic activism—there are more insidious consequences for students who experience schooling as a violent encounter with powerful institutions and authorities. These consequences may be difficult to come to terms with, especially for those of us who are embedded in these institutions who would like to think of the teaching profession as an exemplar of care for all children, their academic achievement, and their social and economic advancement. However, attractive as these clichés are as they work to inspire teachers and administrators to keep fighting for social justice, learning to engage in radically democratic teaching practices, and implementing liberatory pedagogies, these goals remain unachievable if educators continue to ignore the harmful effects of schooling and refuse to undermine them. To acknowledge these platitudes as such would mean that the increasingly diverse but still predominantly White, middle-class teaching force and their administrative counterparts (Ingersoll et al., 2018, pp. 14–16) would be required to confront the color-evasive (Annamma et al., 2017) approach to their practice instead of "[ensuring] the maintenance of the status quo, to ensure that power, the culture of power, remains in the hands of those who already have it" (Delpit, 1988, p. 285). Harber (2004, p. 40) notes that this refusal to see the violence of schooling is the result of a "tendency for *ought* to come before *is* and for it to have an idealized, taken-for-granted image as inherently good and beneficial". This *ought* is an *ought* about character which sorts for race, ability, class, sexuality, and gender; ignoring the complex relationality of individual and group identity and the violence that is socially reproduced through schooling. Instead, it is crucial that educators become willing to interrogate these violences and work to uproot them on their own campuses and in their own classroom practices.

Drawing on Salmi's (2000) work on violent educational formations, Harber (2004, pp. 44–45) describes *repressive* violence as "the deprivation of fundamental human rights" and alienating violence as "the deprivation of higher rights" that exists in schools. These less visible forms of violence lend themselves to indirect violence as "a violation of the right to survival" as well as actual, physical, direct violence in schools and society as "deliberate injury to the integrity of human life". In other words, it is clear that the repression of students' freedom of thought, speech, and equality originate within an alienating social environment

saturated with classism, transphobia, racism, sexism, Islamophobia, and anti-queerness in schools. These exclusionary boundaries are a catalyst for other purportedly more serious forms of violence like physical and psychological bullying, hate crimes like assault and murder, and other forms of mistreatment.

Violent schooling cannot be solved by addressing these violences individually but by actively confronting the authoritarian structure of schools—where children have little to no power over what they learn or how they learn it and where disciplinary mechanisms demand thoughtless obedience to authority and rigid compliance with policies. Along these lines, the material spaces of schools must be interrogated in parallel with the material bodies within these spaces and, in particular, their ability to engage in democratic processes. When students resist democratic disciplinarity and foreclosure by making their bodies, knowledges, and ways of being visible and vocal, they risk an encounter with the institutional violence of schooling and exclusion from decisions that influence their lives. In short, to be present as they are, embodied as they are actively confronts the anti-democratic ought of schooling. Instead, students should be seen as the legitimate democratic actors that they are rather than as schools and educational authorities dictate they ought to be.

Understood as an ever-evolving entity, assemblages of violence include and are informed by historical and current context “constructed through violent inter-actions that touches one’s body and/or is taken against one’s ways of knowing and being” (Wozolek, 2018, p. 15). Through coded language, access, assumptions, and White ideals, assemblages of aggressions manifest in violence toward unwelcomed bodies. For those who do not embody racialized Whiteness, regardless of their White performativity, its mandated reproduction violently displaces identity causing psychological, cultural dissonance (Ogbu, 2004). Importantly, these violent assemblages are not merely coincidental with a historical legacy of political dispossession through violence that continues despite efforts to resist it. Instead, these violences are ongoing material violations that operate on a “logic of injury in addition to a process of subordination” (De Lissovoy, 2015, pp. 63–64). This means that the demands to reproduce Whiteness and the racism that must accompany this project are both “active and willful—not simply required of Whites but even enjoyed by them”. as they are granted access to forms of democratic participation and deny participatory access to Others. Schools, which function as spaces for students, in varying degrees, to comply with or resist a forced assent to Whiteness, are also spaces where “categories of deviance” are reproduced and “tools for injury” are deployed against politically minoritized students.

The very embodiment of those deemed Other in these limiting spaces affectively codes how marginalized participants negotiate lineages of historically frozen yet ever-changing abuses. As agential (Rosiek, 2017), discrimination remains embedded historically while malleable to present-day practices, adapting to current racist, sexist, classist, ableist, and anti-queer hegemony. Affect works alongside this transformative and evasive Whiteness as a spillway for the past to be of current significance. Situated within an ongoing past, historical rememberings are persistently woven throughout present-day encounters and influence future endeavors (Haugeland, 2013). Connecting to affectivity recognizes contextual nuance beyond that which is physical to situate the self in such a way as to acknowledge the ever-present “always more” alongside a lack of understanding, the “always less” of intelligibility (Slaby, 2017). That is to say, students, educators, administrators, and community members must labor, albeit in ways not always perceived, by continuously tuning into their surroundings. While one absorbs, adapts, and processes the world around them, they remain in or out of tune, embroiled in multifaceted and untold ways (Slaby, 2017).

Seen and understood through the white-supremacist gaze of education, White students are viewed as the “unequivocal embodiment of innocence” while Black students are understood as “dangerous, promiscuous, sassy, threatening, overly independent, and needing less nurture, protection, support, and comfort” (Carter Andrews et al., 2019, p. 2539). The correlation of Whiteness to “normal” underpins notions of Whiteness to safety (Blount, 2000, p. 92). Conversely, as Blackness is deemed dangerous, a vision of “black innocence is a structural impossibility” (Wun, 2016, p. 744). Reinforced by policy, Black children who “exist as a trope in liberal state schools” are already recognized as discipline subjects to alleviate the school of responsibility by prioritizing individualization (Vaught, 2014, p. 156). In doing so, Black students face negative experiences linked to behaviors coded as individual inadequacies. Thereby declaring that these “unfit subject[s] are not conceived of as unfit through the systems of power and domination that produce them, such as misogyny and homophobia,” but rather by an innate deficit (Vaught, 2014, p. 156).

Cultural reproduction within educational institutions (Bourdieu, 1971; Nash, 1990) establish and reinforce “White middle class cultural norms” as a “foundation for a reproduction of privileged cultures in the larger education system” (Jennings & Lynn, 2005, p. 21). Schooling mandates the adoption of “stereotypical, demeaning, and pejorative representations of ways of being” wherein notions of intelligence as White property dehumanize and typecast racially marginalized students who are perceived as unintelligent and disorderly (Carter Andrews et al., 2019). Notions of beauty, intelligence, and worth constructed within Western heteropatriarchal parameters ignore Blackness (Collins, 2004) and presume their danger by exclaiming they are not well suited or welcome within the field of education. These notions are not only expected to be learned and recited but also practiced and embodied to the extent that marginalized individuals repeatedly assent to Whiteness, as they are implored to leave their non-normativity behind but remain perceived as Other despite ongoing violent adaptation to anti-democratic ways of knowing and being.

Conclusion: the body as a site of resistance

While structural change is paramount, it is unlikely to occur in any significant form in the immediate future unless teachers begin to work to offer students opportunities to engage in democratic processes. To undermine Whiteness in education and resist

exclusionary, anti-democratic ordering mechanisms, responsibility must fall to those with authority—not to students who, as this work has demonstrated, embody the very notions of resistance through their educational and political survival. Privileged educators as co-conspirators (Love, 2019), such as those who are heterotypical or embody Whiteness in light-skinned-European bodies, must labor alongside so-called non-ideal students and colleagues. They should sacrifice their privilege to enact antiracist, pro-queer, fully inclusive democratic practices. One small step educators may be able to take is to take up a social-justice orientation toward citizenship and democratic participation. Individual educators' recognition of Whiteness as an ordering mechanism, denoting who is granted political access and participation, must be deconstructed to recognize Eurocentric, heteropatriarchal, ableist, classist foundations (Derrida, 1976). An acknowledgment of such, however, demands a participatory collective to resist disproportionate, privileged access to democratic mechanisms imbued through Whiteness.

To be hospitable toward those who are perceived as non-ideal, educators are invited to imagine schooling as a radically inclusive entity, one which authentically welcomes all visitors and encourages democratic participation. Welcoming those coded as non-ideal challenges administrative and social policies dictating how students will experience schooling and see themselves as political subjects. Unquestionable educational hospitality, while an imperfect, contradictory, and idealistic goal, "emerges from the conflict between what we imagine and what we can do; our commitment to justice and human rights does not, and indeed cannot lie flush with social practices" (Gilbert, 2014, p. 93). This dissonance between social hegemony and administrative policies forces educators to evaluate their roles as citizens within a larger society, as actors of democracy, and as culpable for educational violences. If we are to be authentically welcoming of all, a radically queer acceptance "demands that we accept what is not yet intelligible" (Gilbert, 2014, p. 84) before inquiring if or how they fit into White democratic ideals.

This hospitality, this welcoming, is not only a matter of warmly appreciating, respecting, or accepting all but, as Bettina Love (2019, p. 9, 54) reminds us, that "to want freedom is to welcome struggle". As co-conspirators, we welcome the necessary struggle involved in moving beyond merely surviving to joyful thriving in and out of educational institutions and especially in public political fora. We want to reiterate that anti-racist teaching "is not just about acknowledging that racism exists but about consciously committing to the struggle of fighting for racial justice". If youth are not granted access to the machinery of democracy, then this college struggle for racial justice will be restricted due to their lack of involvement in ongoing activist projects. We want to reemphasize that the historical and long-lasting impacts of democratically supported Whiteness have not only sculpted education in its image but continue to violently shape the material bodies and minds of students, teachers, administrators, and communities through political exclusion. Any attempt to resist these institutionalized racisms, classisms, sexism, ableisms, and heterosexisms must be prior to words, policies, and actions—it should originate in ourselves and become manifest in our material bodies.

At its core, anti-racist and abolitionist education is about "the freedom to create your reality, where uplifting humanity is at the center of all decisions" as much as it is about "tearing down old structures and ways of thinking" (Love, 2019, pp. 88–89). These notions of critical deconstruction, freedom to (re)create, and ability to engage politically are embodied possibilities for transformation of ourselves, others, and society. Transformation at any level is often a slow, arduous, and iterative process in liberatory projects. We must be critical and hospitable as we work to fundamentally reposition our educational institutions as sites of resistance, homeplaces, and homespaces counter to Whiteness, anti-democratic frameworks, and affective violence.

Introduction

Work and learning lie at the center of fields, such as workplace learning, vocational education, human resources management, organizational learning, industrial relations, and labor education. While work is commonly associated with waged employment, in this chapter, we address work broadly as activities that are socially organized to achieve goals that are work related. The definition of learning varies widely across the literature. When considering the unit of analysis for learning, i.e. the analytical focus of researchers, often the projected sites of intervention in studies of work and learning, three major approaches can be identified. The first is the conventional approach that focuses on the enhancement of individual skills and competency. The second is the critical approaches that challenge social hierarchies and structural injustice through the promotion of personal empowerment, conscientization, and solidarity. The third is the practice-based approaches that seek to understand learning as the effects of sociocultural and sociomaterial practices. This chapter provides an overview of the major approaches to work and learning, giving special attention to the trends of development in each approach. It starts with an overview of the changing context of work. It then introduces these approaches, with attention to their theoretical premises, units of analysis as well as the goals they ascribe to education and learning. The paper ends with a recap of this chapter and a discussion of the development of work and learning research.

The changing world of work

[Modernity] is a paradoxical unity, a unity of disunity: it pours us all into a maelstrom of perpetual disintegration and renewal, of struggle and contradiction, of ambiguity and anguish. To be modern is to be part of a universe in which, as Marx said, "All that is solid melts into air."

Berman (1982, p. 15).

The history of modern societies is largely a history of contradiction driven by capitalist expansion, and it has always involved changes to traditions and traditional forms of culture, economic structure, and social relations. The scale and speed of changes the world has experienced since the 1960s and 1970s, however, are phenomenal. Globally, European occupation of former colonies came to an end as a result of the independence movements in Asia and Africa. Meanwhile, the established capitalist west was struck by a massive economic recession coupled with social unrest. To salvage itself from the social and economic crisis, the western world chose to embark on economic globalization, which marked the commencement of an era of flexible capitalism (Sennett, 1998) or flexible accumulation (Harvey, 1990).

Riding on swift technological development, and facilitated by the ideological spread of neoliberalism, economic globalization is a multifaceted and developing story. It is known for instigating a race to the bottom, with manufacturing and sometimes service jobs outsourced to countries and areas that "need" to be developed and modernized, and that offer lower labor costs and higher tax incentives for foreign investment. It is also associated with the accelerated mobility of people on a global scale, as countries ratchet up efforts to attract skilled workers, which leads to brain drain from developing countries to the developed west. Today, we are experiencing not only the mobility of goods, services, and capital, but also that of people, culture, ideologies, technologies, and other non-human things/beings. Hannam et al. (2006) observed that these multiple and intersecting mobilities "seem to produce a more 'networked' patterning of economic and social life, even for those who have not moved" (p. 2). This is not to say that the world is flat

now. It is rather to suggest that the geopolitical configuration of globalization has been continuously (re)configured. Indeed, the western centric order of globalization has been challenged. One example in this regard is the Indigenous resistance against (neo)colonialism, displacement and deprivation of land (Tuck and Yang, 2012; Smith et al., 2019). It has also been threatened by the rise of emerging economic powers, such as Brazil, Russia, India, and China. The global pandemic of COVID-19 has also underscored the vulnerability of a world on the move. Clearly, while western powers still dominate, borders of all kinds have become permeable, and porous, as much as they are entrenched.

In the midst of all the global changes, the world of work continues to shift. In the economic west, with the decline of the manufacturing sector, countries have seen an expansion of the services sector. In developing countries, the quality of employment remains poor, and vulnerable groups such as women and people with less education are less likely to have access to quality jobs (United Nations, 2020). This structural change in the west has given rise to the illusion that the postindustrial countries have entered an era of knowledge economy. Much earlier, in his forecast for a postindustrial society, Bell (1976) suggested that sciences and technology would facilitate the expansion of the services sector and would lead to an occupational shift toward professional and technical class. Despite this prediction and all the celebration of technological advancement, studies show that services professions are segmented, if not polarized. While occupations premised on scientific and professional knowledge are growing in importance, they remain smaller in the aggregate than other parts of the economy (Brint, 2001; Brown and Lauder, 2006; Popiel, 2017). In other words, if the knowledge economy is a utopia, not everyone has entered it. Also of note, while the value of knowledge economy is rarely debated, the current COVID-19 pandemic, which has significantly slowed down our economic lives, has provided us with a reality check. Among other things, it has certainly taught us to re-evaluate the value of essential work, including the work of cleaners, servers, retail workers, transit workers, health aides, and other workers who keep our lives going and yet whose work has rarely been appreciated.

Given the structural changes, the organization of employment patterns has shifted as well. Postindustrial countries have moved from a system of standardized lifelong employment to a system of boundary-less and protean careers. In place of standard, stable, and lifelong employment, we have seen the normalization of “non-traditional”, “non-standard”, “project-based” and “contract-based” employments. This has to do with the perceived needs for corporations to become more responsive to the demands of the market, which may easily fluctuate. It also has to do with the retreat of the welfare state, which means less social protection for workers. These non-standard employments, particularly those at the bottom of the economy, typically come with “limited social benefits, and statutory entitlements, job insecurity, low wages and high risks of ill-health” (Vosko, 2006, p. 3). Racialized workers, migrants, and women are much more likely to take up positions that are feminized, insecure, low-paying, and precarious. In the middle of all the changes, unions across OECD countries since the 1980s have shrunk in both membership and influence (Wallerstein and Western, 2000; Vachon et al., 2016).

It is impossible not to address the impacts of technological changes when discussing the changing world of work. When taking on the standpoint of capital and the management, it is easy to be drawn to the productive benefits of new technologies. Technological advancements, particularly what Schwab (2016) called the fourth industrial revolution, a digital revolution marked by nanotechnology, quantum computing, and new processes, seems to promise more meaningful work, and perhaps a new and flattened work order (Gee et al., 2019) where workers or knowledge workers may exercise more discretion and control at work. When taking the perspective of labor or Marxist labor process theory, however, questions have long been raised about whether technological change has led to workers’ autonomy at work (e.g., Braverman, 1974; Rifkin, 1995). Instead of flattening workplace hierarchy, much research has shown that technological change does not necessarily bring with it workplace democracy (Beirne and Ramsay, 2019). Instead, it is implicated in the tightening of managerial manipulation despite the use of rather democratic language. Moreover, it also diverts our attention from the kind of deprivation and systematic exploitation and injustice that people in the developing world experience (Gee et al., 2018).

Studies of work and learning: three main traditions

Against the backdrop laid out above, work and learning have attracted increasing attention across fields. Taken together, related research typically focuses on how individuals, groups, and organizations learn, how knowledge is “transferred” and managed, and how educators, organizations, and institutions might better organize, educate, and support learning across settings. Notably, researchers of work and learning are rarely impartial observers. Rather, they conduct research with diverse interests: some to improve pedagogies of teaching; some to enhance productivity; some to contribute to the well-being of individual workers; and others to challenge the capitalist system of exploitation. It follows that the unit of analysis that researchers focus on varies. Based on the unit of analysis or the projected site of intervention, the literature evinces three traditions: the conventional approaches that focus on individual acquisition of skills and competencies; the critical approaches that believe in the need to challenge existing power hierarchies and structural injustice through collective empowerment and consciousness raising; and the practice approaches that see learning as a derivative effect of social practices.

The conventional approaches to work and learning

The conventional approaches are variously informed by behaviorism, cognitivism, and constructivism, and they focus on how individuals may learn to enhance their skills, competencies, employability, and human capital. Behaviorism assumes that learning is

about effecting observable changes in human behaviors. However, observable behaviors alone are not reliable in predicting job performance. As such, attention has been directed to unobservable cognitive activities, such as thinking, reflecting, knowing, and understanding (Belanger, 2011). For example, drawing on organizational psychology and management theory that focuses on organizational effectiveness and individual well-being, Chris Argyris and Donald Schön (1974, 1978) emphasized that human reasoning underlies individual behaviors within organizations. To give an example, when people join an organization with a defensive mode of reasoning, they tend to get into routines that preempt embarrassment or threats, may negatively affect on organizational performance and effectiveness. What is needed is for management to critically examine staff's defensive reasoning and help them take on productive reasoning (Argyris, 2006). Schön (1992) further highlighted the importance of reflection in how professionals solve workplace challenges. He opposed the dominant technical rationality or "the application of scientific theory and technique to the instrumental problems of practice" (p. 30). Instead, he stressed that contexts of application are often characterized by "uncertainty, uniqueness, instability, and value conflict" (p. 42). To deal with uncertainty, reflection-in-action is the key, which allows individuals to think about and criticize their prior understanding of the phenomenon and, perhaps to generate a new understanding of it as well (Schön, 1992).

The theory of constructivism is "an approach to learning that holds that people actively construct or make their own knowledge and that reality is determined by the experiences of the learner" (Elliott et al., 2000, p. 256). A multitude of adult learning theories, such as experiential learning and transformative learning, have been influenced by constructivism. To give an example, Marsick and Watkins (2018), who have contributed to the conceptualization of informal and incidental learning, "focused on how individuals learn by engaging an ongoing, not necessarily sequential, interactive cycle of learning from experience that started with an unfamiliar challenge or problem at work that triggered informal or incidental learning" (pp. 10–11). Their theory then evolved to emphasize not only individual agency in meaning construction, but also the power of social interaction in shaping learning.

In all cases, conventional approaches to work related learning and training focus on individuals' acquisition of skills and competencies so that they fit into the normative expectations at work. In the last few decades, a variety of occupational matrices of skill and competency have been created as the cornerstone of instructional designs, prior learning assessment, foreign qualification recognition, professional education, and occupational certification. A common trend with these matrices is that they have covered not only hard and technical skills and professional specific competency, but also soft skills, and individual dispositions. While this expanded discourse of skill seems to be self-undermining (Payne, 2000), it correlates with, and indeed supports, the shift of industrialized nations toward a service-based economy, which capitalizes on the commodification of personal emotions, attitudes, and ways of presentation.

Notably, these matrices of skills and competencies have reshaped the social and power relations among learners/workers, employers, educators, and administrators (Jackson, 1993). To start with, they seem to be providing employers, the managerial staff, and administrators with "objective" reference points, and quality assurance vis-a-vis a diverse workforce. This dovetails well with the movement toward new managerialism that stresses observable benchmarks for performance, efficiency and effectiveness. Over time, employers and industries have developed more control over what counts as valuable skills and competencies. In contrast, educators' power and discretion in teaching have been circumscribed to the extent that they are expected to deliver prescribed competencies (Hodge, 2016). This type of control has been referred to as controlled vocationalism (Bates et al., 1998, p. 115). Not only does it shift the control of the content away from the educators, but it ties the goal of training and education to the instrumentalist needs of the economy. As a result, educators might be subjected to constant surveillance. They may be pressured to deliver programs in accordance with competency standards. In neoliberal economies, where instructors are faced with increased job insecurity, controlled vocationalism may also mean that "[i]nstructors ... fearfully develop a self-control or self-censorship that steers away from teaching and learning of social justice" (Abendroth, 2014, p. 20).

With all the emphasis on individual skills and competencies, there is also an expectation for individual workers to mold themselves into an entrepreneurial self, i.e., a subject who takes responsibility for becoming successful at work and in life. This ideology has underpinned many adult education or training programs. For instance, in Maitra's study (2018) of career training programs offered by immigrant services organizations in Canada, she found that the programs tend to emphasize the importance of self-sufficiency and self-endeavor for immigrants to become a competitive and productive worker in the labor market. What often escapes our attention is that the discourse of entrepreneurialism is based on "subtle domination and discrimination inducing individuals into internalizing certain discourses of success and economic productivity irrespective of the actual structures of domination" (Maitra, 2018, p. 209). Such programs are not positioned to address systematic social barriers that the learners might be faced with (e.g., Warriner, 2016). In a similar study in the Canadian context, Shan (2015) also observed that when re-training and re-education overlook the social and ideological processes that shape immigrant women's training and career "choices", they would act "as a 'sorting' process" that continuously enters immigrant women into a labor market "stratified by gender, race, ability and other axes of differentiation" (p. 187).

Critical approaches to work and learning

The development of critical perspectives on work and learning, especially since the 1980s, could be understood as a systematic exploration of the relationships between labor, learning, and the knowledge economy in the context of global capitalism (Bratton et al., 2004). Critical researchers believe that maldistribution of economic goods and unequal distribution of power along intersectional lines of social differences, such as gender, race, ability, and sexuality, are the main source of social injustice, conflicts, and violence. Equalizing the distribution of economic goods and recognizing cultural differences are proposed as the major remedies

to advance social justice (Fraser, 2004). Critical studies of work and learning often center analysis of conflicts, power, inequality, agency, and ethics (Malloch et al., 2011). Related research is variously informed by historical and dialectical Marxism (e.g., McLaren and Jandrić, 2018), Freire's pedagogy of the oppressed (1970), Habermas' idea of communicative action (e.g., Welton, 1991, 2014), Gramsci's notions of "hegemony" and "common sense" (Carpenter et al., 2013), critical race theory (e.g., Crenshaw, 1991, 2011; Closson, 2010), and much more. While it is impossible to provide an exhaustive survey of critical approaches, we focus on three new trends of development in the critical tradition.

The first trend could be characterized as "intersectionality at work" – also the title of Tariq and Syed's work (Tariq and Syed, 2017) on South Asian Muslim women's experiences of employment and leadership in the UK, which pointed to a range of challenges (and sometimes opportunities) that the women faced at the intersection of gender, religion, race, and ethnicity in workplaces. Intersectionality thinking has been applied in the study of work and learning across geographical sites, identity spectrums, and workplace pathways/hierarchies – from Black women's entrepreneurial experiences in Canada (Knight, 2016), to disabled women's workplace well-being in the US (Brown and Moloney, 2019); from ethnic minority women's organizational leadership in South Africa (Carrim and Nkomo, 2016), to both men and women employees' work in a prestigious accounting firm in Mexico (Ruiz-Castro and Holvino, 2016). In these works, intersectionality helps researchers grapple with various dimensions of workplace learning, including but not limited to identity work, discrimination, career impediment, and critique of global capitalism. Despite the wide range of application of intersectional thinking, there is no consensus on what constitutes intersectionality. In Patricia Collins' (2015) language, intersectionality work can be considered as a "knowledge project" (p. 1) suited to the analysis of interlocked social inequalities, power differences, and structural loopholes.

The second trend is the critical engagement with transformative learning in the study of work and learning. In general, this engagement concerns the transformative potentials of workers' identification in relation to the multifaceted formation of learning spaces. Along with van Dellen and Cohen-Scali (2015), we argue for a more holistic conception of "workplaces as learning spaces", and promote learning spaces that "matter in an affective, cognitive and social manner" (p. 733) so as to reduce alienation that workers may experience. In this regard, we are pleased to note that spirituality has become a focal point of consideration in workplace learning practices. For example, Groen and Kawalilak (2016) used autobiographical reflections to affirm a deeper, more spiritual and holistic practice of transformative learning beyond the analytic, rational transformation of individual learners/workers – a practice that moved people toward the creation of more relational and caring workplaces in higher education. In another example, Tolliver's study (Tolliver, 2016) of African epistemology and diasporic activism demonstrated how transformative learning infused with workplace spirituality could "provide powerful incentives for employees not only to 'see' social justice issues but also to commit to addressing instances of social injustice within the workplace as well as in the world" (p. 81). Knowing the necessity to challenge structural racism and white supremacy in both formal and informal learning (Brookfield, 2019), we ask how this "spirituality" turn could become explicit antiracism strategies.

The third trend in the development of the critical approaches is for researchers and scholars to confront white supremacy through decolonization. This trend has gathered momentum in particular in the studies of immigrants' work and learning experiences. For example, primarily through an examination of the employment experiences of transnational migrants, Maitra and Guo (2019) defined projects of decolonization in lifelong learning in four dimensions: recognizing the colonial power differentials embedded in knowledge-making; challenging the hegemony of Western knowledge, education, and credential recognition; planning and designing learning curricula based on non-Western knowledge system; decolonizing our minds as lifelong learners, practitioners and policy makers. In another example, Morrice's (2019) drew on Santos' (2016) notion of abyssal thinking and exposed how a West-centric, colonial, restrictive migration-education nexus maintains traditional colonial power divisions, exclusion, and control. She instead called for a global, structural reimagining of educational spaces that recognize "the particularity of subjectivities and struggles of migrants, and others in the global South", and advocated that such struggles should be accompanied by the production of "new forms of emancipatory knowledge" (p. 30).

Of note, the move toward decolonization has recently joined hands with the social and intellectual movement of indigenization. A body of research has emerged that centers Indigenous worldviews, recognizing Indigenous authorities on land stewardship, knowledge systems, and promoting cultural practices beyond the settlers' purview and beyond 'acceptance' or liberal inclusion. For example, affirming Maori authority in Aotearoa New Zealand workplaces, Huygens (2006) insisted that decolonization requires a move from organizational accountability (practices within a particular institution) to constitutional accountability (practices connected to the larger society). Working as Indigenous persons (Plains Cree, Saulteaux, and Mi'kmaq) in the Canadian context of distance adult education, Kovach and Montgomery (2010) pointed out the need for instructors and staff within the organizations to "design decolonizing curricula that engages Indigenous knowledges and upholds oral culture" (p. 27). While there has always been a crucial connection between labor education, union activism, and labor movements (Spencer, 2002), Ng and Huang (2012) worked with labor educators and activists to explore how a critical, decolonial approach to relationship building – through a "pedagogy of solidarity" and the work of "solidarity circle" (pp. 533–535) – could connect labor educators, activists, and movement organizers from Indigenous and racialized communities.

We emphasize that not all narratives *about* or *including* Indigenous people are critical. One vital question remains: how do we ensure the efforts and processes to facilitate Indigenous participation, knowledge, and learning in workplace do not repeat a paradigm where Indigenous learners and voices are included, and yet the larger oppressive structures are left unchallenged? Furthermore, as critical researchers work with Indigenous worldviews, they may necessarily might experience cognitive dissonance. For instance, as Grande (2008) pointed out, "[w]hile it is evident that revolutionary critical theory holds great promise, because it also retains core Western assumptions, it also stands in tension with those central to indigenous pedagogies. Specifically, the radical notion of

'democratization' does not theorize the difference of indigenous sovereignty ... and insofar as the discourse of revolutionary critical pedagogy is informed by Marxist theory, it retains a measure of anthropocentrism that belies indigenous views of land and 'nature' (pp. 234–235). In this context, Grande (2008) asked critical researchers to work with she called "red pedagogy", which is to create a space of reflexive engagement between critical theory and Indigenous worldviews.

The practice-based approaches to work and learning

If the conventional approaches are interested in fostering learning so that individuals keep up with the changing needs of the working world, and the critical approaches are invested in challenging the oppressive social structures, the practice-based approaches focus on mapping social practices that give rise to learning as a derivative effect (Fenwick and Nerland, 2014). The practice-based approaches to learning are informed by what Schatzki (2001) called "the practice turn" and the practice-based learning theories fall largely into two categories: the sociocultural and the sociomaterial. The former include situated learning, community of practices (Lave and Wenger, 1991; Wenger 1998) and cultural historical activity theories (Engeström, 2001). Informed by social cognitivism and social constructivism, situated learning examines learning as a process of social participation in the world. In Lave and Wenger's study of apprenticeship of trades people (1991), learning is understood to be a process of legitimate peripheral participation in a community of practices (CoPs), i.e., a group of people engaged in a common domain of practice, sharing ideas, and looking for solutions to problems (Wenger et al., 2002). The notion of CoP has been widely taken up in managerial and organizational studies that aim to refine practices, facilitate knowledge transfer and promote practice innovation (e.g., Bolisani and Scarso, 2014; Pyrko et al., 2016).

While CoP addresses people's learning experiences in relation to their membership within CoP, it does not attend to the power differences that may impact our access to CoP (Hodkinson and Hodkinson, 2004). Further, with its sole emphasis on the cultural conditioning of learning, it may have occluded the political and economic relations that shape CoP. In these respects, Engeström's (2001) CHAT usefully extends the illustrative power of CoP. CHAT is influenced by Vygotsky's cultural historical studies of psychology, which is a "psychologically relevant application of dialectical and historical materialism" (Vygotsky, 1978, p. 6). It is attentive to work practices as a cultural and historical system pivoted on an object, i.e., a social concern that focuses our attention, engages our efforts, and generates individual and collective actions and interactions. It also directs attention to the interrelations among individual subjects, objects and mediators of learning, in relation to the rules, community, and division of labor (Fenwick et al., 2011). While addressing multiple voices and interests, CHAT is also apt at identifying contradictions in practice as driving forces of change. Engeström et al. (2014), for instance, elaborated on how transformative agency and expansive learning evolve as individuals work through contradiction, raise questions, experiment with solutions, and expand objects and practices.

While sociocultural theories approach practices as activities that are purposeful, ordered, and regular, sociomaterial perspectives, exemplified by complexity theory, actor network theories, and assemblage thinking, help us zoom into practice as it is produced from moment to moment (Fenwick and Nerland, 2014). Developed initially in sociology of sciences and technology, sociomaterial perspectives have been used to study professional learning and professional work that are highly populated with texts, tools, and digital technologies (Fenwick et al., 2012; Reich and Hager, 2014). Typically, sociomaterial research stays away from reifying or naturalizing established sociological explanatory categories or schemes. It is rather interested in following the actors empirically, and hence is sensitive to the emergent sociomaterial organization of work and life, which may defy predictability and stretch human imaginations at all times (Fenwick et al., 2011). From the sociomaterial perspectives, non-human things are no longer treated as the contexts for learning and work or mediators of human action but as agentic actors. Star's notion of boundary object is illustrative in this regard. According to Star (2010), a boundary object is "something people (or, in computer science, other objects and programs) act toward and with. Its materiality derives from action, not from a sense of prefabricated stuff or 'thing'-ness" (p. 603). Boundary objects are known for their interpretive flexibility which arises organically in response to the requirement for information and work (Fenwick et al., 2011). Looking to the formation of sociomaterial relations focuses researchers' attention on the exterior relationality among heterogeneous entities and on the provisional sociomaterial ordering that may give rise to opportunistic, innovative, and creative forms of learning and engagement (Johnsson and Boud, 2010).

Of note, issues of social justice and power differences, especially those associated with gender, race, class, and other relations of differences, are not typically the focus of practice-based studies of work and learning. What is more, in most of the sociomaterial studies, power is not considered the cause of action, but rather the consequence of it (Latour, 1986). Latour's translation model of power, for instance, shows that power is not possessed by particular groups. Nor is it what one does to another. It is rather something that is worked on or up within a chain of actions where each actor shapes it as it circulates. In this view, power is produced "by enrolling actors in a given political and social scheme" (Latour, 1986, p. 264). In other words, power is modified as humans and non-human things hang together and perform themselves into being. While not all practice-based research has a social agenda, we believe that there is potential to mobilize this performative view of power for a more critical and nuanced understanding of work and learning.

Discussion and conclusion

Learning has accrued more attention today given the changing context of work since the 1970s. In the era of neoliberalism, learning seems to have become a lifeline for people to keep up with all the changes in the working world. Correspondingly, there has been an

increasing number of studies that focus on the learning needs and experiences of different groups, often marginalized groups in relation to their work experiences. This chapter reviews the scholarship of work and learning across fields based on the unit of analysis, or the analytical focus of researchers. It points to three traditions of scholarship. The first, also the dominant one, is the conventional approach that focus on individuals' development of skills, competencies, and dispositions. In this tradition, individuals are treated as generic learners and workers who could be better positioned in the labor market through continuous investment in learning. While there is no doubt that learning is instrumental to improving individuals' employability in the labor market, a few questions need to be asked. The first is whether all individuals are uninhibited entrepreneurial learners and workers, regardless of backgrounds. The second is whose interests and perspectives are reflected in the kind of skills and competency that are valued within vocations. The third is how controlled vocationalism (Bates et al., 1998) may limit the work of educators and, associated with this, how we might be able to expand the goal of education beyond instrumentalism.

The second tradition is the critical perspectives that direct attention to how the realities of work and learning are inseparable from unequal power relations and systems of domination. Related research suggests that struggles for good or meaningful workplace learning are indeed struggles for liberation. Such an understanding is based on various approaches: systematic exploration of learners/workers' uneven positionalities linked to their intersecting subjectivities and social differences; reflections on how holistic personal and relational transformative learning could lead to more equitable, caring workplaces; and practices and visions of decolonization that not only recognize the diverse knowledge systems of indigenous people, but also require further critical studies of work, learning, and justice from non-Eurocentric, non-anthropocentric perspectives.

The third is the practice-based approaches to learning, which is a relatively new trend that have gathered momentum in the last twenty years. Research in the former two traditions suggest that learning, training, and education are often positioned to fulfill two objectives: one is to prepare men and women for their work roles, and the other is to promote independent and critical thinking of individuals as social beings (Spencer and Kelly, 2013; Morrice et al., 2018). The practice-based approaches do not necessarily commit to either objective. Theoretically, these approaches are good at tracing the sociocultural and sociomaterial relations that give rise to human and organizational learning. In a world that is marked with multiple mobilities, practice-based approaches provide a multitude of heuristics that can help trace, pragmatically, how the working world is continuously configured and reconfigured.

By no means are the research traditions presented in this chapter exhaustive of all approaches taken to the study of work and learning. What this entry aims to accomplish is to lay out, in broad strokes, the main contours of research concerning work and learning, giving special attention to the unit of analysis or the imagined site of intervention, and the intended goals of education and learning. Of note, the three traditions of work introduced are not necessarily distinct from one another. For instance, there is no prevention for conventional approaches can be used to help workers inquire into the nature of their working conditions, especially the exploitative social relations that workers need to navigate. Meanwhile, critical researchers should not be surprised if workers do not consider transformative learning or a shift of consciousness good learning at all times. For some people, acquisition of particular instrumental skills might be of more value (at particular times) (Newman, 2012). As well, while social justice and equity are not necessarily the central concern of practice-based research, there is potential for researchers to mobilize practice-based thinking to address the changing forms, means, flows and politics of learning in a world where power works in complex ways.

It needs to be noted that this entry draws on research and literature based mostly on the western context. It is assumed that the issues we related about work and learning in this chapter might also be present in other parts of the world. We assume that this chapter might provide a heuristic for researchers to examine work related issues in other contexts. At the same time, we acknowledge that there is also space for researchers in the west to learn from other places. For alternative work to emerge beyond the existing epistemological horizons, researchers may consider comparing not only issues of work and learning, but also methodologies, and theoretical approaches mobilized in related research between the postindustrial west and the rest of the world.

Introduction

College attendance and graduation have many benefits and are linked to higher income, more civic engagement, and enhanced health (Terenzini et al., 2001). The assumption is that the knowledge attained through formal education will lead to more opportunities and a better life. This has not always been the case, in fact before the 1970s, the Fordism movement and traditional manufacturing was the basis for many to achieve success and happiness in the United States and Europe economies, while educational attainment was not viewed as important as it is today (Boczy et al., 2020). The idea of educational attainment was prompted by the transition from an industrial society, centered in the Fordism movement, to a more technologically driven and international economy (Esping-Andersen, 1999). This transitional period moved the economy away from traditional industry to more information and communications technology (Hope and Martelli, 2019). Additionally, Hope and Martelli (2019) explain,

the information and communication technology revolution and globalization allowed top managers, CEOs, and entrepreneurs to apply their talents to a much wider pool of resources to reach a substantially larger audience than had been possible in previous generations (p. 237).

This technological revolution created a global expansion where knowledge creation and obtainment became the central source for economic prosperity.

Knowledge being seen as an economic tool has been explored through the knowledge economy framework. The term “knowledge economy” was coined by Peter Drucker, an Austrian writer on management, economics, and organizational theory, in his 1969 book, *The Age of Discontinuity*. Knowledge economy can be defined as “an economic system in which the production of goods and services is based principally on knowledge-intensive activities that contribute to a rapid pace of advancement in technical and scientific innovation as well as accelerated obsolescence” (Powell and Snellman, 2004, p. 199). This positions knowledge as a resource and as a production tool used to boost the economy; therefore, the more knowledge obtained, the more likely one may be of use within a knowledge-based society. Drucker (1992) elaborated on the knowledge economy theory in an essay where he connected economic productivity directly to knowledge, stating there was a significant shift underway to what he called knowledge society. Drucker explained that in this new society, knowledge was a more impactful resource than land, labor, or financial income and envisioned a move from a capitalistic society to a post-capitalist society and then to a knowledge society. Through a Drucker lens, the advancement of knowledge is the primary driver of economic success.

This framing of the knowledge economy is a globalized concept that has spread internationally. Advanced democracies in regions such as Western Europe and Asia-Pacific support the belief that the knowledge economy has created a demand for college educated individuals with additional skillsets (Hope and Martelli, 2019). The global demand for college educated individuals further underscores how educational attainment is central to the knowledge economy and how the knowledge economy has become a global framework that shapes policies. Naidoo (2003) explains how national governments are reforming higher education to adjust for postindustrial societies. The preparation for this new knowledge-based society has led to national government policy and research influencers, such as the World Bank and the Organization for Economic Co-operation and Development (OECD), supporting the knowledge economy framework.

The World Bank, home to 189-member countries, relies on the knowledge economy framework and has used it to shape its initiatives (Weber, 2011). In these initiatives, the World Bank (2010) emphasizes four pillars of the knowledge economy: economic and institutional regime, education and skills, information and communication infrastructure, and innovation systems. Weber (2011) explains, “Education and skills in the World Bank schema ... plays a critical role in innovation system since educational institutions and technology incubators connected to universities are often the sources of new technologies, patents, and novel ideas” (p. 2590). Martens (2007) adds the OECD has, “become one of the most significant players in matters of education through soft

tools" (p. 44). It is important to highlight that both the World Bank and OECD are central to the promotion of the knowledge economy globally and those organizations have been incremental in creating dialogue, research and policies that influence how societies are shaped to view the purpose of education. Positioning knowledge as a tool that can be leveraged by individuals for more economic mobility seems promising, but some critical scholars highlight that race must be central to the conceptualizing of any institutions within the United States context.

Knowledge economy through a racial capital lens

Drucker's assumption that formal education in the US would become the key to navigating in a knowledge economy and the pursuit of education would increase economic mobility was correct overall, however scholars highlight that embedded in the ethos of schools and every other facet of the American system is race (Robinson, 1983). To conceptualize the connections between race and systems within America Cedric Robinson, author of *Black Capitalism*, argued that capitalism is racial in its origin which created the social structures in which Americans operate in today. Benson and Dumas (2021) add, "Under the conditions of racial capitalism, capitalist domination is interrelated and mutually constitutive with White supremacist structures and discourses around the differential valuing—and therefore treatment—of human life" (p. 77). Robinson's account of racial capitalism works well in framing the US educational system that was historically built for those who were white and wealthy (Thelin, 2011). Under this condition education within the knowledge economy must be analyzed through the intersections of race and class or risk leaving minority students out of the educational conversation. Robinson (1983) purported that, "the development, organization, and expansion of capitalist society pursued essentially racial directions, so too did social ideology. As a material force, then, it could be expected that racialism would inevitably permeate the social structures emergent from capitalism" (p. 2). Focusing Robinson's argument on education, means that we must acknowledge educational systems are racial and capitalistic structures, which may challenge the linear view of the educational system that was proposed by Drucker.

Using race as an analytic, prominent scholar Jean Anyon (2014) contended education is not linear at all and educational systems reproduce inequalities for low-income minorities. This differs quite differently from Drucker's view in the sense that education does not equal even opportunity for everyone nor does every person experience education in the same way, and that education is not creating a more equal society. While the knowledge economy can be discussed on a global level due to its wide usage, this article will examine the concept of knowledge economy through the lens of the United States, as a case study, while making careful consideration of the global perspective. Furthermore, this chapter argues that the intersections of race and class highlight how US education within the knowledge economy will not always be a linear process for the marginalized and an equity lens is needed when conceptualizing and utilizing the knowledge economy framework locally and globally.

Human capital in the knowledge economy

To fully analyze the knowledge economy a careful look at the theoretical underpinnings is necessary. The theoretical underpinnings of the knowledge economy highlight several theories; however, human capital theory appears to be driving the main discourse on the knowledge economy within the US and globally, with top organizations like the World Bank and the OECD using it in tandem with the knowledge economy to shape practical uses within society (Takayama, 2013; Weber, 2011). Harvard economist Claudia Goldin (2016) explains that the human capital definition centers on the idea that investments in people, such as education, increase workers' productivity and skillsets. This theory relates to the knowledge economy because it highlights the common assertion that the more educated a person becomes the more, they will be desired for their specific knowledge and increase their human capital. Korres (2008) argued that, "a lack of investment in human capital ... prevents poor countries from catching up with rich ones. Educational attainment and public spending on education are correlated positively to economic growth" (p. 714). This connection directly places economic value on knowledge obtained. The connection between human capital theory and the knowledge economy becomes more evident when exploring the assumptions within the theory of human capital.

Human capital theory assumes that investment in education is necessary to acquire skills and training which, in turn, will increase individual capital (Blundell et al., 1999). Tan (2014) adds,

These knowledges and skills will increase his or her productivity in the workplace. This increased productivity will bring a higher salary to the individual since the wage of a person, in the ideal labor market, is determined by the person's productivity. Therefore, people would invest in education up to the point where the private benefits from education are equal to the private cost (p. 413).

This conceptualization of the knowledge economy is being globalized, with organizations indicating that human capital is accumulated by investing in education so that individuals can compete in the new society and poverty can be ended (World Bank, 2018). While the World Bank has aligned their organizational goals around the knowledge economy and has developed a metric system to examine how countries are meeting their practical goals in the knowledge economy, they acknowledge that before and even more so during COVID season, low-income societies, and gender minoritized people are struggling within the knowledge economy (World Bank, 2018). While the World Bank made references to gender minoritized individuals such as women, missing

were also the experiences of sexual minoritized people. Similar, there have been reports that students in the United States who identify as low income, international, and/or racially minoritized have been most impacted by COVID restrictions (Means and Neisler, 2021). These initial findings could explain why knowledge economy and its theoretical underpinnings to human capital theory both have been criticized for lacking a cultural perspective on how people navigate the knowledge economy (Weber, 2011). Connecting this critique to today's time shows the inconsistencies in the knowledge economy regarding minority groups.

The educated and minoritized communities

Drucker's early assertions that knowledge would be valued by society has found substantial support; however, research has shown that when focusing in on minoritized students many are having drastically different outcomes. Research has shown how educational systems still amplify barriers for some low income racially minoritized students in the US. (Ardoin and Martinez, 2019; Park, 2018). Despite this, the Pew Research Center (2018) report that the Millennial and Gen Z generations with the US are the two most educated generations ever, with Gen Z projected to unseat Millennials as the biggest pursuers of college education at fifty nine percent. Additionally, Gen Z is the most racially diverse of any generation with almost half of them identifying as people of color. Globally, the pursuit of education is on the rise as well, with newer generations seeking education at higher levels than previous generations and overall, the world is more college educated than ever before (Roser and Ortiz-Ospina, 2016). In addition, Gen Z is projected as being more likely to pursue education than the labor force within the US (Pew Research Center, 2018). Evident is that, within the US, these past two generations are much more racially diverse. That means that educational institutions, in the US, are projected to see a higher level of minoritized populations. Educational research demonstrates that minoritized students, such as international, low income, students of color, and gender and sexual minoritized individuals face great obstacles in the educational systems (Ardoin and Martinez, 2019; Collins, 1990; Duran, 2018; Park, 2018; Stewart, 2017). This further emphasizes that minorities are struggling in the knowledge economy.

On the surface, the assumptions of the knowledge economy seem to be working accordingly, with knowledge attainment as higher than it has ever been, yet a more critical look paints a picture of inequity. As previously discussed, the knowledge economy is predicated on knowledge attainment, which means educational institutions are paramount to creating a more educated public. Yet, during the process of schooling, in places like the United States, educational opportunity has been marred with inequities revolving around minoritized populations. Scholars have long researched the topic of educational inequity, for example, Patricia Hill Collins (1990), in her book, *Black Feminist Thought*, discussed how American educational systems are configured on racism, genderism, and classist practices and policies. Additionally, she acknowledged that every educational context in the United States is often situated within a macro-level Eurocentric past that has oppressed people of color, women, and poor individuals. Collins's assertions agree with Robinson's (1983) argument that race has permeated all social structures in the US. Given that the knowledge economy is predicated upon educational institutions those who are marginalized are likely to face barriers navigating the knowledge economy. Identities within the US such as race, class, and gender, may not have the same meaning or impact in other countries, however it should be noted that international students are attending US colleges/universities at large rates, and many international institutions are working diligently to shape their institutions and educational policies to be competitive in national rankings (Carey, 2018). This further emphasizes why developing a more critical perspective on the knowledge economy and understanding minoritized individuals within the knowledge economy is essential on a local and global level.

Understanding minoritized individuals and the knowledge economy requires examining the historical legacy of schooling in the United States. Thelin (2011) explained how the American classical college was originally based on the European model, and the purpose of higher education institutions was to educate the elite and religious leaders, which consisted of white male elites. This is also on par with Robinson's racial capitalism in which he argued that before the creation of a capitalistic structure people were being racialized in Europe which fed into today's social structure. If students were not upper-class white men, educational attainment was limited (Thelin, 2011). Central to the knowledge economy framework is that educational attainment is necessary for economic success and prosperity. Yet, from a historical standpoint race and class were two factors embedded in the building of the US educational system which could impact minority student educational experiences. Torraco (2018) highlights that educational inequity is exclusively tied to economic inequity, and for students to obtain an education, they must deal with rising costs which exclusively impedes low-income families. This further emphasizes the intersection between race and class in shaping educational experiences. In the next section race and class will be discussed separately for deep analytic purposes, however the intersection of both identities can be explored to examine theory.

Low income/working class minoritized individuals and knowledge economy

Class structures have long existed in many countries, with much research showing that social class has always impacted educational systems (Ardoin and Martinez, 2019). As previously mentioned, the knowledge economy is predicated on increasing levels of education, and the theory most used in tandem when discussing the knowledge economy, human capital theory, attests that as education expands for individuals so does their access to opportunities (Becker, 1964; Carnevale et al., 2013; Torraco, 2018). However, many findings indicate that low income and wealthy families differ on educational attainment due to the resources available to wealthy students throughout their lives, such as traveling, summer enrichment camps, and special lessons (Dickert-Conlin,

2007; Torraco, 2018). While this highlights some of the personal struggles for low-income individuals, it is necessary to analyze educational systems to better understand the class structures within institutions. While there are promising low-income students who succeed in education, data shows they are less likely to attend college and less likely to succeed toward degree completion (Tsoi-A and Bryant, 2015). Despite those barriers for many low-income students, the Pew Research Center (2015) reported that the enrollment of low-income students jumped from 12% to 20% between 1996 and 2016. These findings indicate that overall, there is a rise in the enrollment of low-income students in colleges/universities. However, upon arrival, many low-income students struggle (Barnwell, 2017), which is why it is worth analyzing.

For example, the myth of meritocracy, that working hard and achieving a higher education always leads to continuing improvement and prosperity is limited for those from lower social class backgrounds who do not have access to the same cultural capital as those from higher social class backgrounds (Demetry et al., 2015; Liu, 2011). In recent decades, these disparities have become more pronounced. This is a critical consideration for individuals from lower SES backgrounds because it exposes how even when trying to achieve and succeed in the knowledge economy, low-income students may struggle within the system itself. Yet despite the disparities within higher education, attending college is still promoted as the pathway to economic prosperity. As students strive through the knowledge economy, they have vastly different experiences based on their identities, such as class and race (Bottiani et al., 2016; Wilkins, 2014). In part this may be due to how many educational systems are more geared toward middle to upper-class students which reinforces class inequities for low-income students (Martin, 2012). This educational system being geared toward those from middle to upper class create challenges for low-income students who often have vastly different experiences due to their social and cultural backgrounds.

Some classic scholars argued that education was far from a consensual space and embedded in the hidden curriculum was classism that shape how students were taught and categorized (Berstein, 1971; Bowles and Gintis, 1976; Bourdieu and Passeron, 1990). Specifically, they explain that working class students were groomed to enter the labor market based on how well they behaved and assimilated to these hidden expectations. Just as many students strive to navigate the educational curriculum, there is also a process by which students learn hidden norms and values of their discipline (Alsubaie, 2015; Margolis, 2001; Karnieli-Miller et al., 2011). Educational institutions not only teach the primary curriculum, but they also inherit the teaching of the hidden social and cultural expectations and norms prevalent in educational systems (Apple, 2000; Margolis, 2001). These expectations, if followed, usually raise the cultural capital of the students, however, there can often be a disconnect between the social and cultural expectations of the educational system and what minoritized students have inherited as their own social and cultural aspects.

Yosso (2005) explains that cultural capital can be passed down based on family ties or school, however, Yosso further explains that cultural capital that marginalized students bring into the educational system may not be valued equally. For example, Anthony Jack (2019) in his book, *The Privileged Poor*, compared the stories of three groups of students from the same elite school to examine the role that cultural capital plays in the ability of students to navigate an elite university. One of Jack's most notable findings was that students of the same low-income background differed completely in their ability to navigate based on the cultural capital they gained from attending a college prep school versus a public school. The students who attended a prep school were able to adapt to the cultural and social expectations easier than the students who didn't attend a college prep school. The students who did not attend a prep school had less cultural capital in elite universities because they had not learned the dominant cultures social and cultural expectation to the same level as the prep school students. That's one example of many that highlights how educational systems can create systems of inequality within the knowledge economy and foster barriers for marginalized students. Additionally, the recent study conducted by Jack (2019) shows the issue of educational inequality has persisted throughout the years and continues to raise concerns. While income is a major issue in education, race is also a major factor that has also been an issue of concern as students navigate the knowledge economy.

Racially minoritized individuals and the knowledge economy

Centering on class is one way to examine the inequities present within the knowledge economy, but researchers have explored how race is also central to understanding the knowledge economy (Park, 2018). Given the rise today in support for the Black Lives Matter and Stop Asian Hate movements, studying how racism impacts students is very important. Park (2018) reminds us that American colleges were once made up of only White men but growing numbers of students of color have drastically changed campuses. Additionally, Park contends "the inequality that stratifies students" pathways to college does not end once classes start" (p. 3). This analysis positions race as a central factor in obtaining the education and skills necessary to compete in the knowledge-based society. Concepts such as social class may be more identifiable globally; however, race is central to certain areas such as the United States and with rising international enrollment it is crucial to understand how race impacts the knowledge economy.

While examining social class may be more common globally, the concept of race is increasingly central in U. S. culture. In fact, the human capital theory used to operationalize the knowledge economy was originally questioned for its racial undertones. Theodore Schultz, a prominent economist at the time human capital theory was being created, explained during a presidential address at the American Economic Association, that people should not be seen as "capital" or property and assets due to the connection that has to slavery (Schultz, 1961). In Becker's book, *Human Capital: Theoretical and Empirical Analysis, with Special Reference to Education*, Becker later admitted that he was also worried about using the phrase human capital due to the predictable critiques it would receive (Becker, 1964). So even with race being central to U. S. society, the theory that many countries abroad have embedded within their policies to promote the knowledge economy has been questioned for its racial and culture implications.

For example, the United Kingdom is facing issues within their educational institutions as they work to analyze how race is impacting their systems of education (Arday and Mirza, 2018). Therefore, the concept of race can become a globalized term that has the power to influence any country, and how it impacts the knowledge economy should be deeply explored.

While progressing through the knowledge economy and obtaining education and skills seems simple, race has impacted how students access education and what they experience when they are admitted to educational institutions (Harper et al., 2011; Kniffin, 2007; Park, 2018). Early research has shown that racially minoritized students tend to attend college at a lower rate than their peers even though their overall enrollment has increased. Additionally, while racially minoritized Black students may be attending college more frequently at predominantly white institutions, they are still very unrepresented in certain majors such as the STEM field (Hurtado et al., 2010). While some have identified a multitude of reasons why STEM fields are known for the underrepresentation of Black students, such as precollege preparation, some researchers have found that racial discrimination in the workplace and toxic racial climates in college to also be a major factor (Lee et al., 2020; Pew Research Center, 2018). Present in these findings are pressing issues that the knowledge economy and the theory of human capital can't account for, such as racial trauma and lack of opportunity given to students based on race. Additionally, even when racial minoritized individuals are given access to new work and economic capital after their obtaining of new education and skills, like human capital theory assumes, they still face problematic work environments. Overall, human capital theory which is the basis for the knowledge economy seems to lack in taking account for racialized spaces and experiences.

Transforming the knowledge economy

While this chapter focused primarily on race and class for the purpose of this chapter it is crucial to reiterate there so many identities that students can carry, and they are all connected to a students intersectional experience. Limpangog (2016) reminds us that years after the impactful work of scholars like Patricia Hill Collins, scholars have expanded the marginalized communities that should be studied, such as those with disabilities, transgender and gender nonbinary people, and trafficked people. For example, if many scholars who study gender remind us of the educational spaces also have a deep problematic history in relation to gender and sexuality (Collins, 1998; Duran, 2018; Johnson and Quayle, 2017; Strayhorn and Mullins, 2012). According to the Association of Governing Boards of Colleges and Universities (Trammel, 2014), there are many LGBTQ students in colleges and universities, yet research on those students is lacking (Duran, 2018). This would mean that there are groups of students navigating the knowledge economy that are often forgotten and their stories are often untold. Lange et al. (2019) explain that many LGBTQ students deal with oppressive collegial environments, yet they are often undiscussed and not included in these spaces. Additionally, Lange et al. highlight how students of color who also identify as LGBTQ may be subjugated to additional oppressive systems, such as racism, genderism, and sexism.

To understand these groups new theories, research, and perspectives must be used to critique and analyze the knowledge economy based on diverse minoritized communities. The knowledge economy and the theory (human capital theory) being used to operationalize its assumptions around the world has been critiqued for its prescriptive and "one size fits all" approach (Weber, 2011). Additionally, it has been criticized for seeing human beings as economic tools and dismissing what it means to truly be a human being (Tan, 2014). Despite these critiques, the knowledge economy and human capital theory have become the dominant discourse around the world and have shaped perceptions and practices regarding education (Tan, 2014). However, when we look at minoritized individuals within the knowledge economy, there are clear spaces where many are marginalized within the society and experiencing additional barriers. Tan (2014) states that majority of the critiques on the theory supporting knowledge economy fail because,

Majority of criticisms directed at HCT are rather tantalizing. These critiques give the impression that they have a better alternative model for education policies. But sometimes it is quite noticeable that these criticisms are mostly driven by an ideological zeal with full of resentment just to attack the dominant school of thought with no present alternative at hand (p. 437).

While this assertion is fair and highlights how human capital theory will likely remain the dominant discourse, it still lacks in understanding minoritized experiences. Society is becoming more diverse than ever so if human capital theory remains the dominant discourse, it is equally important to have additional theories that highlight a demographic of individuals who are coming into colleges at an increasing rate. New theories are necessary to build new perspectives and policy changes for education.

Theories for change

Inequality within education has been a topic that has been long discussed within research. Building on Marx's theories, Pierre Bourdieu once argued that other forms of capital existed outside of just economic. Arguably one of his most used theoretical concepts is his examination of what he called "cultural capital." Cultural capital, as defined by Bourdieu, is a person's knowledge and intellectual skills that provide them with the privilege of achieving higher social status (Bourdieu and Passeron, 1977). In addition,

Bourdieu and Passeron argued that if one was born into a family of higher class they would have access to middle to upper-class knowledge and be able to utilize it to increase their social mobility through formal education. This seminal theory has been used for years to explain why certain groups advance in society and while others fall behind. However, Bourdieu in his best efforts failed to explain the racial and cultural factors associated within this process.

Yosso (2005) extended on Bourdieu's work on cultural capital, however she explained the issue in Bourdieu's explanation is that it looked at marginalized populations from a deficit viewpoint and assumed people from marginalized communities needed to "catch up" to those of middle to upper class. However, Yosso contends that people of color have different cultural tools that should be valued by institutions and not create the perception that people of color have less knowledge. In essence, Yosso flipped the argument toward the inequality and inequity present within the systems of schooling and added race as central to educational systems process of valuing and devaluing certain knowledges (Delgado Bernal and Villalpando, 2002; Ladson-Billings, 2000). Yosso formulated what she called a, "community cultural wealth model" that provides a more asset-based view of what students of color bring to their college campuses and how their own cultural aspects are strengths not deficits. Her work is considered a seminal piece in advancing cultural capital and will be used in this session to highlight how this same framework can be applied to advancement in student affairs for Black professionals and students. Yosso's work is one example how we must advance theories that have shaped the perceptions and views toward educational systems.

A theory that has become increasingly popular is the theory of intersectionality coined by Dr. Kimberlee Crenshaw. Intersectionality is focused on identifying, discussing and addressing the ways that systems of inequity, including sexism, racism and class bias, intersect to produce complex relations of power and (dis)advantage (Cho et al., 2013; Crenshaw, 1991). Additionally, this theory encourages us to consider the context individuals are placed in and the power dynamics present within a given system, such as a school. While intersectionality has been used by some scholars as sole theoretical framework (Davis, 2008), other scholars in fields like public health have used intersectionality as a more analytical framework or paradigm or in tandem with another theory (Bowleg, 2012). This highlights how a theory such as human capital theory can be looked at from an intersectional perspective. While these are only a few examples, it shows how main theories used to shape educational systems and how people view the purpose of education need to adapt as society has changed substantially.

Conclusion

Education was once viewed as the perfect means to solving inequities within society. Horace Mann famously said, "Education, then, and beyond all other divides of human origin, is a great equalizer of conditions of men ... the balance wheel of the social machinery". The idea of a knowledge economy concept was present when the purpose of education was first being conceptualized. However, it is very clear that education is not the great equalizer and that minority students are still experiencing great obstacles as they navigate the knowledge economy. While this chapter could not cover all identities race and class alone show the potential problem with viewing education as linear. This Americanized way of thinking has also shaped education globally and this could create a misunderstanding of how education is viewed worldwide. It is paramount that we produce and use theories that also highlight minoritized individuals and communities so we can better understand their experiences and create safer environments. Additionally, more disaggregated quantitative data is necessary to highlight the many experiences minority students are having. Also, qualitatively there should be a continuous highlighting of minority student experiences. Society and educational institutions are becoming increasingly diverse, and systems of thoughts must shift to meet the needs of the new student demographics. Understanding the future leaders of tomorrow should be on the agenda of every educational system.

Body text

Because education is widely understood to be a central site for the reproduction of society, questions about the content, format, and purpose of education are highly contested. This includes questions such as: What/whose knowledge has value, what is education for, and who should decide?

While the ethical and political nature of these questions (and their answers) are rarely acknowledged in mainstream conversations, Indigenous, decolonial, postcolonial, and critical race scholars have all drawn attention to the ways that education has been and continues to be mobilized to entrench colonial hierarchies premised on white, male, western supremacy and the denigration of Indigenous and other non-western ways of knowing, being, and relating. Following [Sandy Grande \(2004\)](#), mainstream education in the west can more precisely be called “whitestream” education, in that is not only often dominated by white people, “but also principally structured on the basis of white, middle-class experience, serving their ethnopower interests and capital investments” (p. 125).

These scholars also emphasize that while whitestream education (especially western schooling) has often served to reproduce colonial divides, other approaches to education can challenge those hierarchies, mobilize global and social change, and nurture non-western knowledge systems, thereby nurturing other possibilities for existence. Here, the distinction offered by many of these scholars between education and schooling becomes useful, wherein “schooling” is used to describe the specific institutionalized form of education that became dominant first in the industrializing west, and then throughout the world largely through colonial processes and globalizing forces ([Ball, 2012](#); [Rizvi and Lingard, 2013](#); [Spring 2015](#)). Meanwhile, “education” can be understood much more broadly as guided learning toward particular directions, which varies widely depending on the context ([Andreotti and Ahenakew, 2013](#)).

The struggle over the direction and purpose of education is heightened in current debates about the role of education in preparing young people to face today’s many overlapping social and ecological challenges. In particular, there are significant questions about whether education should be a site for social reproduction or social transformation; and if the latter, what this transformation should be and how it should happen. In this text, we contextualize the systemic and historical grounds of these discussions in relation to global and Indigenous education specifically. We draw particular attention to the ways that western schools and universities have entrenched universalizing and Eurocentric knowledge systems that invisibilize or invalidate other knowledge systems, and the people who produce, hold, and embody those knowledges ([Sousa Santos, 2007](#); [Willinsky, 1998](#)). In doing so, we also review the landscape of contemporary efforts to create more space for global and Indigenous education, both in the context of western educational institutions and beyond. As part of this review, we offer a social cartography that seeks to support more generative engagements between different approaches to global and Indigenous education. Finally, we conclude the text by offering a second cartography that emerged from our work in the areas of global and Indigenous education, and that seeks to prepare learners to face the complexity, uncertainty, and plurality of today’s world with maturity, humility, discernment, and accountability ([Stein, 2021](#)).

Before we proceed, we note that there is a paradoxical dimension to any effort to challenge the universalism of western knowledge in educational contexts. On the one hand, it is necessary to at least temporarily center that knowledge in order to critically trace its colonial origins and implications; if we do not do this work of deconstructing Eurocentric frames, then they are likely to be naturalized and reproduced. On the other hand, critiquing western universalism takes space away from engaging other ways of knowing

and being, and their associated forms of education. We have sought to balance both of these imperatives while also addressing head on the complexities that emerge at the interface of different knowledge systems with unequal systemic power, and the common challenges and paradoxes that characterize efforts to include or integrate other ways of knowing into western-centric educational contexts. This text is informed by our different positionalities as a white settler (Sharon), an Indigenous person (Cash), and a racialized immigrant who is an Indigenous descendant (Vanessa), as well as our current geographic location in what is currently known as Canada. Finally, this text is inspired by our ongoing collaborations with each other and many others, especially our work as part of the Gesturing Towards Decolonial Futures Collective. The collective is made up of researchers, artists, educators, students, activists, and Indigenous knowledge keepers who are interested in how we might imagine “education otherwise” in relation to both global and Indigenous education. Rather than try to imagine alternative forms of education from where we currently stand, the collective seeks to develop “alternative approaches to alternatives” (Sousa Santos, 2007) through pedagogical experiments that gesture toward possibilities that are viable, but unimaginable within mainstream institutions. This approach presumes that if alternatives are not to reproduce colonial patterns by assuming a “single path forward” and making harmful projections about the future, then they cannot be predetermined in advance. Rather, they must be collaboratively woven as we move together in the context of relationships premised on trust, respect, reciprocity, accountability, and consent (Whyte, 2020).

Colonial divisions

Knowledge, power, and education have become deeply entangled through the historical and ongoing structures of western colonization. As John Willinsky (1998) writes,

Much of the knowledge achieved through conquest and colonization was understood to legitimate the political and cultural domination of imperialism. The resulting perspective on the world formed an educational legacy that we have now to reconsider. (p. 3)

In fact, Ramon Grosfoguel (2013) argues that western knowledge and thus western education was only able to reach its current position of global hegemony because of the violence that was enacted through European colonialism and slavery, starting in the 15th century. In other words, the *epistemicides* of non-western knowledges were only possible because of the *genocides* of non-western peoples. At the same time, these genocides and epistemicides were accompanied by *ecocides* that were rationalized through western knowledge that framed the earth and “nature” (other-than-human beings) as resources to be extracted for human use, rather than as living entities with whom humans are related and to whom they have reciprocal obligations (Davis and Todd, 2017).

One of colonialism’s most significant educational legacies is the ongoing hierarchical division of the world into two sets of people: those who are deemed the “leaders” of humanity, and those deemed the “followers.” Those designated as “leaders” of humanity are presumed to have the ability and the authority to determine: a universal direction for human progress and change; the legitimacy of knowledge (what counts as legitimate, good, important, normal); the allocation of resources; and the rules of global engagement, among many other things. Generally, this designation is reserved for those who are located in the Global North and/or those who are deemed to be white. Meanwhile, those designated as the “followers” of humanity are presumed to lack the relevant knowledge and capacity for political leadership, economic autonomy, and epistemic and moral authority, and are thus structurally relegated to positions of servitude and subordination. Generally, this designation is imposed on those located in the Global South and/or those who are deemed to be non-white.

This racial and colonial division of humanity has been contested from its very beginnings by those whom it assigns to positions of subjugation. Often in response to this resistance, the exact form of this division has shapeshifted over time and place. Nonetheless, these basic divides continue to naturalize the hegemony of the systems and subjectivities of the supposed leaders of humanity. This includes an economic system rooted in global capitalism, a political system rooted in nation-states, a knowledge system rooted in universal reason, and subjectivity premised on unrestricted autonomy and individualism. Generally speaking, the education system that accompanies these systems supports their reproduction. Collectively, these systems can be said to constitute a “capitalist/patriarchal western-centric/Christian-centric modern/colonial world system” (Grosfoguel, 2013, p. 82), which we refer to throughout this text as the “modern/colonial system.”

The relationship between power and knowledge that characterizes this modern/colonial system is usefully illustrated by Boaventura de Sousa Santos’s (2007) notion of abyssal thinking. Sousa Santos argues that modern western thinking is characterized by an “abyssal line” that divides reality into two distinct parts. On “this side” of the colonial divide is what is real, imaginable, and desirable, while what lies on “the other side” is deemed unintelligible and insignificant, framed as the product of superstition and a lack of universal reason. While this outright dismissal is harmful, even when “this side” of the line acknowledges and tries to access “the other side”, it is often mis-interpreted in ways that are also harmful. For example, western frames of knowledge generally cannot comprehend that other-than-human beings are understood within many Indigenous knowledge systems as teachers (Marker, 2004; Simpson, 2014). This is illustrated in a school strategy document for Indigenous engagement in Canada, which featured a quote from an Indigenous elder telling a story about being chased by a bear up a tree, affirming that this experience made it clear to him how the bear is also a teacher. However, in the document that reported this story, the elder’s account is interpreted as an affirmation of the value of environmental education for Indigenous children and of the need for knowledge about dangerous

animals that can pose a threat to one's safety in natural spaces. In this interpretation, the voice of the elder was grafted onto an anthropocentric (human-centered) ontology in which knowledge is produced and shared solely by humans, nature and culture are separate spheres, and relationships between humans and animals are mediated by human knowledge that is produced for human safety.

Reality on "this [modern western] side" of the abyssal line does not simply ignore, belittle, or mis-read reality on "the other side"; it is structured by the colonial divide itself. "This side" is presumed to hold totalizing, universal knowledge and truth, which is only legible in contrast to its presumed opposite, that is, partial or particular knowledge and truth on the "other side" (of non-western knowledge). As [Ahenakew \(2016\)](#) argues, "The denial and denigration of non-western ways of knowing has been part and parcel of European colonialism and a primary means by which the universality of Western knowledge was asserted" (p. 327). Furthermore, this abyssal line has not only epistemological but also material implications, as the "denial and denigration" of non-western knowledge has been "used as a justification for the dispossession, destitution, and genocide of populations who were perceived to be lacking knowledge of universal worth (but who occupied lands of strategic importance)" (p. 327). Thus, the abyssal line that constitutes western knowledge refuses the equality of other knowledges, and denies the full humanity of the people who hold those knowledges, in a process that [Sousa Santos \(2007\)](#) calls "epistemicide."

The effect of the abyssal line on education, particularly in western schooling contexts, is significant. Not only did imperial worldviews inform western schooling from the outset, but western powers have also imposed western knowledges and educational systems onto non-western peoples in both direct and indirect ways. In what is currently known as Canada, over 150,000 Indigenous children were separated from their families and forced attend to residential schools from the 1880s until as recently as 1996 ([Truth and Reconciliation Commission of Canada, 2015](#)). Residential schools were framed as part of a benevolent "civilizing mission" that would "save" Indigenous peoples from ignorance and religious heresy by assimilating them into white middle-class Christian society; the schools are now recognized as a form of cultural genocide. The first Prime Minister of Canada, John A. Macdonald, told the Canadian House of Commons in 1883, "When the school is on the reserve the child lives with its parents, who are savages; he is surrounded by savages, and though he may learn to read and write his habits, and training and mode of thought are Indian. He is simply a savage who can read and write ... Indian children should be withdrawn as much as possible from the parental influence, and the only way to do that would be to put them in central training industrial schools where they will acquire the habits and modes of thought of white men." Apart from the deep paternalism and western supremacy that oriented residential schools, they can also be understood as part of a wider colonial effort to alienate Indigenous peoples from their ancestral lands, communities, and cultures, and thus, secure the future of settler colonial society on those lands.

Similar schools were created in what are currently known as the United States and Australia. In fact, Canadian residential schools were likely influenced by US boarding schools, first developed by former US Army general Richard Pratt, who famously stated that the intention of the schools was to "Kill the Indian, save the man." This sentiment was echoed in other educational projects throughout the US and its territories, as well as in other colonial contexts throughout the world. For instance, in British colonized India, [Thomas Macaulay \(1835\)](#) wrote, "We must at present do our best to form a class who may be interpreters between us and the millions whom we govern; a class of persons, Indian in blood and color, but English in taste, in options, in morals, and in intellect" (p. 729).

Although these more explicit strategies of colonization through education are increasingly rare, the colonial division of humanity and subtler forms of assimilation continue to structure education throughout much of the world ([Ahenakew, 2016](#)). For instance, many national and global educational reform efforts portray Indigenous and racialized peoples through pathologized and deficit-based framings ([Ahenakew, 2017](#); [Ahenakew and Naepi, 2015](#); [Ladson-Billings, 2006](#); [Tuck, 2009](#)). While often framed as benevolent interventions, these reforms tend to measure Indigenous and racialized peoples against white, Eurocentric norms, thereby re-universalizing western ways of knowing and being, and denigrating other possibilities for education, and existence. This approach is guided by the same colonial divisions that were instituted centuries ago, in which non-white people are presumed to be less developed along a universal, Eurocentric path of human progress led by white people (the "leaders of humanity"). In addition to reproducing racist hierarchies, this framing deflects attention away from the fact that the educational experiences of both dominant and marginalized communities are deeply shaped by systemic inequalities that are rooted in the compounded social, political, and economic impacts of centuries of European colonization and slavery.

Resisting the colonial divide, reclaiming non-western education

As Konai [Thaman \(2008\)](#) writes, speaking of educational reforms that are framed as "transferring" purportedly universal forms of knowledge and education from the Global North to the Global South,

People who participate in these interventions rarely ask: How do people in this community, this place, conceptualize wisdom, learning and knowledge? Nor do they wonder if the values inherent in and propagated by their agendas are shared by the majority of people whose lives are meant to be improved as a result of their intervention. Few even realize the ideological and philosophical conflicts associated with different perceptions of championed ideas, leaving many communities confused and, in some cases, angry. (p. 3)

For as long as western powers have sought to impose and universalize their worldview, many of the communities on the receiving end of this imposition have resisted it (Morreira et al., 2020). In doing so, they have insisted on the need to contest western epistemic universalism and the hegemony of western schooling, and support and sustain educational efforts that center non-western ways of knowing and being (without then assuming that those ways of knowing and being are static or unchanging). Resistance, revitalization, and resurgence efforts in education have been theorized and documented by educational scholars writing from the peripheries of the white, western hegemonic center, including: Black feminist perspectives, such as those of Gloria Ladson-Billings (1998, 2006), bell hooks (1994), Jessica Harris and Lori Patton Davis (2019); Indigenous education scholars, including Eve Tuck (2009), Linda Tuhiwai Smith (2012), and Leilani Sabzalian (2019); those who have critiqued the colonial dimensions of international and global education, like Leon Tikly (2004), Keita Takayama (2018), and Vanessa Andreotti (2011); and various educational scholars of post-colonialism, such as Ashis Nandy (2000), Roland Sintos Coloma (2009), and Riyad Shahjahan (2014), and decolonization, such as La Paperson (2017), George Sefa Dei (2008), and Rubén Gaztambide-Fernández (2012). Thus, while below we review three specific examples of efforts to resist the coloniality of western education and support other educational possibilities, we emphasize that there are countless other examples that we could draw on. These three examples were chosen in order to illustrate a range of possible strategies for resisting and reimagining education, including how these possibilities are shaped by socially and historically situated contexts and analyses.

Our first example is *Indian Control over Indian Education*, a position paper written in 1972 by the National Indian Brotherhood (now known as the Assembly of First Nations) in Canada. As Michelle Pidgeon (2016) notes, the document sought to assert Indigenous peoples' right to determine their own education "across the lifespan (e.g., from early childhood to post-graduate education)" (p. 78). The paper also articulated a specific orienting purpose for Indigenous peoples' education, noting "We believe in education: as a preparation for total living, as a means of free choice of where to live and work, as a means of enabling us to participate fully in our own social, economic, political, and educational advancement" (National Indian Brotherhood, 1972, p. 3). 50 years after *Indian Control Over Indian Education* was published, Indigenous peoples in Canada and elsewhere are still pursuing diverse strategies to secure access to forms of education that "center Indigenous knowledge as the source for content, curricula, and pedagogy" (Pidgeon et al., 2013, p. 28).

Indigenous communities have for centuries sustained Indigenous educational practices in the face of colonial efforts to eradicate them. As Leanne Simpson (2014) argues, it is not necessary to entirely forgo western schooling in order to emphasize the importance of Indigenous forms of education. Yet, she also asks, "Don't we deserve learning spaces where we don't have to address state learning objectives, curriculum, credentialism and careerism, where our only concern for recognition comes from within?" (p. 23). Indeed, Indigenous peoples and communities often relate to education in layered ways that are always shaped by the larger colonial context. In some cases, they focus on interrupting the coloniality of whitestream schools and carving out Indigenous spaces in those institutions. In other cases, they focus on reinvigorating land-based Indigenous educational practices that exceed what is possible within western schooling. While these strategies might appear on the surface to be contradictory, Indigenous peoples' approaches to education are shaped by a paradoxical set of imperatives: the practical imperative to survive within western societies that are based on an unsustainable single story of human progress achieved through social-economic accumulation that treats the earth as a resource to be exploited; and the existential imperative to keep alive alternative possibilities for noncapitalist existence based on reinvigorated ancestral ways of knowing and being that recognize the earth as a living entity and relation (Ahenakew, 2016). This paradox is further heightened in the context of contemporary social and ecological crises, including climate change and biodiversity loss, political instability, and economic austerity and precarity. In this context, the crises and potential collapse of our existing system only heightens the importance of sustaining alternative possibilities. At the same time, those possibilities have become sites of extraction and appropriation for non-Indigenous peoples and corporations seeking to reinvigorate that system using the commodified knowledges and practices of Indigenous peoples, for instance in relation to sustainable planning practices and plant medicines (Whyte et al., 2018).

Our second example of resistance to whitestream educational norms comes from Manish Jain's (2013) writings about global education. Jain critiques the UNESCO "Education for All" campaign, suggesting that it is more accurately described as "McEducation for All" as it imposes a western, capitalist approach to education onto the non-western world as if it were the only viable option. He argues that Education for All "tells us that we must all walk on a single, universal, linear, standardized path of education and development, which is dictated by the logic of the industrial-military system" (p. 85). He suggests that while education is often framed as the solution to many contemporary problems, dominant forms of education are in fact the root of many of these problems. Jain advocates for an approach to global education that supports efforts to "reclaim and revitalize what is commonly called 'informal education', basically all of the natural learning that happens in everyday life that does not fit neatly into institutionalized categories of formal and non-formal education" (p. 84). In his own practice, Jain seeks to reinvigorate informal education in India through his involvement with Swaraj University, which he identifies as "India's first gift culture university dedicated to regenerating the local economy, local culture and local ecology" (pp. 89–90).

Swaraj can be understood as part of the larger global deschooling movement, which seeks to reclaim education from its institutionalized, and especially westernized, forms. This includes the Ecosities Alliance, of which Swaraj is a part, which seeks to reimagine higher education by asking "What might the university look like if it were at the service of our diverse ecologies, cultures, economies, spiritualities, and Life within our planetary home?." Jain (2016) has articulated a "Declaration of Decolonizing Education" to help orient this work, which includes the following statements:

I can no longer accept a narrative of education, which teaches me that my village grandmother was illiterate, primitive, backward, stupid, uneducated, underdeveloped, uncivilized and not capable of managing their own affairs.

I can no longer accept a narrative of education that sees my links to my land, to my local languages, to my seeds, to my rivers, to my trees, to my histories and herstories, to my body, to my inner voice, to the spirit world, to my community all as a barrier to modernization and development which must at best be destroyed if we are to progress, and at worst be condemned to a multicultural day festival in school.

I can no longer accept a narrative of education that teaches me that physical work in the fields, in my home and in my community is drudgery and my children's definition of "happiness" lies in drinking Coca Cola, eating at McDonalds, using Fair and Lovely face whitening creams and chatting on Facebook.

I can no longer accept a narrative of education that teaches me that I have to compete against others in my community and against peoples from other countries to survive.

I can no longer accept a narrative which teaches me that learning is a commodity (along with the air, water, land, food) and that knowledge is the property of individuals through copyrights and patents.

In our third and final example, [Django Paris and H. Samy Alim \(2014\)](#) write about the importance of "culturally sustaining pedagogies" (CSP) that decenter white middle class norms of educational achievement, and "foreground the heritage practices of community of color", while also "taking into account contemporary/evolving community practices" (p. 85). CSP is rooted in what Paris and Alim call "asset pedagogies" that have sought to position "the linguistic, literate, and cultural practices of working-class communities – specifically poor communities of color – as resources and assets to honor, explore, and extend" (p. 87). This approach seeks to both refuse the pathologization of non-white communities, and the denigration of their knowledges, but also to specifically challenge the notion that equity in education is equivalent to getting "working class students of color to speak and write more like middle-class white ones" (p. 87). [Ahenakew and his colleagues \(2014\)](#) raise similar concerns. While affirming the contingent importance of inclusion-based efforts to address colonization in whitestream institutions, they warn that "if we try to provincialize Western thought within the institutions (e.g. nation-states, universities, schooling, etc.) that were created to naturalize it, we will need to remain within its language, epistemology and ontology, even when we claim to be doing the opposite" (p. 220). This points to the complexities and tensions arise within and between different approaches to engaging global and Indigenous education in the context of whitestream institutions.

Different approaches to global and Indigenous education

In many whitestream educational institutions, there is growing interest in incorporating global and/or Indigenous perspectives into curriculum, pedagogy, and institutional culture. Often, these institutions are seeking to restore or maintain their perceived benevolence and relevance in response to public critiques about their whiteness or Eurocentrism. While this has presented important opportunities to denaturalize and decenter western knowledge, it has also raised considerable complexities and tensions in practice. In particular, Indigenous and other non-western knowledges are often engaged in selective, tokenistic, and decontextualized ways that do not disrupt business as usual; meanwhile, critiques that challenge the presumed benevolence, universality, and continuity of the modern-colonial system are generally excluded or minimized.

One way of considering how educational institutions incorporate global and Indigenous perspectives is to ask how they approach changes to the modern/colonial system that, up until now, has largely excluded and invalidated these perspectives within formal education. Approaches to change can range from thinking that the system is working optimally as is, to thinking that the system has a good structure but requires some degree of revision or "reform," to thinking that the system is so fundamentally flawed that it cannot possibly be reformed and ultimately we will need a different system, or set of systems, in its place. In this section, we review four different approaches to reform.

In many whitestream schools and universities, there is still no perceived imperative to rethink educational practice or reform the modern/colonial system (i.e. *no reforms*). Increasingly common is an approach that presumes that this system requires *minor reforms*, such as small policy shifts and curriculum changes. Others suggest that *major reforms* are needed in order to center non-western perspectives and redistribute resources to marginalized students, researchers, and communities. Still others argue that these institutions might ultimately be unable to transform their colonial foundations, and therefore are *beyond reform* (see [Andreotti et al., 2015](#)). In order to consider the possibilities and limitations of each of these approaches, in the remainder of this section we present a social cartography of four different approaches to education, emphasizing how each approach engages the modern/colonial

Table 1 Different approaches to education in relation to the modern/colonial system.

	<i>Education for system maintenance (no reform)</i>	<i>Education for system expansion (minor reform)</i>	<i>Education for system transformation (major reform)</i>	<i>Education for system hospicing (beyond reform)</i>
Purpose of education	Transmit knowledge and values to ensure the reproduction of the modern/colonial system	Expand access to the modern/colonial system, and ensure wider participation in its improvement	Empower learners to organize in pursuit of greater social, political, and economic justice	Prepare learners with the capacity to face complexity and uncertainty with maturity, humility, discernment, and accountability
Approach to knowledge	Western knowledge is universally valuable; other knowledges are insignificant	Western knowledge is universal, but should be supplemented by local knowledges	Western knowledge should be decentered, non-western knowledges should be centered	All knowledges are partial, situated, and have contextual (rather than universal) relevance
Approach to global education	Developing cultural competencies and global awareness in order to foster good diplomatic and business relations, and competitive advantages	Facilitating inclusion in and informed engagement with institutions to promote global peace, equality, empathy, mutual understanding	Fostering advocacy for and political solidarity with historically and systemically marginalized populations against systemic global injustice	Engaging with the complexities, paradoxes, uncertainties, difficulties of social and ecological challenges without seeking simple solutions, and without allowing complicity in systemic harm to disappear from view
Approach to Indigenous education	Indigenous knowledge has no proper place in the context of western schooling; Indigenous peoples should adapt to existing institutions	Select elements of Indigenous culture can be used to support Indigenous success and foster non-Indigenous empathy	Indigenous education should be implemented in ways that center and prioritize Indigenous self-determination and sovereignty	Indigenous peoples have a right to determine their own education; Indigenous education has much to teach non-Indigenous people
Imaginary of hope and justice	Through continuous innovation we will increase efficiency, effectiveness and competitiveness of existing educational institutions	Through small, consensus-based changes to policy and practice, we will ensure continuous improvement to existing forms of education	Through collective action, we will radically transform the existing educational institutions to work for more people, and enact redress for harm	We need to hold space for “education otherwise,” that is, education outside of what is currently imaginable within the modern/colonial system
Theory of change	Human rationality and ingenuity will enable us to engineer system continuity even in the face of change	Prepare more informed and engaged citizens and workers to adapt in face of disruption	Exposure to critiques of inequity will lead people to transform their values & actions	The limits of the current system will compel us to consider other possibilities for knowing and being
Example	Common Core State Standards Initiative	UNESCO Futures of Education Initiative	<i>Indian Control over Indian Education</i>	The University of the Forest

system (i.e. no, minor, major, or beyond reform), how each approaches global and Indigenous education in particular, and examples of each (summarized in [Table 1](#)). Readers might also wish to revisit the three examples of resistance to whitestream education reviewed in the previous section, and consider where they would place each example in relation to this cartography, noting that some might fall at the interface of different approaches.

Social cartographies are not meant to offer a comprehensive representation of reality, but rather to highlight tensions and contradictions and to make visible perspectives that are being erased. Further, positions in a cartography are not meant to indicate static stances or identities, as one's approach might shift from one context to another depending on what is possible and legible. As thought experiments, cartographies invite readers to think *with* rather than *about* them, and prompt the possibility of dynamic movement without directing people toward a particular end. For instance, in relation to this cartography of education, we invite readers to consider: What are the assumptions behind each position? What does each position enable and preclude, and what does each position invisibilize in order to maintain its own coherence? What other approaches might be missing? How can we engage in generative conversations across these different perspectives?

An approach to education that seeks *system maintenance* emphasizes the need to ensure the continuity of “business as usual,” including ongoing innovation to engineer increased efficiency and effectiveness. Ultimately, education is understood as a means to reproduce the modern/colonial system as is. In this approach, western knowledge is understood to be universally valuable and relevant, regardless of the context. The approach to global education from this position emphasizes the development of cultural competencies that can enable good geopolitical diplomacy, secure strategically important international business relationships, and maximize individual and national economic competitiveness. The approach to Indigenous education from this position sees little value in Indigenous ways of knowing and being, and no place for them within whitestream educational institutions; it is presumed that Indigenous people should integrate (assimilate) into dominant society, apart from perhaps preserving a few cultural traditions in their own spaces. Alongside system expansion, system maintenance is probably the most widely accepted approach to education in the context of whitestream institutions.

Education based on *system expansion* generally assumes that minor reforms to the current educational system are all that is required, with the goal of spreading the perceived gifts of western knowledge and education as widely and democratically as possible. Thus, this approach seeks tweaks to policy and practice that expand access to this knowledge and education. Global education from this position is focused on fostering peace, equality, and mutual understanding, while Indigenous education is approached as a means to supplement western knowledge with elements of Indigenous culture in order to both support Indigenous communities to succeed in whiteman institutions, and support western students to develop empathy for Indigenous communities. The result is that Indigenous knowledges are selectively engaged and approached through the frames of western knowledge and white middle-class sensibilities, rather than on their own epistemological and ontological terms (Ahenakew, 2016). Ultimately, this approach to education does not decenter western knowledge, challenge western paternalism, nor question the desirability of the continuity of the modern/colonial system.

A *system transformation* approach to education actively seeks to decenter western knowledge, and often seeks to center non-western knowledges in its place. There is a commitment to developing forms of education that can support learners to transform the world toward greater justice, especially in ways that center the needs, perspectives, and knowledges of marginalized peoples. Global education is framed as an opportunity to foster solidarity between communities across differences and in pursuit of systemic changes, shifting power relations, and redress for historical and ongoing injustice. Indigenous education in this approach should center the needs and priorities of Indigenous communities; whether this happens in formal institutions or alternative educational contexts is secondary to the question of whether or not it supports Indigenous peoples' political and intellectual sovereignty and self-determination. This approach to education is generally dismissed within whiteman discussions and institutions, although it might be granted space at the margins.

Finally, a *system hospicing* approach to education suggests that while reforms to existing institutions might be important in the short-term, ultimately, these institutions are rooted within a modern/colonial system that is inherently violent and unsustainable. From this analysis comes the understanding that we need a form of education that can prepare us to face the possible end of the existing system – that is, to “hospice” it – and create space for something else to emerge in its place. The metaphor of hospicing derives from a sense that our current modern/colonial system is dying, and those of us who are part of this system have a responsibility to support it to “die well”. This support entails learning from the system's gifts as well as its many mistakes, and cleaning up its messes (including working to redress the harm it has caused). Hospicing is different from efforts to place this system on life support through various reforms, or efforts to force its end prematurely. The work of system hospicing is also accompanied by the work of “midwifing”, or supporting the birth of something different. Education from this approach emphasizes the indispensability and insufficiency of all knowledges, while noting that Indigenous and other non-western communities have much to teach western communities that exceeds what is currently taught in western education. However, it cautions that these engagements will reinscribe the abyssal line if they do not interrupt extractive, appropriative, and tokenistic modes of relationship, and instead operate from consent, reciprocity, and respect (Whyte, 2020). Thus, in relation to both global and Indigenous education, this approach to education emphasizes the generative possibilities that can emerge at the interface between different knowledge systems, as well as the potential to reproduce colonial patterns at this interface. This approach to education is not only marginalized within whiteman institutions, but also challenges existing epistemic frames to the extent that it is largely unintelligible to many within them, which is why we have offered an extended engagement with it here. Given that both hospicing and midwifing are complex, difficult, and at times painful processes, this approach to education is generally of most interest to those who have reached the limits of various efforts to reform the modern/colonial system, and are thus open to learning (and unlearning) that asks questions with no clear answers and invites deep inquiry with no clear solutions or end point. Rather than transmitting specific content or prescribing a pathway to a predetermined end, an education rooted in system hospicing supports learners to develop the maturity, humility, discernment, and accountability that they will need in order to sustain hospicing and midwifing work in the long-term.

Global and Indigenous education in the context of emerging challenges

The current landscape is characterized by numerous overlapping social and ecological challenges, including climate crises and biodiversity loss, economic austerity, precarity and instability, mental health crises, global health pandemics, social fragmentation, political polarization, and more. We conclude this text by asking what kind of education could prepare learners to face these challenges in generative ways. In this, we are inspired by Zygmunt Bauman (2000), who over 20 years ago described education as “preparation for life.” Without prescribing a single approach to this preparation, we propose some provisional possibilities based on our own research and practice.

Education, in its different modalities (formal schooling, higher education, informal education, alternative education, etc.), has historically been tasked with steering learning toward ensuring continued human survival as well as the reproduction of cultural norms and ideals. However, this double mandate becomes paradoxical when the reproduction of dominant cultural ideals poses a threat to human survival. This paradox is illustrated by Luis Prádanos (2020), who asked, in a recent piece about the future of education: “[I]s it really smart to educate people to technologically and theoretically refine a system that operates by undermining the conditions of possibility for our biophysical survival?” Prádanos argues that it is unwise to approach education in a way that presumes the continuity of our existing system, because the continuation of that system will ultimately cause us to exceed the limits of the planet. In addition to questions of ecological unsustainability, we face enduring challenges that are rooted in the historical and ongoing maintenance of a modern/colonial system characterized by a Eurocentric and anthropocentric hierarchy that

legitimizes violence against both humans and other-than-human beings. Thus, we add to Prádanos's inquiry another question: Do we really want to educate people to technologically and theoretically refine a system that is sustained through colonial violence?

As the limitations of our existing system and its educational institutions become increasingly evident, more people are seeking out educational alternatives. Some of those experimenting with these alternatives are oriented by a system transformation approach to education, while others are oriented more by a system hospicing approach, or an intention to skip the hospicing altogether and jump right into a predetermined replacement system. Some of these efforts can be considered alternative approaches to education, while a few might be "alternative approaches to alternatives." In other words, these educational alternatives are oriented by different desires, investments, and horizons of hope, and thus, it is unlikely that we will arrive at a coherent alternative educational vision. Indeed, we suggest that a single vision is undesirable, as it would lead to implementing a new totalizing universal in place of the old, and suppressing dissenting voices in the process. However, we close this text by inviting readers to sit with the following question: What approaches to global and Indigenous education could enable us to stay grounded and accountable in the face of unprecedented and unpredictable change, and respond to whatever arises without becoming overwhelmed, or immobilized? We offer one partial, provisional answer to this question through another social cartography that outlines a set of basic dispositions that might orient us away from forms of education that are premised on the reproduction of the enduring colonial divide that characterizes western-centric schooling, and toward forms of education that foster a deepened sense of responsibility for shared existence on a finite planet, across species and across generations.

The "In Earth's CARE" framework emerged through our transnational collaborations with Indigenous communities in Canada, Peru, Mexico, and Brazil (Stein et al., 2020). In this way, it can be understood as relevant to both global and Indigenous education. This framework is informed by alternative economies and ecologies, Southern epistemologies, and initiatives that highlight the importance of teachings from grassroots resistance and land-centered movements, including Black, Indigenous, landless, peasant, and Quilombola struggles. This pedagogical framework was produced with an intention to identify the limits of the modern/colonial system without overdetermining what an alternative system, and attendant forms of education, might look like. It proposes a set of dispositions for a pedagogy of everyday life organized around five dimensions of well-being that are represented in the acronym of the framework: E – Ecological; C – Cognitive; A – Affective; R – Relational; and E – Economic. We review these below:

Ecological well-being

- Enabling education from a space where humans are not separated from the land/planet;
- Grappling with the complexities of addressing differential complicities in ecological harm;
- Reflecting on the challenges of shared existence on a finite planet from different perspectives, including those of other-than-human beings; and,
- Developing resiliency for the slow and challenging work that needs to be done in order to address the accumulated effects of centuries of ecological destruction.

Cognitive well-being

- Thinking in multiple layers to face and embrace complexities, tensions, and paradoxes at the interface between different knowledge systems;
- Connecting dots in the bigger picture to understand how different struggles are connected;
- Examining the different layers of our systemic complicity in harm in deeper ways; and,
- Making space for and relating differently to the unknown and the unknowable.

Affective well-being

- Learning to hold space for internal complexities and contradictions;
- Developing the capacity to be uncomfortable and to accept uncertainty and internal contradictions without becoming irritated, overwhelmed, or immobilized;
- Identifying and starting to unravel projections, fears, (in)securities, anxieties, and perceived entitlements at individual and collective levels; and,
- Nurturing a sense of responsibility that is not dependent on choice, convictions, or convenience.

Relational well-being

- Developing stamina to engage with difficult issues and conversations without relationships falling apart and without investments in harmful continuities;
- Exploring possibilities for relating not grounded on shared meaning, identity or conviction;
- Experiencing the difficulties and complexities of ethical engagements and solidarity from a space of accountability; and
- Learning collectively through difficult events with humility, generosity and patience.

Economic well-being

- Identifying and interrupting patterns of consumption (of knowledges, experiences and relationships) as a mode of relating to the world, in order to give and receive differently;
- Decentering one's desires and centering collective needs by committing to do what is needed rather than what one wants to do;
- Challenging patterns of entitlement coming from social, economic and/or racial hierarchies; and
- Learning to practice economies based on abundance, reciprocity, and redistribution, rather than self-interest or utility maximization.

In this text we have sought to identify the historical context and ongoing conditions that shape both global and Indigenous education. In addition to identifying a modern/colonial system that shapes dominant forms of education, especially in the context of western schooling, we have examined different efforts to critique and reform these forms of education. We suggest that in light of today's many emerging, overlapping social and ecological challenges, there is a need to consider the gifts and limitations of each of these and other approaches to education. We have particularly emphasized forms of education that are rooted in and/or inspired by Indigenous and other non-western knowledge systems, and that gesture beyond investments in the continuity of the existing modern/colonial forms of education. These approaches are often marginalized in whitestream schools and universities, and indeed are even dismissed as unintelligible due to the abyssal line that invisibilizes anything that is not articulated within and affirming of western values and frames. However, as the continuity of the modern/colonial system becomes increasingly uncertain, the imperative to create space for other educational possibilities becomes increasingly evident.

Acknowledgment

We would like to acknowledge that this text was completed on the traditional, ancestral, and unceded territory of the Musqueam people. We support the struggle of the Musqueam people, and all Indigenous peoples, to have their lands returned to them. This text was made possible through the funding of the UBC Hampton Fund Research Grant, "Challenges and Complexities of Decolonizing Higher Education: A Global View", the SSHRC Insight Grants, "Re-imagining Aboriginal Education for Shared Futures" and "Ethical Social Innovation for Decolonial Global Futures", and the SSHRC Insight Development Grant "Towards the Ethical Integration of Different Knowledge Systems: Lessons from STEM and Health Fields."

When we recently did a quick google search on “world university rankings,” over 250 million sites emerged. On top of this list, we found global university rankers’ websites, such as *Times Higher Education’s World University Rankings (THE)*, *QS’ World University Rankings*, *US News World Report’s Best Global Universities Report*, *Shanghai Ranking’s World University Rankings portal*, and so on. Other sites that emerged were university websites highlighting their rankings performances, such as, “Texas AandM Rises In World University Rankings, Now In Top 4%”, or “QS ranks MIT the world’s No. 1 university for 2020–21”, and “U of T ranked among world’s top 25 universities in latest QS World University Rankings.” We also found links to various news media outlets, like the British Broadcasting Corporation (BBC) reporting that “Oxford top of global university rankings,” or the Malaysian New Straits Times, noting that “Malaysian research universities in top 200 of QS World University Rankings.” Given the huge coverage of university rankings across mass media globally, including institutional websites, news media, and social media (Stack, 2016), it’s not surprising that the phrase “world university rankings” has produced over a quarter billion hits in our google search. But, why do university rankings get so much notice? What informs our curiosity and dependence on them?

Over the past two decades, global university rankings (GURs) have received unprecedented attention from so many higher education stakeholders, ranging from policy makers and scholars to parents, students, and the general public. In our own personal interactions with higher education (HE) stakeholders across the globe, including North America, East Asia, South Asia, Central Asia, Latin America, and/or Africa, the topic of global university rankings always surfaces. It seems like a privilege for those who can ignore it (Sauto-Otero and Enders, 2017). GURs introduce new complex dynamics to higher education policy and governance, and the effects of these processes are various and context-dependent.

Since the emergence of the Academic Ranking of World Universities (ARWU), the first GUR in 2003, there has been a growing robust literature on global rankings in the past decade. Other GURs include the Times Higher Education World University Rankings (THE), the QS World University Rankings (QS), and U-Multirank among others. This literature includes discussions of GURs’ methodological limitations, GURs’ impact on faculty, institutions, policy makers, and studies on how GURs influence institutional decision making (Erkilä, 2014; Hazelkorn, 2018; Lo, 2011; Stack, 2016; Yudkevich et al., 2015). Taken together, this work has provided a rich analytical and empirical description of the rise and impact of GURs on higher education institutions (HEIs) in the context of globalization.

Considering the above GUR trends and scholarly debates as the wider context, this article provides a critical overview of GURs, using a geopolitics of knowledge (GoK) lens (Mignolo, 2011). More specifically, we will first illuminate what we mean by GoK and how it applies to GURs. We next highlight and introduce three major university rankings that have had a significant global impact, such as ARWU, THE and QS, also considered the Big Three in global higher education (Stack, 2020). Using the existing literature, we then highlight how these three rankings perpetuate GoK. We illuminate two ways in which GoK manifests through GURs, such as (a) projecting universality of quality and excellence, and (b) reproducing colonial knowledge/power relations. We argue that critically examining the GoK underlying GURs is integral to articulating and challenging the global politics of knowing and being in contemporary HE. We suggest that to achieve diversity and global justice in education, we need to challenge and address the global politics of knowing and being by a) tackling the colonial knowledge/power relations and b) denaturalizing the terms of existence framed by modern/colonial ways of being informing the principle of rankings.

What is geopolitics of knowledge (GoK)?

We draw foremost upon Walter Mignolo’s (2003a, 2011) GoK to frame our analysis. GoK signifies how all knowledge systems originate in geographic and social contexts and are situated within historically and transnationally constituted power relations. Mignolo noted that “local histories are everywhere but ... only some local histories are in a position of imagining and implementing global designs” (Delgado et al., 2000, p. 8). Geopolitics of knowledge is derivative of ongoing coloniality—an ongoing logic of

domination underlying imperial powers (whether Spanish, Portuguese, British, and, later on, American) and a Eurocentric process of expansion of knowing, being, and representation (Mignolo, 2011). Furthermore, coloniality and modernity are constitutive of each other: there is no modernity without coloniality. We use GoK in the HE context in two ways.

First, by GoK, we refer to a set of knowledge/power relations privileging a certain gaze or representation of the world deemed universal, delocalized, and applied unquestioningly. Here, we will demonstrate that GURs reflect and perpetuate an epistemic gaze (i.e., criteria of rankings, quality higher education, etc.) that originates in geographic and social contexts. Yet, the positionality of the epistemic gaze is simultaneously rendered invisible by its worldwide normalization (Mignolo, 2003a). Modern epistemology has thus perpetuated coloniality by delocalizing and detaching its concepts (e.g., rationality, logic, and epistemic virtues) from local histories and presenting them as applicable to everyone (Mignolo, 2003b; Smith, 1999). In terms of our analysis, this means that only certain local knowledge systems, always already derivatives of particular historical-material conditions, have the social privilege to shape global thinking. For instance, the GoK continues in contemporary higher education, as the “Westernized” university and liberal arts models have taken root across the globe (Godwin, 2015; Grosfoguel, 2013; Mignolo, 2003a), and Americanized global templates enfolding concepts of autonomy, competition, and markets are transmitted and assimilated across the globe (King, 2009), even if the ways they are taken up are influenced by context. Similarly, transnational actors, like W.B. (World Bank) or OECD (Organization for Economic Cooperation and Development), perpetuate GoK through their epistemic activities as they perpetuate a “policy by numbers” culture—representations of policy realities through performance indicators (Rizvi and Lingard, 2010)—as they introduce their policy ideas and numbers to policymakers (Shahjahan, 2016).

As we will demonstrate, GURs embody a quality assurance culture derived from Anglo-European knowledge systems, which becomes a global template in the GoK (Lewis, 2009; Shahjahan, 2013). We demonstrate how GURs privilege and valorize templates (i.e., globally competitive HE institutional models, policy by numbers, and discourse of quality) that derive from historically epistemically privileged positions, thereby reproducing GoK. The installment of ranking criteria and language (albeit modified) continue to perpetuate GoK as they are viewed as universal or objective recipes.

Second, we draw on a GoK lens to unearth and signify the “geopolitical configuration of the world” (Mignolo, 2011, p. 118) informing existing hierarchical knowledge systems (e.g., institutional types, disciplines, and languages), and the psycho-social dynamics that feed the desires for emulating metropolitan centers of knowledge (e.g., subjectivity). According to Frantz Fanon (1968), those have been historically allocated in the zone of non-being (i.e., marginalized or considered sub-human in the Global North or South) are forced to emulate those in the zone of being, just to be or belong, which, in turn, legitimates the being-ness of those in the zone of being. Similarly, as Ashis Nandy (1983) reminds us, the coloniality of knowledge “perpetuates itself by inducing the colonized, through socio-economic and psychological rewards and punishments, to accept new social norms and cognitive categories” (p. 3). Within the GoK, those who occupy zones of being have the epistemic privilege to articulate global designs (Shahjahan and Morgan, 2016). Yet, privileged epistemic centers of knowledge also comprise privileged institutions within peripheral¹ zones, such as the University of Cape Town in South Africa or Nazarbayev University in Kazakhstan.

GoK facilitates the production of ranking subjects (i.e., institutions, policy makers, academics and students) who internalize, assume, and take for granted coloniality of knowledge (i.e., dominant knowledge systems) as neutral, superior, and good for everyone, as it colonizes their ways of knowing and being. GoK thus plays out as peripheral nations, HEIs, faculty, and students (who previously occupied zones of non-being), mimic (albeit differently) the characteristics inscribed within the GURs criteria, to enter the competition even if many have no chance of winning. GURs and the templates that go with it thus gains legitimacy and reach via peripheral players’ desire for belonging in an international community and desire to gain epistemic privilege (Shahjahan and Morgan, 2016). In this regard, peripheral players reinforce the universality of “university rankings” as a means to assert their competitiveness and strive for the opportunity to attain global stature (Ntshoe and Letseka, 2010). GURs offer subjects an orientation, or a path, that is “followed by being created and are created by being followed. The more people follow the path, the clearer it becomes, the easier it is to follow”, thus narrowing the “set of possibilities” (Schmitz, 2014, p. 103). GoK helps us go beyond colonial epistemes, to articulate and challenge why HEIs, nation-states, faculty, and students, particularly from zones that are marginalized, nevertheless willingly join this “rankings” academic olympiad. Overall, centering the GoK lens shifts attention from knowledge itself to, who, when, why, and where knowledge is produced (Mignolo, 2011), which is why we next situate the Big Three GURs and answer these W questions.

Brief overview of the big three GURs

ARWU

ARWU, also known as the Shanghai Ranking, was created by Shanghai Jiao Tong University (SJTU) in 2003 as part of the government’s “985” Project to encourage Chinese universities to pursue world-class status. ARWU commenced by Professor Nian Cail Liu, a chemistry professor at SJTU, to achieve an aim “to supply a benchmark to measure China’s progress in the university arena” (Stack, 2016, p. 34). To compare Chinese institutions to the “world-class universities” in the US and worldwide, ARWU developers used Euro-American-centric data and categories in which US research universities stand out as proxies of excellence (Ordorika and

¹By peripheral zones or players, we are referring to those geographic regions and actors, usually former colonies or colonized subjects marked by underdevelopment or cultural differences (i.e. “low-middle income country” or “developing economy”), who continue to experience the brunt of coloniality, leading to large inequities and are allocated at the margins of knowledge production due to colonial epistemes, leading to epistemic dependence (Mignolo, 2002; Grosfoguel, 2002).

Table 1 Global university ranking criteria.

Lloyd, 2015), such as publications in English, number of Fields Medals and Nobel Prize winners, and publications in Science and Nature (see Table 1). ARWU currently publishes four types of rankings to meet diversified needs for the global comparison (see Table 2). The administrative operations today are provided by Shanghai Ranking Consultancy that defines itself as a fully independent organization focused on higher education information with authority to publish and copyright. Initially developed for the Chinese context to build world-class universities, ARWU lacked a specific audience (Lim and Oeberg, 2017). ARWU's primary focus was on universities and government policymakers (Stack, 2016). The Center for World-Class Universities, housing ARWU, provides consultancy services for governments and universities (Downing and Ganotice, 2016). ARWU has organized information sharing and network facilitating services through the Annual International Conference on World-class Universities since 2005.

THE

Since the company's beginning in the UK in 2004, THE was a subsidiary of TES Global, a UK digital education company focusing on student placement services and recruitment with a focus on MBA programs (Stack, 2013). Most recently, TES Global's owner, TPG Capital, a US private equity firm, sold THE to Inflexion, a UK private equity firm (THE Reporters, 2019). Despite the change in corporate structure and ownership, THE's mission remains the same: to "help the world's universities achieve excellence" (THE, 2019). To do this, a primary operation is ranking universities around the world. THE's first ranking, the QS-THES ranking, was a collaboration between QS and THE. After disagreements on methodology, when QS methodology favored the sciences, and their reputation survey was highly problematic, the two rankers split in 2009, and THE began producing its own World University Ranking (Stack, 2016). Now, THE offers world, regional, subject, teaching, and impact rankings (THE, 2019). In 2014, THE ended its partnership with data-supplier Thomson Reuters and has since used Elsevier as their supplier of ranking data (Hanafi and Boucherie, 2018; THE, 2014). THE provides 12 types of rankings to meet diverse needs for global comparison (see Table 2). THE also offers other HE products and services oriented toward senior academics and sector "thought leaders," including news media, hosting conferences, branding, and data analytics (Lim and Oeberg, 2017; Shahjahan et al., 2020, 2022). THE consultancy provides strategic, data-driven guidance to universities and governments globally.

QS

QS is a global HE ranking edu-business based in the UK. In 1990, founder and current CEO, Quacquarelli Symonds, created QS as a startup business during his MBA from the Wharton School of the University of Pennsylvania (QS, 2019a). The company offered guides for international students interested in elite US universities. By 1994, QS was a UK corporation connecting university

admissions offices and prospective international students around the world. Now, QS self-describes as a leading higher education marketing company (QS, 2019b). QS lists many influential media partners, including the Guardians, IELTS, British Council, Times of India, and the New York Times. QS's mission is "to enable motivated people anywhere in the world to fulfill their potential through educational achievement, international mobility, and career development" (QS, 2019a). After ending its ranking collaboration with THE in 2009, QS developed a multitude of rankings, including its World University Ranking and rankings by subject, graduate employability, age of university, cities, and region (Elsevier, 2015). The current set of rankings includes 17 types, comparing various aspects of higher education institutions and systems (see Table 2). Ranking data primarily comes from reputation surveys and Elsevier's Scopus database (Elsevier, 2015; QS, 2019a). QS also offers institutional products and services, including consulting, marketing, and data analytics. And, like THE, QS took several decades to achieve this operational portfolio. QS oversees international conferences for higher education leaders, including Reimagine Education, EduData Summit, QS Apple, and a range of subject-focused summits held with partner universities.

As our Table 2 highlights, the variety and types of rankings has mushroomed among the Big Three GURs (particularly QS and THE), ranging from rankings that are global to subject-field oriented, to geographic-specific (i.e., regional or national), toward more technical oriented rankings (e.g., impact, teaching, or graduate employability), or specific institutional rankings (e.g., Young university). Such a growing variety of rankings reflects rankers "seeking ways to become attractive" to a variety of local markets, and have accommodated the latter "by creating new rankings that focus only on a smaller subset of the global rankings" (Lim and Oeberg, 2017, p. 103). Now that we have situated the Big Three GURs, in the following sections, we demonstrate how these GURs perpetuate GoK in two ways: (a) universalizing particular languages, and (b) reproducing colonial knowledge/power relations.

GURs and universality of quality and excellence

GURs perpetuate the geopolitics of knowledge through a universality project. This happens by universalizing particular languages of quality and excellence. By language, we're not simply referring to a communication medium, but also an onto-epistemic grammar that undergirds what is desirable, knowable, and valid as ways of knowing. We view language here as a system of representation, or conceptual map, that helps constitute the meaning of the world (Hall, 1997). Here we demonstrate how universality of quality and excellence is reproduced by furthering totalizing the English language, a "policy by numbers" heuristic, rankings language, and proxies of quality.

GURs feed the GoK by further universalizing the English language as the bastion of academic language. Many note that HEIs derived from English-speaking countries and/or former English colonies perform the best in GURs. For instances, Kaba (2012) noted that "six out of every ten universities on the top 200 list [in THE rankings] were located in countries that were at one time

partly or fully colonized by the United Kingdom" (p. 30), and Shin and Harman (2009) found research universities concentrated in English-speaking and more economically developed countries. GURs reinforces the universality of English in several ways. While GURs derive much of their legitimacy from claims of objectivity, GURs rely heavily on internationally recognized measures of research production, such as the number of scholarly articles included in the Thomson Reuters' Web of Science or Elsevier's Scopus databases, which are heavily biased toward English-language publications (Ordorika and Lloyd, 2015) (see Table 1). A dominant GURs culture results in devaluing research in the national language, as citation indexes referenced in GURs, are based predominantly on publications in English Language and does not acknowledge vernacular languages, especially in social sciences and humanities (Lo and Liu, 2021; Ishikawa, 2009). This has led to certain aspiring globally competitive nations and their HEIs to engage in English language initiatives, like English skills development in academic writing among faculty (e.g., Russia), or having more programs that utilize English, and/or wide-scale implementation of English in their institutions (e.g., Malaysia, China, and/or Japan) (Azman and Kutty, 2016; Dunrong, 2017; Pavlyutkin and Yudkevich, 2016).

GURs also foster GoK by universalizing a "policy by numbers" heuristic. By perpetuating the enumerative logic of counting and classification (Shahjahan, 2016), GURs feed colonial epistemological governance (Appadurai, 1996). The appeal for GURs finds fertile ground in the context of a transnational drive for evidence-based decision-making (Erkkila, 2014). Amidst this policy scape, GURs establish and assume a universal language of excellence/quality facilitated by a "practice of quantification" that is "applicable to all universities worldwide irrespective of location and sociocultural context" (Brankovic et al., 2018, p. 277). Rankings also serve as calculative practices making characteristics, actions, and positions of individuals and institutions legible, thereby actively extending a numerical imagination of the world (Collins and Park, 2016). GURs serve policy-making by numbers through framing decision-making and resource allocation (Hazelkorn, 2018). As such, GURs have increasingly shifted from being a statistical-technical phenomenon, influencing institutional decision-making, toward a policy instrument driving competition at institutional, national, and global levels (Hazelkorn, 2018). Such statistics and book-keeping can create an "iron cage" that leaves no other option but to submit to their calculative logic—limiting the realm of politics and ethics (Erkkila, 2014).

Tied to epistemological governance, GURs perpetuate the GoK by universalizing the ranking language as proxies of quality. Such language is underpinned by a zero-sum game of winners and losers with no total gain or loss, in which resources gained by one party (i.e., ranking position) are matched by corresponding losses to another party (Lee et al., 2020a,b). GURs thus presume a nonexistent zero-sum game by arbitrarily creating limited spots for top ranks (Lee et al., 2020a,b). Using tables, GURs also allocate universities hierarchically according to "how much excellence" they have, and in so doing, GURs suggest "that the vertical slots allocated merely reflect "the objective reality" when it comes to performance: (a) not all universities can be equally good and (b) the better a university, the higher its slot" (Brankovic et al., 2018, p. 280). GURs thus indexes global higher education in a language of single logic and reductionism. By signifying qualities as numbers, rankers validate their zero-sum statement in unambiguous terms and provide a means of public comparison that is audience-friendly (Brankovic et al., 2018, p. 274). As we will demonstrate, such ranking language is furthered in global HE through the mediatization of GURs among the mass media and institutional branding efforts.

GURs also universalize by fixing the meaning of quality, thus perpetuating the GoK. The locus of articulation of quality is slowly shifting from local HE to the global (that derive from particular local histories). As we demonstrated earlier, each GUR has its own history and particular vision of university excellence, advancing that notion, and their methodological construction favors certain types and nationalities of institutions (Lim and Oerberg, 2017, p. 100). First, GURs presume that the highest standard of quality of performance is something that can be universally defined, objectively captured and ascribed to HEIs of all stripes, and further measured, compared and communicated to an audience (Brankovic et al., 2018, p. 277). Second, GURs' notions of quality are diffused because of the geopolitics of HE, whereby GURs play an important role in an academic olympiad. National pride and reputation also include the quality of human capital formation, which are predetermined by the leading positions of the leading national universities in GURs (Avrilev and Efimova, 2013). Thus, the state's position in the world largely depends on the positions held by its leading universities in the world. As such, the notion of quality higher education is being transformed from something being institutionally led to being driven and regulated by the state, and now a critical part of international HE, and rankings become convenient report cards (Hazelkorn, 2018). GURs are perceived as an international measure of quality, especially in developing countries, particularly given some nation states don't have HE quality assurances in place, hence GURs serve as those tools (Hazelkorn, 2018). Third, GURs count what is measured rather than measure what counts. In other words, as mentioned earlier, the availability of data becomes the means of defining quality, such as only those indicators which are available and can be measured and counted are used (e.g., research, reputation, learning environments, etc.) (Altbach and Hazelkorn, 2018; Kehm, 2014). In particular, GURs put emphasis on research performance and then make statements about the quality and performance of the institution as a whole (Kehm, 2014).

GURs and colonial knowledge/power relations

Here we demonstrate how GURs reinforce existing hierarchical knowledge systems and produce subjectivity intertwined with colonial/knowledge power relationships. We show how GURs orient HE stakeholders (e.g., government, institutions, faculty, leadership, and students) toward certain parameters of success.

GURs perpetuate the GoK utilizing the stakeholders' aspiration for Anglo-American types of institutions. The Big Three have demonstrated consistently similar top ten institutions in each of their annual rankings. The two of the 10 universities came from Southern England (Oxford and Cambridge), and the rest came from the USA (i.e., Caltech, Stanford, Berkeley, Columbia, Yale, Princeton, MIT, Harvard, and University of Chicago). These wealthy institutions have endowments and access to major media centers (Stack, 2020). While some universities are public, all are research-intensive, with diversified funding, entrepreneurship culture, and wide international collaboration. They perpetuate an Anglo-American university model, as an increasing number of countries attempt to imitate the HE system of the US and UK (Kaba, 2012). For instance, China planned to have 20 top universities that match MIT; Nigeria hoped for 20 world-class universities (WCUs); Sri Lanka wants at least one WCU; Japan's Ministry of education has targeted 30 universities becoming world-class institutions (Douglass, 2014). Beyond exemplifying Anglo-American institutional types, GURs privilege metropolitan centers of knowledge within nation-states. For instance, QS Best Student Cities rankings (see Table 2) distinguishes large urban, world-class cities (e.g., Tokyo, Paris, Berlin, Beijing, and Seoul) with highly ranked institutions at the expense of less developed cities (with exceptions in the US) (Shattock, 2017).

Governments play a major role in reproducing the GoK. Governments strive to belong to the "international" community, assert their "humanity", or demonstrate "quality" through WCU initiatives. Interestingly, the concept and diffusion of WCU was an idea popularized at the global scale by a World Bank staff member Jamil Salmi, and its Tertiary Education Program (Salmi, 2009). Salmi's (2009) book, *The Challenge of Establishing World Class Universities*, published by the World Bank, shaped national understandings of what "top" universities ought to do and their special role for economic development (Allen, 2019; Lim and Oerberg, 2017). Such a WCU concept both relied on and shaped the criteria of different rankers, thus reproducing GoK. As mentioned above, many governments and institutions worldwide heavily invest in WCU initiatives within their respective higher education sectors to "catch up" with Anglo-American institutional models (Dembereldorj, 2018; Collins and Park, 2016; Kim et al., 2018; King, 2009; Lee and Naidoo, 2020; Lo and Liu, 2021; Makinen, 2021). Government-driven WCU initiatives range from mergers of smaller institutions to larger ones (e.g., France and Russia), internationalization efforts (e.g., Japan and South Korea), funding initiatives focusing on an exclusive number of national universities to attract academic stars and increase their publication outputs in indexed journals (e.g., China and Korea), build up research infrastructure (through research centers) (e.g., Germany and Japan), and/or through competitive student admissions, infrastructure construction and seeking strategic partnerships with highly ranked institutions (e.g. Malaysia or Kazakhstan). Furthermore, other countries have attracted WCUs from elsewhere to create "hubs" to set up operations locally and establish joint ventures with their domestic counterparts (e.g., Singapore) (King, 2009). In developing countries and middle-income countries, the priority has been to build research-intensive universities (Dembereldorj, 2018; Kiraka et al., 2020; Lee and Naidoo, 2020). For instance, Nazarbayev University, in Kazakhstan, was created by the decree of the president N. Nazarbayev (Ruby et al., 2017; Sabzalieva, 2017), and similarly the Malaysian government invested in the Universiti Sains Malaysia to attain international stature (Lee and Naidoo, 2020). Based on the examples, national policymakers are active participants in accepting and reinforcing the Anglo-Saxon model of higher education. While national actors, such as Russia, India, Brazil, and China, express concerns over the hegemonic influence of GURs, their HE sectors nonetheless reflect the influence of ranking's paradigm (Lloyd and Ordorika, 2021; Makinen, 2021; Shahjahan et al., 2021). In short, governments representing former imperial powers, colonies, and/or those desiring to take on the new imperial role (Rhee, 2009), seek to improve their global status through WCU initiatives tied to GURs.

Coupled with the national priorities to establish WCUs, ranking agencies advise governments globally co-partnering in HE policy interventions amplifying the GoK. *THE*, for instance, provides advising to governments on the development of institutional programme activity supporting the United Nations Sustainable Development Goals and World Bank Tertiary Education program (THE, 2019). UNESCO, together with the Organization for Economic Co-operation and Development (OECD) and the World Bank, organized the Global Forum on Rankings and Accountability in Higher Education: Uses and Misuses in 2011. The organizers pursued the goal to build capacity for responsible development, dissemination, and informed use of rankings (Marope et al., 2013). Therefore, the governments' cooperation with ranking agencies to reform higher education systems represent higher education policy interventions promoting dominant policy scripts, best practices (Kehm, 2014) and crypto-currency of "world-classness" (Hazelkorn, 2018, p. 19). The cases of Denmark and India demonstrated examples when ranking agencies become "closely involved into national policy discourses, and moved beyond a technical practice measuring performance to become a technology of government with only limited control" (Lim and Oerberg, 2017, p. 104). Similarly, in the case of Kazakhstan, ranking logic was introduced and supported by the QS agency who was actively involved in the promotion of their ranking system among national universities (Anafinova, 2020). Finally, GURs through affective infrastructure, including HE gatherings, virtual interactions, fact-finding visits, and fairs, shape the trends mobilizing *emoscape* binding national HE orientations for best practices (Shahjahan et al., 2020, 2022). As the affect circulates through government affective infrastructures, rankings accumulate value, furthering its power to shape policy. For example, QS rankings have eleven high-level international events scheduled in 2020–21, including QS Maple conference, Edu-Data Summit, and others that will take place online due to the COVID-19 virus (QS, 2020a).

GURs foster monocultures of institutional missions, causing deterioration of public good values and institutional autonomies and reproduce GoK. GURs establish a universal framework of comparison through rankings, such as their global rankings, but also through regional rankings (e.g., QS University Rankings by region, or THE Asia University rankings) (see Table 2). As a result, increasingly elite and selective universities need to perceive themselves as global actors, rather than just national institutions connected to local traditions and histories (Brankovic et al., 2018). Homogenizing institutional goals on the global scale at the expense of local agendas and missions, GURs inadvertently reproduce "cultural imperialism" depriving individual institutions and higher

education systems of autonomy and legitimacy in the eyes of the public stakeholders (Lloyd and Ordorika, 2021; Ishikawa, 2021). For instance, the Pontifical Catholic University in Chile increasing quest for global ranking positioning has led to increasing internationalization efforts, which clash with other university missions such as national and local community building (Veliz and Marshall, 2021). Furthermore, in a recent study of strategic plans among 78 Institutions from 33 countries, typifying high ranked, mid/low ranked, and unranked institutions, Lee et al. (2020a,b) found that top ranked HEIs are less explicit about their locally focused third mission compared to mid/low and unranked institutions. In short, GURs tend to reconfigure the mission from a national institution serving the public toward a corporate entity guided principally by global performance (Collins and Park, 2016, p. 126), that in turn help reproduce a global elite class.

GURs reorient periphery faculty success strategies toward metropolitan centers of knowledge. As Table 1 highlights, GURs conduct an institutional evaluation based on cumulative faculty research productivity and citation indices (see also Allen, 2019; Stratilatis, 2014). More specifically, the weight of indices measuring faculty research productivity ranges between 20% and 40% among the Big Three (see Table 1). Further, institutions recognize faculty with a higher number of research publications and faculty winning Nobel Prizes and Fields Medals, rather than their colleagues primarily focusing on teaching (see Table 1). The institutional evaluation of GURs results in faculty reputation hierarchization. The institutions use impact factor as a criterion in faculty hiring, promotion, distribution of research funding, and administration of institutional evaluations (Stergiou and Lessenich, 2014). As a result of reputational hierarchization and structural changes, faculty demonstrate increasing rank-seeking behavior to become more visible and consolidate individual benefits and social capital (Hazelkorn, 2018). Thus, GURs reconfigure faculty subjectivity through modification of work orientations and create a situation of competition between faculty within an institution and between faculty representing different institutions globally.

GURs undervalue research contribution of faculty publishing in non-English language regions. This academic misrepresentation constitutes the second tier of faculty hierarchization based on language differences between the center and periphery reproducing colonial/knowledge power relationships (Ordorika and Lloyd, 2015). Faculty hierarchization becomes further exacerbated through disciplinarian relatedness of faculty to “internationally competitive natural sciences” and diminishing “parochial social sciences” (Ishikawa, 2009, p. 170). In particular, unlike their colleagues in STEM, faculty in the social sciences and humanities are stigmatized as less technologically oriented, scientifically inefficient, stifling international reputation and return on investment (Lloyd and Ordorika, 2021; Ishikawa, 2021; Lo and Liu, 2021). The hierarchization of academic disciplines shifts the balance of power and distribution of funding between natural sciences/engineering and humanities/social sciences faculty. Taken together, GURs’ approach disadvantages faculty publishing in the national languages and in social sciences and humanities. These phenomena have been defined as subaltern positions (Grosfoguel, 2002) or subaltern sides of colonial difference (Delgado et al., 2000). Faculty in the subaltern positions experience unconscious self-colonization, submit to the dominant paradigm, and unquestioningly adapt knowledge to local narrow utilitarian needs (Mignolo and Tlostanova, 2012).

Institutional leaders confirm they take rankings seriously and incorporate them into strategic planning processes, institutionalizing principles of GoK. University leadership are rarely just passive recipients of rankings, but they monitor and leverage them to their strategic advantage, especially when the ranking benefits their institutional visibility (Veliz and Marshall, 2021). For instance, 84% of surveyed higher education institutions from 41 different countries have established a formal internal mechanism to monitor institutional rank on a regular basis (Hazelkorn, 2008). Furthermore, in 40% of these cases, the Vice Chancellor, President, or Rector coordinated the tasks (Hazelkorn, 2008). In addition to the input metrics, administrators create narratives legitimizing and manipulating the rankings to better position institutions in the global lists (Heffernan and Heffernan, 2018). In some cases, the institutional leaders had to pay attention to rankings since the institutional performance in rankings influenced their salary, career growth, or justified claims on resources (Rauhvargers, 2013). While rankings have no norm-driving authority over university officials, they increasingly frame institutional policy making (Erkilla, 2014). Thus, university officials further reinstall policy scripts of GOK through marketing, institutional policies, and information sharing using GURs.

Media and mediatization principles operating in the context of GURs represent an instrument significantly contributing to the reproduction of GoK. Mass media heavily advertise GURs globally (Stergiou and Lessenich, 2014). Furthermore, in an era of the digital revolution, mass media provide instant planetary communication of ranking information among major stakeholders (Shahjahan et al., 2020, 2022). The global impact of GURs is based upon the use of several mediatization principles such as: (a) temporal aspect of repeated publication, (b) simplicity of visual order and quantified comparisons of league tables, and (c) regular publications in different social fields on a continuous basis (Brankovic et al., 2018; Stergiou and Lessenich, 2014; Yudkevich et al., 2015). Furthermore, national media play an important role in localizing GURs, allowing GURs to persevere despite their questionable legitimacy in various national contexts, thus globalizing higher education policy (Barats, 2020; David, 2016; Shahjahan et al., 2021). Through the mediatization principles, GURs artificially construct a social situation of competition between universities for the status of global excellence, which is visible, easily comparable, and continuously dynamic.

Finally, HEIs contribute to media circulation of rankings through their branding efforts (e.g., university websites, social media, and brochures) that reproduce specific policy scripts (Stack, 2016). HEIs are not only objects of ranking evaluation, but they find opportunities to regain some power by creating discourses to represent themselves in a positive light (Heffernan and Heffernan, 2018; Lo and Liu, 2021). HEIs are increasingly contracting commercial rankers such as THE and QS for services to improve their rankings, such as: advertising, access to additional ranking data and analytics, consulting (typically for branding, quality-improvement, and reporting strategies), and access to events and workshops (Chirikov, 2021; Shahjahan et al., 2020, 2022). To this end, for instance, Russian universities spent \$3,871,378 on QS services during the period between 2013 and 2020 (Chirikov, 2021, p. 5). Universities also engage in language games to counterbalance the scientific data of rankings through legitimizing and

manipulating their ranking (Brankovic et al., 2018; Heffernan and Heffernan, 2018). For instance, the National University of Singapore ranked 24th in the *THE* world rankings represented itself as “Top in Asia,” and repositioned institutional ranking as being number one at the regional level (National University of Singapore, 2016). Unfortunately, in some cases, HEIs seek to “game the system” and engage in unethical practices to improve their public image (Ordorika and Lloyd, 2015). By adopting ranking language games, HEIs nurture the second cycle of ranking mediatization by further intensifying global competition not only among already ranked institutions but also among all non-participating institutions in rankings.

Concluding remarks

As we demonstrated, GURs have introduced new complex dynamics into global higher education that stifle attaining diversity and global justice in education. As the HE sector continues to be globalized (e.g., increased connections, exchanges, and movements, albeit unevenly distributed), and the sector becomes more complex and difficult to tame and name, GURs become convenient tools to inform decision making across stakeholders and scales. Many “crave” the simplicity and certainty such rankings provide. Yet such “cravings” are not simply natural or inevitable. Such desires for rankings are historically contingent, political, and are produced by various actors, including rankers themselves. Given its unprecedented attention, we demonstrated how GURs reproduce GoK in two ways. First, they perpetuate GoK through universalizing particular languages of excellence and quality, ranging from the English language in scholarship and teaching and learning to policy by numbers, and/or proxies of quality. Second, GURs reinforce existing hierarchical knowledge systems and produce subjectivity intertwined with colonial/knowledge power relationships. We highlighted how HE stakeholders (e.g., government, institutions, faculty, leadership, and students) acquiesce to such GURs, as GURs provide an orientation to be followed and perceived as successful. In short, GURs perpetuate the GoK by normalizing a principle of calculability (Welsh, 2019), reconfiguring social relations and knowledge practices, and shaping subjectivity using the enticing soft-power of modernity/coloniality (Lo, 2011; Shahjahan et al., 2017).

The GoK frame allows us to foreground the colonial logics underpinning the *principle* of rankings (Shahjahan et al., 2017; Welsh, 2019) that has grave consequences for attaining global justice in education. As we demonstrated, coloniality/modernity assumptions such as universality, causality, rationality, and Enlightenment notions of progress, underlie the practice of GURs. A GoK frame gestures us toward raising questions about ontological securities, status, and privileges afforded to us via HEIs and their rankings. It also cautions against universalist tendencies of such solutions that trap us back in modernity logics (Shahjahan et al., 2017), that have proved historically to have grave consequences for the colonized Other. GURs not only impact the structural changes in global HE, but they also have important consequences for ontological governance, in constituting and reproducing particular ways of knowing and being, i.e., a calculating way of being (Shahjahan, 2020). For instance, the use of GURs raises the question: why do we increasingly crave and depend on selective “data” to orient our realities and decision making? As such, GURs simply and complexly reproduce a way of knowing and being that views quantifiable “data” as a means to secure worthiness and assurance in the quest to control one’s futurity, and is embedded in affective and short-term temporal investments.

Finally, in contesting the global politics of knowing and being in contemporary global HE, we cannot ignore GURs, but we cannot bend to its will either. Our analysis of GURs from the GOK standpoint highlights the importance of the colonial knowledge/power relations constituting global politics of knowing and being. By “attending to what is habitual and routine in ‘the what’ of the world” (i.e. rankings, or notions of excellence or quality, or “world class”), our analysis highlights how we continue to be “stuck” in colonial/modernity paradigms, and to decolonize education, requires moving beyond “wishing for new tricks” (Ahmed, 2007, p. 165). Amid globalization of HE tied to asymmetrical movements, networks, and untethered economies furthering colonial power relations and cultural imperialism (Sidhu, 2006; Shahjahan, 2019), the global politics of knowing and being cannot be separated from the global divisions of labor, racial/ethnic hierarchies, and hegemonic modern epistemologies. GURs hinder global justice in education through establishing and maintaining reputation hierarchies, linguistic and social-ideological biases, and concentrations of financial resources. The standard of humanity has shifted from a colonial era’s theological model (Does one have a soul?) to the secular scientific model (Can one think?) to the developmental model (Is one civilized?) to today’s global model (are we world class?) perpetuating colonial difference (Shahjahan, 2016). Often conflated with diversity, democracy, and social justice projects in education, our analysis suggests moving beyond simple or drastic interruptions of the business as usual, and/or institutional/social reform focused on redistribution, recognition, or representation (Andreotti et al., 2018). Instead, to achieve “diversity” and “justice” in education, we need to challenge and address the global politics of knowing and being by denaturalizing “forms of existence framed” by modernity/colonial ways of being (Andreotti et al., 2018). In short, we suggest considering alternative ways of knowing and being, that are rendered invisible through modernity/coloniality paradigms such as the principle of rankings.

Acknowledgment

We would like to thank Ryan Allen, Hoda Abdelrahman, Kairat Kurakbayev, Naseeb Bhargal, and editors of this volume, for their comments on earlier drafts of this manuscript.

Discussions within the field of recognition and reconciliation politics, however, rarely treat emotions like anger and resentment even-handedly.

Coulthard (2014, p. 111)

To do this, we need a new social contract for education that can repair injustices while transforming the future.

UNESCO (2021)

What is truth? And, who gets to story historical truths? Or, even contemporary truths for that matter? Several nation-states have created a discursive regime supported by their educational systems and respective curriculum to teach us how to forget historical truths. The media and politicians spin truths to serve their versions of the public good. And yet, several Indigenous Peoples across the world continue to experience the intergenerational historical and contemporary harms of European settler colonial violence in Australia, Brazil, Canada, New Zealand, Australia, South Africa, and United States. That is a truth. In turn, Indigenous Peoples¹ have been strategically calling for settler colonial governments and their citizens to recognize and acknowledge the ongoing cultural, ecological, economic, emotional, material, and psychological legacies of such historical and contemporary harms. And yet, settler nation states have been slow to recognize, respond, or react in terms of their different relational commitments and/or promises to different Indigenous Peoples. And when “they” do, it often begins with official state sponsored apologies followed by commitments to policy enactments of truth, and then reconciliation education.

Part of such “a contemporary international trend,” is as Czyzewski (2011) writes, “the notion that a more inclusive citizenship, as well as reconciliation, can be achieved through truth-telling and subsequent public education about ‘past’ injustices” (p. 1). Indeed, truth-telling, redressing history harms, and public education have become overarching objectives of various international Indigenous-settler reconciliation initiatives, including those of the TRC in Canada (2015), the TRC in South Africa (Regan, 2010), the Waitangi Tribunal in Aotearoa, New Zealand (Joseph, 2008), and the Human Rights and Equal Opportunity Commission in Australia (Simon, 2013). In Canada, First Nations, Inuit, and Métis Survivors of colonial injustices have long-called for the truths that they have courageously shared to be taught in schools across the country. In response, there is a growing reconceptualization of how historical truths “ought” to be taught in response to such historical harms (Regan and Craft, 2020; Madden, 2019; Wallace-Casey, 2022; Llewellyn and Ng-A-Fook, 2020). And yet, how might such truth-telling be re-storied as part of a new social contract for education?

Today, several government institutions and citizens in different parts of the world continue to deny or distance themselves from the violent history and legacy of settler colonial harms. Such active distancing from historical “truths” affords the intergenerational beneficiaries of settler colonialism, including some educators, to superficially recognize the lived experiences of Indigenous Peoples (Coulthard, 2014; Ng-A-Fook, in-press). “The contemporary context of reconciliation is also an opportunity,” as Stein reminds us, “to reconsider what the Canadian university should or could be, including in ways that go beyond defenses of the ‘public good’ of higher education if that ‘public’ is still presumed to be the citizenry of an otherwise unchanged colonial society” (p. 159). Consequently, there is much work to be done within and across different educational systems. In response, what we have witnessed since the turn of the 21st century, is an emerging field of educational studies that has and is focusing on truth and then reconciliation education. Several of these scholars and, their educational research, seek to create curricular and pedagogical opportunities for living a new social contract toward repairing historical and contemporary injustices while transforming and reimagining our future relations

¹We use the term Indigenous internationally, “First Nations, Inuit, and Métis” to describe people who are Indigenous to Canada, and specific names of Nations and communities when possible. The word “Indigenous,” though currently in popular usage in Canada, is latin-derived and not Indigenous itself (Peters and Mika, 2017). Furthermore, the term Indigenous tends to homogenize rather than recognize. We have kept the term Indigenous when it is used in a citation or reference.

beyond settler colonial moves to innocence. In this chapter then, we offer a partial and situated overview of the possibilities and limitations of such scholarship in response to what others have called a neoliberal *Age of Apology* here in Canada (Henderson and Wakeham, 2013). We conclude with a brief discussion about different research taking place among A Canadian Curriculum Theory Project research team in response to the emerging field of truth, and then reconciliation education research.

An age of apology: sorry as a neoliberal paradigm

Responding to the growing demand from communities for redress, states have increasingly relied on transitional justice mechanisms—such as truth commissions—to engage in action of performative morality as they seek to contend with their own histories of violence.

George (2020, p. 87)

Since the end of the second world war, political apologies have become increasingly common (Organick, 2020), with the *Institute for the Study of Human Rights* (2022) recording 815 political apologies during this time period. The fact that 79% of these apologies have been issued since 1996 has prompted many to refer to the last 25 years as “the age of apology” (Sanz, 2012, p. 3). Political apologies are referred to as state apologies, national apologies, historical apologies and a myriad of other terms. They are often made by politicians on “behalf,” as Sanz (2012) suggests, “of and directed to identifiable communities for past wrongdoings by the modern-state” (p. 10). State sanctioned apologies seek to address reparations of past harms (Edwards, 2010), re-righting past beliefs and their corresponding harmful actions (Nobles, 2008), and to promote peace, mutual confidence, and stabilization (Sanz, 2012). While many governments offer state sanctioned apologies, others in turn also establish commissions, which have focused on restorative justice, accountability, human rights, and compensation (Ibhawoh, 2019). Indeed, over the past three decades, more than forty countries have established truth (and reconciliation) commissions such as, but not limited to, South Africa, Australia, Sierra Leone, Chile, the Philippines, South Korea, Canada, and Rwanda (Ibhawoh, 2019). In the aftermath of the 1994 Rwandan genocide for example, in which an estimated 800,000 members of the minority Tutsi population were killed by Hutu extremists, the government attempted to promote a policy of national unity and reconciliation (Jessie, 2012). However, as Jessie (2012) cautions, many survivors feel that:

... reconciliation with their neighbours, many of whom were allegedly complicit, if not directly responsible, for the harms visited upon them during the genocide, is impossible. In particular, survivors argue that there can be no reconciliation until those responsible for murdering their missing loved ones reveal the locations where their bodies have been deposited so they can be identified and reburied with respect according to Rwandan tradition. (p. 7)

The ongoing reconciliatory challenges in Rwanda remind us that lived experiences of the intergenerational survivors of genocide must be central to truth, and then ensuing reconciliation efforts. However, in many ways, this current age of apology and the very “ideas” of truth and then reconciliation have become a social paradigm that often fails to directly address the harms and concerns of survivors (Henderson and Wakeham, 2013). In turn, settler movements for redress have become entrenched in 21st century frameworks of neoliberal settler colonial democracies.

Neoliberalism and redress: historicizing past injustice

Liberal reconciliation frames are designed to settle the settler within, without, in fact, requiring the settler to acknowledge themselves as a settler or to reflect on a relational and inherited coloniality with Indigenous peoples.

MacDonald (2020, pp. 7–8)
